FINDS:

Registry ID: 110005530559

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Action Name: Closure Review Fee Received
Action Desc: Date DNR received fee for closure review.
Action Comments: REC'D CK #27875 $1050.00

Action Date: 04/01/2015 Action Code: 300
Action Name: Informal Review Performed for a Non-Fee Related Submittal
Action Desc: Date the informal/expedited review was completed for a non-fee related submittal. Please see action comment which indicates if Project Manager response was provided by phone or email.
Action Comments: REVIEWED

Action Date: 01/15/2016 Action Code: 198
Action Name: Request for Additional Information (Fee-Based or Closure)
Action Desc: Date DNR requests additional information in order to make a determination on a fee-based or closure submittal.
Action Comments: REQ'D ADD'L INFO

Action Date: 12/23/2015 9:21:37 AM Action Code: 79
Action Name: Closure Review Request Received
Action Desc: Date DNR Project Manager determined that the Case Closure - (Form 4400-202) submittal was administratively complete and a review can begin. Fees have been paid for the review.
Action Comments: AUTO-ENTERED

Action Date: 06/09/2016 Action Code: 100
Action Name: CO Packet and GIS QAQC Completed
Action Desc: Date that this site had the Continuing Obligations Packet and GIS QAQC completed.
Action Comments: RS

Action Date: 05/05/2016 Action Code: 11
Action Name: Activity Closed
Action Desc: Date the Closure Letter or No Further Action letter is sent.

MILWAUKEE DUCTILE IRON PARCEL 5 (Continued) **S113870907**

Action Comments: Not reported

Action Date: 05/05/2016 Action Code: 222
Action Name: Continuing Obligation - Maintain Cap Over Contaminated Area
Action Desc: Closure or ongoing cleanup was approved with the requirement to maintain a cap or cover to protect against exposure to contaminated soil (direct contact) or to reduce the movement of residual contamination in soil or groundwater.
Action Comments: Not reported

Action Date: 05/05/2016 Action Code: 232
Action Name: Continuing Obligation - Residual Soil Contamination
Action Desc: Closure or ongoing cleanup was approved with the Continuing Obligation to address residual soil contamination at or above the Residual Contamination Level (RCL) or Site Specific Residual Contaminant Level (SSRCL) per rules, when moved.
Action Comments: Not reported

Action Date: 05/05/2016 Action Code: 56
Action Name: Continuing Obligation(s) Applied
Action Desc: Closure or ongoing cleanup was approved with one or more Continuing Obligations to give notice of residual contamination; require or restrict certain actions to protect the public or environment; minimize human or environmental exposures.
Action Comments: Not reported

Action Date: 05/03/2016 Action Code: 199
Action Name: Additional Information Received (Fee-Based or Closure)
Action Desc: Date DNR received the additional information that it had requested in order to make a determination on a fee-based or closure submittal.
Action Comments: Not reported

Facility name: G E MEDICAL SYSTEMS ELECTRIC AVE FACILITY
Facility address: 4855 W ELECTRIC AVE
WEST MILWAUKEE, WI 53219
EPA ID: WID086686003
Contact: CHAD PEPLINSKI
Contact address: 4855 W ELECTRIC AVE
MILWAUKEE, WI 53219
Contact country: US
Contact telephone: 414-647-7874
Contact email: CHAD.PEPLINSKI@GE.COM
EPA Region: 05
Land type: Private
Classification: TSDF
Description: Handler is engaged in the treatment, storage or disposal of hazardous waste
Classification: Large Quantity Generator
Description: Handler: generates 1,000 kg or more of hazardous waste during any calendar month; or generates more than 1 kg of acutely hazardous waste during any calendar month; or generates more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month; or generates 1 kg or less of acutely hazardous waste during any calendar month, and accumulates more than 1 kg of acutely hazardous waste at any time; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulates more than 100 kg of that material at any time

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste name: LEAD

. Waste code: D009
. Waste name: MERCURY

. Waste code: D011
. Waste name: SILVER

. Waste code: D035
. Waste name: METHYL ETHYL KETONE

. Waste code: D040
. Waste name: TRICHLORETHYLENE

. Waste code: D043
. Waste name: VINYL CHLORIDE

. Waste code: F001
. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLORETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F002
. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND

G E MEDICAL SYSTEMS ELECTRIC AVE FACILITY (Continued) **1000199988**

SPENT SOLVENT MIXTURES.

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F005
. Waste name: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F007
. Waste name: SPENT CYANIDE PLATING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS.

