---

Can either of you help with this? OMNNI tried to contact Dan Reid over a month ago and hasn't gotten a response.

Thanks,

Rich

Rich,
We are trying to have Dan check his GPR profiles. The County has drilled some test holes and have not found anything. They want to make sure they are looking in the right location. They plan to remove the tank prior to construction. Any assistance you can give would be helpful.
Peg

Hi, Dan,

I am having a senior moment, and don't recall whether you got back to me on this. I can't find any email or phone log.

At the Sipple site, 1016 Main St., St. Cloud, we believe that an underground storage tank bed was located in the street right-of-way. Your work found an anomaly, but our subsequent work has not been definitive on whether a tank bed or tank exists within the ROW.

Could you check your profiles again? We're trying to pin down the location of the profile with the anomaly - how far north of the north edge of the Sippel driveway, and whether it was directly below the sidewalk, or potentially west of the ROW on the Sippel property. Thanks.

Don

Don,
Thanks for the email. I am out in the field for most of this week but will look at GPR data and anomalies when I get back in the office on Monday. Based on your comments, I would guess that 1 or more of my GPR profiles also caught the edge of the pea gravel or fill material and could be the source of the anomalies in this area. I will check this out.

Thanks.
Dan

> I wanted to confirm that your transect numbering and results were as reported. I assume they were. If they are correct, the anomaly is under the sidewalk, and about 18 feet long. Fond du Lac County bored under the sidewalk in the area of the linear anomaly, but didn't find anything. Previously, I had placed a temporary well immediately east of the sidewalk near the center of the anomaly, and encountered pea gravel from 10 – 12.5 feet below the surface, so I thought I may have nipped the east edge of a former tank bed.
>
> In the past, we have found 500-gallon – 1,000-gallon underground storage tanks in these street situations. 500-gallon tanks are typically 4' x 6', and 1,000-gallon tanks are typically either 4' x 11' or 5.5' x 6'.
>
> Please let me know if you find any errors in the placement of the linear anomaly. Fond du Lac County is willing to remobilize if necessary. Thanks.

> We bored 9 – 9inch diameter holes 5' – 6' deep this morning and found no evidence of a tank or contaminated soils. The soil profiles from all 9 holes suggests no recent soil disturbance below about 2 feet. The auger is drilling at the site of B06 in the attached photo and seven other backfilled holes can be seen as well. Why does the GPR show a 20' long anomaly but on the phone Don only expected us to find a 4' diameter tank? I appreciate any double checking that you do to confirm that we were poking around in the correct area and not that the GPR reference line got accidently reversed or some other simple mistake.

> I reviewed the reports very briefly. On occasion, there is the recommendation that special provisions be developed to detail soil staging and testing during construction. If we need additional detail to define limits of contaminated soil and groundwater that would reduce the need for staging/additional analytical work during construction, we could do a Phase 2.5 to get that information. May also be a good means to be proactive at the site(s) where the county may be the RP.