. Waste code: F008
. Waste name: PLATING BATH RESIDUES FROM THE BOTTOM OF PLATING BATHS FROM ELECTROPLATING OPERATIONS IN WHICH CYANIDES ARE USED IN THE PROCESS.

. Waste code: F009
. Waste name: SPENT STRIPPING AND CLEANING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS IN WHICH CYANIDES ARE USED IN THE PROCESS.

. Waste code: F017
. Waste name: Not Defined

. Waste code: F018
. Waste name: Not Defined

. Waste code: K001
. Waste name: BOTTOM SEDIMENT SLUDGE FROM THE TREATMENT OF WASTEWATERS FROM WOOD PRESERVING PROCESSES THAT USE CREOSOTE AND/OR PENTACHLOROPHENOL.

. Waste code: K002
. Waste name: WASTEWATER TREATMENT SLUDGE FROM THE PRODUCTION OF CHROME YELLOW AND ORANGE PIGMENTS.

. Waste code: K003
. Waste name: WASTEWATER TREATMENT SLUDGE FROM THE PRODUCTION OF MOLYBDATE ORANGE PIGMENTS.

. Waste code: K004
. Waste name: WASTEWATER TREATMENT SLUDGE FROM THE PRODUCTION OF ZINC YELLOW PIGMENTS.

. Waste code: K005

G E MEDICAL SYSTEMS ELECTRIC AVE FACILITY (Continued) **1000199988**

. Waste name: WASTEWATER TREATMENT SLUDGE FROM THE PRODUCTION OF CHROME GREEN PIGMENTS.

. Waste code: K006
. Waste name: WASTEWATER TREATMENT SLUDGE FROM THE PRODUCTION OF CHROME OXIDE GREEN PIGMENTS (ANHYDROUS AND HYDRATED).

. Waste code: K008
. Waste name: OVEN RESIDUE FROM THE PRODUCTION OF CHROME OXIDE GREEN PIGMENTS.

. Waste code: K009
. Waste name: DISTILLATION BOTTOMS FROM THE PRODUCTION OF ACETALDEHYDE FROM ETHYLENE.

. Waste code: K010
. Waste name: DISTILLATION SIDE CUTS FROM THE PRODUCTION OF ACETALDEHYDE FROM ETHYLENE.

. Waste code: K015
. Waste name: STILL BOTTOMS FROM THE DISTILLATION OF BENZYL CHLORIDE.

. Waste code: K016
. Waste name: HEAVY ENDS OR DISTILLATION RESIDUES FROM THE PRODUCTION OF CARBON TETRACHLORIDE.

. Waste code: K018
. Waste name: HEAVY ENDS FROM THE FRACTIONATION COLUMN IN ETHYL CHLORIDE PRODUCTION.

. Waste code: K019
. Waste name: HEAVY ENDS FROM THE DISTILLATION OF ETHYLENE DICHLORIDE IN ETHYLENE DICHLORIDE PRODUCTION.

. Waste code: K020
. Waste name: HEAVY ENDS FROM THE DISTILLATION OF VINYL CHLORIDE IN VINYL CHLORIDE MONOMER PRODUCTION.

. Waste code: K021
. Waste name: AQUEOUS SPENT ANTIMONY CATALYST WASTE FROM FLUOROMETHANE PRODUCTION.

. Waste code: K022
. Waste name: DISTILLATION BOTTOM TARS FROM THE PRODUCTION OF PHENOL/ACETONE FROM CUMENE.

. Waste code: K027
. Waste name: CENTRIFUGE AND DISTILLATION RESIDUES FROM TOLUENE DIISOCYANATE PRODUCTION.

. Waste code: K028
. Waste name: SPENT CATALYST FROM THE HYDROCHLORINATOR REACTOR IN THE PRODUCTION OF 1,1,1-TRICHLOROETHANE.

. Waste code: K029
. Waste name: WASTE FROM THE PRODUCT STEAM STRIPPER IN THE PRODUCTION OF 1,1,1-TRICHLOROETHANE.

. Waste code: K036
. Waste name: STILL BOTTOMS FROM TOLUENE RECLAMATION DISTILLATION IN THE PRODUCTION

G E MEDICAL SYSTEMS ELECTRIC AVE FACILITY (Continued) **1000199988**

OF DISULFOTON.

. Waste code: K037
. Waste name: WASTEWATER TREATMENT SLUDGES FROM THE PRODUCTION OF DISULFOTON.

. Waste code: K046
. Waste name: WASTEWATER TREATMENT SLUDGES FROM THE MANUFACTURING, FORMULATION, AND LOADING OF LEAD-BASED INITIATING COMPOUNDS.

. Waste code: K048
. Waste name: DISSOLVED AIR FLOTATION (DAF) FLOAT FROM THE PETROLEUM REFINING INDUSTRY.

. Waste code: K049
. Waste name: SLOP OIL EMULSION SOLIDS FROM THE PETROLEUM REFINING INDUSTRY.

. Waste code: K050
. Waste name: HEAT EXCHANGER BUNDLE CLEANING SLUDGE FROM THE PETROLEUM REFINING INDUSTRY.

. Waste code: K051
. Waste name: API SEPARATOR SLUDGE FROM THE PETROLEUM REFINING INDUSTRY.

. Waste code: K052
. Waste name: TANK BOTTOMS (LEADED) FROM THE PETROLEUM REFINING INDUSTRY.

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 24812

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 10573

Waste code: D008
Waste name: LEAD
Amount (Lbs): 702

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Amount (Lbs): 3569

Contact address: 4855 W ELECTRIC AVE
MILWAUKEE, WI 53219
Contact country: US
Contact telephone: 414-647-7874
Contact email: CHAD.PEPLINSKI@GE.COM
EPA Region: 05
Land type: Private
Classification: TSDF
Description: Handler is engaged in the treatment, storage or disposal of hazardous waste
Classification: Large Quantity Generator
Description: Handler: generates 1,000 kg or more of hazardous waste during any calendar month; or generates more than 1 kg of acutely hazardous waste during any calendar month; or generates more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month; or generates 1 kg or less of acutely hazardous waste during any calendar month, and accumulates more than 1 kg of acutely hazardous waste at any time; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulates more than 100 kg of that material at any time

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE

G E MEDICAL SYSTEMS ELECTRIC AVE FACILITY (Continued) **1000199988**

FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 24812

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 10573

Waste code: D008
Waste name: LEAD
Amount (Lbs): 702

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Amount (Lbs): 3569

Environmental Interest/Information System

WI-ESR (Wisconsin - Environmental System Registry) is a database that contains core information about facilities, organizations, and people related to Wisconsin's DNR (Department of Natural Resources).

TSCA SUBMITTER

AIR EMISSIONS CLASSIFICATION UNKNOWN

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS WASTE BIENNIAL REPORTER

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to

G E MEDICAL SYSTEMS ELECTRIC AVE FACILITY (Continued) **1000199988**

replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 07/19/2019

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

SHWS: Hazard Ranking List

State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

State and tribal Brownfields sites

BEAP: Brownfields Environmental Assessment Program

The Brownfields Environmental Assessment Program (BEAP) was a federal program that assisted municipalities with Environmental Site Assessments (ESA's) for tax delinquent or bankrupt properties, or properties a local government acquired for redevelopment. Using federal dollars, site assessments were conducted by Department of Natural Resources (DNR) staff to determine if the properties were contaminated.

Date of Government Version: 12/31/2000
Date Data Arrived at EDR: 05/29/2001
Date Made Active in Reports: 06/29/2001
Number of Days to Update: 31

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

AG SPILLS: Agricultural Spill Cases

Spills reported to the Department of Agriculture, Trade & Consumer Protection. There are two types of spills. Long-term: These are mainly pesticide and fertilizer cases. Some might include other contaminants at the same site. Some might involve wood-treaters - which use pesticides. All of them involve spills of products, but these spills generally result from day to day use (chronic spills) rather than accidental spills (acute). Accidental: These are the acute spills of pesticides and fertilizers and only involve pesticides and fertilizers. Most of these are cleaned up and closed within 3 to 6 months.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

BRRTS: Bureau of Remediation & Redevelopment Tracking System

BRRTS is a tracking system of contaminated sites. It holds key information for finding out more about a site or an activity. Activity types included are: Abandoned Container - An abandoned container with potentially hazardous contents recovered from a site. No discharge to the environment occurs. If the container did release a hazardous substance, a spill would be associated with the site. Superfund - is a federal program created by Congress in 1980 to finance cleanup of the nation's worst hazardous waste sites. VPLE - Voluntary Property Liability Exemptions apply to sites in which a property owner conducts an environmental investigation and cleanup of an entire property and then receives limits on their future liability. General Property - Environmental actions which apply to the property as a whole, rather than a specific source of contamination, such as the LUST or environmental repair site. Examples would be off-site letters, municipal liability clarification letters, lease letters, voluntary party liability exemption actions, and general liability clarification letters.

DRYCLEANERS: Five Star Recognition Program Sites

Drycleaning facilities enrolled in the Five Star Recognition Program. The primary focus of the Five Star program is to encourage reductions in the use and emissions of perchloroethylene (perc), a common but potentially hazardous drycleaning solvent. Participating cleaners pursue recycling opportunities, spill prevention strategies, more efficient solvent use, and more wet cleaning to reduce their perc consumption.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

COUNTY RECORDS

MILWAUKEE COUNTY:

BROWNFIELDS 2: List of Tax Delinquent Brownfields
Current owners of these sites have not paid their property taxes for one or more years. Based on at least an initial screening of these properties (including a historical land use check and a site visit), the City has decided not to foreclose because of potential environmental contamination. However, the City (using State Statute 75.106) may begin foreclosure, and then assign the foreclosure judgment to a new party that will remediate and redevelop the site. Testing may demonstrate that the site is clean or needs limited environmental clean-up.

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

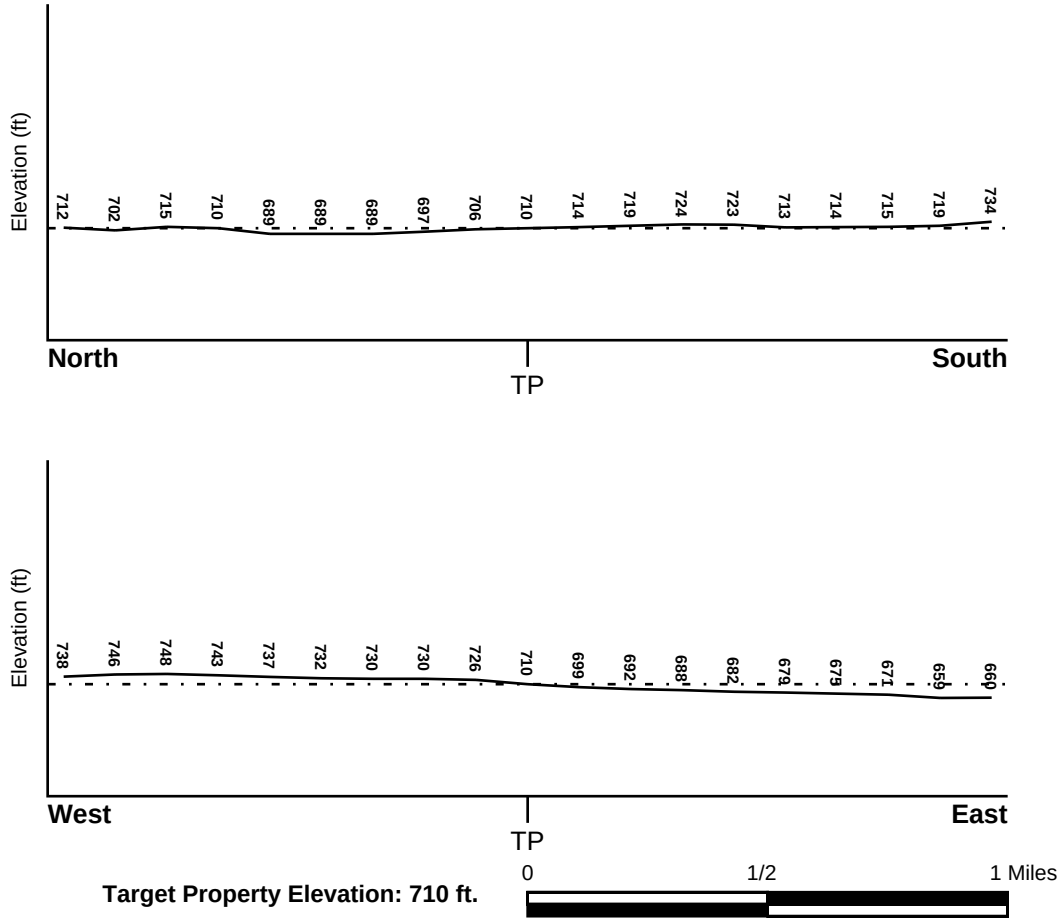
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
5502850002A	FEMA Q3 Flood data

Additional Panels in search area:	FEMA Source Type

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
MILWAUKEE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Unmapped area

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Wisconsin Well Construction Report File
Source: Department of Natural Resources
Telephone: 608-266-0153
In the past, not all latitude/longitudes were accurate. Many were protracted from centroid (center of the quarter sections given in PLSS). The ones that were not accurate were removed from the well database.

RADON

State Database: WI Radon
Source: Department of Health & Family Services
Telephone: 608-266-1865
Wisconsin Measurement Summary

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

GIS REGISTRY INFORMATION

MAY 12 2005

SITE NAME: Pressed Steel Tank

BRRTS #: 03-41-000421 **FID # (if appropriate):** 241037940

COMMERCE # (if appropriate):

CLOSURE DATE: July 17, 2003 MAY 13 2005

STREET ADDRESS: 1445 S. 66th Street

CITY: West Allis JUN 07 2005

SOURCE PROPERTY GPS COORDINATES (meters in WTM91 projection): X= 683396 Y= 284555

CONTAMINATED MEDIA: Groundwater [ ] Soil [ ] Both [X]

OFF-SOURCE GW CONTAMINATION >ES: [ ] Yes [X] No

IF YES, STREET ADDRESS 1:

GPS COORDINATES (meters in WTM91 projection): X= Y=

OFF-SOURCE SOIL CONTAMINATION >Generic or Site-Specific RCL (SSRCL): [ ] Yes [X] No

IF YES, STREET ADDRESS 1:

GPS COORDINATES (meters in WTM91 projection): X= Y=

CONTAMINATION IN RIGHT OF WAY: [ ] Yes [X] No

DOCUMENTS NEEDED:

Closure Letter, and any conditional closure letter issued	X
Copy of most recent deed, including legal description, for all affected properties	X
Certified survey map or relevant portion of the recorded plat map (*if referenced in the legal description*) for all affected properties	
County Parcel ID number, *if used for county*, for all affected properties	X
Location Map which outlines all properties within contaminated site boundaries on USGS topographic map or plat map in sufficient detail to permit the parcels to be located easily (8.5x14" if paper copy). If groundwater standards are exceeded, the map must also include the location of all municipal and potable wells within 1200' of the site.	X
Detailed Site Map(s) for all affected properties, showing buildings, roads, property boundaries, contaminant sources, utility lines, monitoring wells and potable wells. (8.5x14", if paper copy) This map shall also show the location of all contaminated public streets, highway and railroad rights-of-way in relation to the source property and in relation to the boundaries of groundwater contamination exceeding ch. NR 140 ESs and soil contamination exceeding ch. NR 720 generic or SSRCLs.	X
Tables of Latest Groundwater Analytical Results (no shading or cross-hatching)	X
Tables of Latest Soil Analytical Results (no shading or cross-hatching)	
Isoconcentration map(s), *if required for site investigation (SI)* (8.5x14" if paper copy). The isoconcentration map should have flow direction and extent of groundwater contamination defined. **If not available, include the latest extent of contaminant plume map.**	X
GW: Table of water level elevations, with sampling dates, and free product noted if present	X
GW: Latest groundwater flow direction/monitoring well location map (should be 2 maps if maximum variation in flow direction is greater than 20 degrees)	X
SOIL: Latest horizontal extent of contamination exceeding generic or SSRCLs, with one contour	
Geologic cross-sections, *if required for SI.* (8.5x14' if paper copy)	
RP certified statement that legal descriptions are complete and accurate	X
Copies of off-source notification letters (if applicable)	
Letter informing ROW owner of residual contamination (if applicable)(public, highway or railroad ROW)	
Copy of (soil or land use) deed restriction(s) or deed notice *if any required as a condition of closure*	X

Checklist of Documents for GIS Registry Packet

WI DNR, Bureau for Remediation and Redevelopment, PUB-RR-688

(Include with closure request – please assemble in this order. ***This checklist applies to closure requests for sites with groundwater exceeding ch. NR 140 standards and/or soil contamination exceeding ch. NR 720 generic or site specific residual contaminant levels (RCLs).)***

FID#: 241037940

BRRTS#: 03-41-000421

☒ **One-time fee of $250.00 for groundwater,** and/or
☒ **$200 for soil,** for each case closed, for maintenance of the registry.

☒ **Copies of the most recent deed** *including legal descriptions, for all properties within or partially within the contaminated site boundaries.* (Note: If a property has been purchased with a land contract and the purchaser has not yet received a deed, a copy of the land contract which includes the legal description shall be submitted instead of the most recent deed. If the property has been inherited, written documentation of the property transfer should be submitted along with the most recent deed.)

☐ **A copy of the certified surveyed map or the relevant section of the recorded plat map** *for those properties where the legal description in the most recent deed refers to a certified survey map or a recorded plat map.* (lots on subdivided or platted property (e.g. lot2 of xyz subdivision)) Not Applicable

☒ **Parcel identification number for each property,** *if the county in which the property is located uses parcel identification numbers.* West Allis Key Number 4540231000

☒ **Geographic position** of all properties within or partially within the contaminated site boundaries. *The coordinates need to be for a spot located at least 40 feet inside the property boundary. Refer to NR 716.15(2)(d)7, and (k). The coordinates must be in WTM91 projection. See the following WDNR website address for assistance:* www.dnr.state.wi.us/org/at/et/geo/gwur/index.htm .

683396, 284555 (See Attached Sheet)

☒ **A location map** which outlines all properties within the contaminated site boundaries on a U.S.G.S. topographic map or plat map in sufficient detail to permit the easy location of all parcels. If groundwater standards are exceeded, the map must also include the location of all municipal and potable wells within 1200 feet of the site. *(If only one parcel, combine with next item.)*

☒ **A map of all contaminated properties within site boundaries**, showing buildings, roads, property boundaries, contaminant sources, utility lines, monitoring wells and potable wells. This map shall also show the location of all contaminated public streets, and highway and railroad rights-of-way in relation to the source property and in relation to the boundaries of groundwater contamination exceeding ch. NR 140 enforcement standards, and/or in relation to the boundaries of soil contamination exceeding generic or site-specific residual contaminant levels as determined under s.. NR 720.09, 720.11 and 720.19.

☒ **A table of the most recent analytical results, with sample collection dates:** from all monitoring wells, and any potable wells for which samples have been collected **for groundwater**, and/or showing results for all contaminants found in pre-remedial sampling and in the most recent soil sampling event, **for soils** (without shading/crosshatching).

☒ **An isoconcentration map,** if required as part of the site investigation (SI), of the contaminated properties within the site boundaries. The map should include the areal extent of groundwater contamination exceeding PALs and ESs, groundwater flow directions based on the most recent data, and sample collection dates. **If an isoconcentration map was not required as part of the SI, substitute a map showing the horizontal extent of contamination,** based on the most recent data.

☒ **A table of the previous 4 water level elevation measurements from all monitoring wells,** at a minimum, with the date measurements were made, is to be included. If present, free product is to be noted on the table. In addition, **a groundwater flow direction map,** representative of groundwater movement at the site. If the flow direction varies by more than 20° over the history of the site, 2 groundwater flow maps showing the maximum variation in flow direction are to be submitted

☐ For sites closing with residual soil contamination, include **a map showing the location of all soil samples and a single contour** showing the horizontal extent of each area of continguous residual soil contamination that exceeds generic or site specific residual contaminant levels.

☐ **A geologic cross section,** if required as part of the SI, showing vertical extent and location of residual soil contamination exceeding generic or site specific RCLs and residual groundwater contamination, source extent and location; isoconcentrations for all groundwater contaminants that exceed PALs that remain when closure is requested; water table and piezometric elevations, and the location and elevation of geologic units, bedrock, and confining units, if any.

Not Applicable

☒ **A statement signed by the responsible party, which states that he or she believes that the legal descriptions attached to the statement are complete and accurate.** *(The point here is that the legal descriptions are describing the correct (i.e. contaminated) properties.)*

☐ **A copy of the letters sent by the RP to all owners of properties with groundwater exceeding ESs** (including the current source-property owner, if the RP is not the current source-property owner.) (*Off source properties are listed separately with a link to the source property.)* Not Applicable

☐ **A copy of all written notifications provided (to City/village/municipality/state agency or other responsible for maintenance) of a public street or highway or railroad right-of-way**, within or partially within the boundaries of the contaminated site, for contamination exceeding groundwater ESs and/or soil exceeding generic or site specific RCLs.

RE: Pressed Steel Tank Co., Inc. Facility Located at 1445 South 66th Street in Milwaukee, Wisconsin - STS Project No. 5-87255XA
WDNR FID # 241037940
WDNR BRRTS # 03-41-000421

Dear Mr. Amadi:

Enclosed please find completed soil and groundwater GIS Registry Packets for the referenced site, and required checks in the amounts of $200 and $250, respectively. Please note that the requested GIS Registries apply only to lots 20, 21 and 22 of Block 3 in C.A. Maynard and Agnew's Subdivision No. 3 in the NE1/4 of Section 3, T6N, R21E, in the City of West Allis, County of Milwaukee, State of Wisconsin as specified on the enclosed Warranty Deed, and as indicated on the enclosed maps that illustrate the horizontal extents of affected soil and groundwater.

We trust that the information contained herein adequately meets your current needs. If you have any questions, please do not hesitate to contact us.

Respectfully,

STS CONSULTANTS, LTD.

Mr. John Darling
Pressed Steel Company
1445 South 66th Street
West Allis, WI 53214

SUBJECT: Final Case Closure - Pressed Steel Tank, 1445 South 66th Street, West Allis, WI 53214; FID#: 241037940; BRRTS #: 03-41-000421.

Dear Mr. Darling:

In November, 1999, your site as described above was reviewed for closure by the Department of Natural Resources. The Department reviews environmental remediation cases for compliance with state laws and standards to maintain consistency in the closure of these cases. On November 12, 1999, you were notified that conditional closure was granted to this case.

The conditions of the closure required the responsible party (RP) to: a) place a soil and groundwater use restriction on the property; and b) abandon the monitoring wells (MW -1A, MW-1P, MW-1C, MW-2/RW-1, MW-3, MW-4, MW-5, MW-6 through MW-10). On March 26, 2003, the Department received correspondence indicating that the RP had opted to implement soil and groundwater GIS, in lieu of the soil and groundwater use restriction. However, the monitoring wells were not abandoned.and will be used for other on-going remedial cleanup activities (BRRTs#: 02-41-385114 & 06-41-272740) at the property. The monitoring wells will be abandoned when those cleanup activities are completed. Based on the correspondence and data provided, it appears that your site has been remediated to Department standards in accordance with s. NR 726.05, Wis. Adm. Code. The Department considers this case closed and no further investigation, remediation or other action is required at this time.

Your site will be listed on the DNR Remediation and Redevelopment GIS Registry of Closed Remediation Sites. Information that was submitted with your closure request application will be included on the registry. To review the sites on the GIS Registry web page, visit http://gomapout.dnr.state.wi.us/org/at/et/geo/gwur/index.htm

Please be aware that this case may be reopened pursuant to s. NR 726.09, Wis. Adm. Code, if additional information regarding site conditions indicates that contamination on or from the site poses a threat to public health, safety or welfare, or the environment.

The Department appreciates your efforts to restore the environment at this site. If you have any questions regarding this letter, please contact me at (414) 263-8639.

Sincerely,
Eric Amadi

West Allis, WI 53214

Subject: Case Closure for Pressed Steel Tank, 1445 S. 66th Street, West Allis, WI FID: 241037940, BRRTS: 03-41-000421.

Dear Mr. Garneau:

This letter is in response to the case closure request submitted by Graef, Anhalt, Schloemer, & Associates for the above-named site dated July 28, 1999. I presented this case to the Department's closure committee on 11/11/99. Based on the investigation and remedial documentation provided to the Department, the committee has decided to "conditionally close" this case with no further action at this time. The following items must be completed before final closure is granted and the case is officially tracked as such from the Department's tracking system:

1. A groundwater use restriction recorded at the County Register of Deeds office and a copy sent to this office [per s. NR 726.05(2)(b) and NR 726.05(8)(am)]. This is based on groundwater contamination above ch. NR 140 groundwater quality standards found in MW-1A, MW-1C, MW-2/RW-1 (04/13/99), and MW-5 (10/27/93).

2. A deed restriction recorded at the County Register of Deeds office and a copy sent to this office [per s. NR 726.05(2)(b) and NR 726.05(8)(b)]. This is based on contaminated soils left in-place after site remediation.

3. Abandonment of groundwater monitoring wells relevant to the former tank location as required in s. NR 726.05(8)(c) and forms sent to this office within 60 days.

Draft copies of the groundwater use and deed restriction should be sent to me for review. These will then be sent to our legal staff in Madison for final review. **Do not** file these documents until the Department's legal staff notifies you that their review process has been completed. After items No. 1 thru 3 above have been completed, the final closure letter will be sent to you.

The Department's Publication RR-606, *"Close Out Guidance on the Use of Deed and Groundwater Use Restrictions and Deed Notices"*, contains information about deed restrictions and document formats that should be used. This guidance can be obtained from the Department's web site at:

WARRANTY DEED

This indenture made this 13th day of December, A.D., 1966 between Pressed Steel Tank Company, a Corporation duly organized and existing under and by virtue of the laws of the State of Wisconsin, located at West Allis, Wisconsin, party of the first part, and Pressed Steel Tank Co., Inc., a Delaware corporation, located at West Allis, Wisconsin, party of the second part.

Witnesseth, that the said party of the first part, for and in consideration of the sum of One Dollar and other valuable consideration to it paid by the said party of the second part, the receipt whereof is hereby confessed and acknowledged, has given, granted, bargained, sold, remised, released, aliened, conveyed and confirmed, and by these presents does give, grant, bargain, sell, remise, alien, convey, and confirm unto the said party of the second part, its successors and assigns forever, the following described real estate, situated in the County of Milwaukee, State of Wisconsin, to-wit:

Parcel A

Lots 10-11-12-15-16-17-18-19-20-21-22-23-24-25-28-29-30-31-32-33-34-35 in Block 2, in C. A. Maynard and Agnew's Subdivision No. 3 in the NE 1/4 of Section 3, T6N, R21E, except that part of Lot 20 commencing at the SW corner thereof and running North along the West line of said lot 5 feet to a point, thence S 60° 22' E 4.94 feet to a point in the South line of said lot, thence S 59° 16' W along the South line of said lot 5 feet to the place of beginning, in the City of West Allis.

Parcel B

All of Block 3, in C. A. Maynard and Agnew's Subdivision No. 3 in the NE 1/4 of Section 3, T6N, R21E, in the City of West Allis.

Parcel C

Lots 1-2-3 in Block 9 in Central Improvement Company Subdivision No. 7 in the NE 1/4 of Section 3, T6N, R21E, in the City of West Allis.

Parcel D

Lot 5 in Block 1, in Assessor's Plat No. 269, being a part of the NE 1/4 of Section 3, T6N, R21E, in the City of West Allis.

Parcel E

* All of Block 3, in Assessor's Plat No. 294, being a part of the NE 1/4 of Section 11, T6N, R21E, in the Village of West Milwaukee, except that part which lay North of a line located 55 feet South of and parallel with the North line of the NE 1/4 of Section 11, T6N, R21E.

P35

Parcel F

Lot 7 in Block 11, in Assessor's Plat No. 296, being a part of the NE 1/4 of Section 11, T6N, R21E, in the Village of West Milwaukee, except that part which lay North of a line located 55 feet South of and parallel with the North line of the NE 1/4 Section 11, T6N, R21E.

Parcel G

That part of the NE 1/4 of Section 11, T6N, R21E, in the City of Milwaukee, bounded and described as follows: Commencing at a point on the East line which is 578.70 feet S 0° 18' W of the NE corner of said 1/4 Section; thence West on a line which is parallel to the North line of said 1/4 Section 213 feet to a point; thence S 0° 18' W on a line which is parallel to the East line of said 1/4 Section 50 feet to a point; thence East on a line parallel to the North line of said 1/4 Section 213 feet to a point in the East line of said 1/4 Section; thence N 0° 18' E along the East line of said 1/4 Section 50 feet to the place of beginning.

Together with all and singular the hereditaments and appurtenances thereunto belonging or in any wise appertaining; and all the estate, right, title, interest, claim or demand whatsoever, of the said party of the first part, either in law or equity, either in possession or expectancy of, in and to the above bargained premises, and their hereditaments and appurtenances.

To have and to hold the said premises as above described with the hereditaments and appurtenances, unto the said party of the second part, and to its successors and assigns FOREVER.

And the said Pressed Steel Tank Company party of the first part, for itself and its successors, does covenant, grant, bargain and agree to and with the said party of the second part, its successors and assigns, that at the time of the ensealing and delivery of these presents it is well seized of the premises above described, as of a good, sure, perfect, absolute and indefeasible estate of inheritance in the law, in fee simple, and that the same are free and clear from all incumbrances whatever, except (a) the effect of municipal zoning ordinances and the results of the exercise of governmental police powers, (b) general and special taxes for the year 1966 and all subsequent years, (c) rights with respect to the maintenance of public utility pipes, cables or conduits, not of public record, which may be installed under the surface of the parcels conveyed herein, (d) water easement from Village of West Milwaukee to City of Milwaukee, dated July 20, 1959, recorded October 23, 1959 as Document No. 3771229, (e) grant from Pressed Steel Tank Company to Wisconsin Electric Power Company, dated August 19, 1958, and recorded August 28, 1958, as Document No. 3680112, (f) water agreement between City of Milwaukee and The Firestone Tire & Rubber Company, dated April 10, 1944 and recorded April 26, 1944 as Document No. 2485352, (g) water agreement between City of Milwaukee and Pressed Steel Tank Company, dated April 17, 1942 and recorded May 4, 1942 as Document No. 2368597, (h) joint easement between Home Owner's Loan Corporation and Joseph Kaltenbrun and Myrtle Kaltenbrun, his wife, dated March 28, 1939, recorded April 21, 1939 as Document No. 2212510, (i) easement granted by Harriet D. Mitchell and Harriet D. Mitchell as trustee of the Estate of J. L. Mitchell to The Milwaukee Electric Railway & Light Company, dated August 19, 1920 and recorded September 28, 1920 as Document No. 1058363, (j) permit executed by the Town Board of the Town of Greenfield to City of Milwaukee, dated March 5, 1928, and recorded April 25, 1928, as Document No. 1605561, (k) such encroachments and easements disclosed by Survey

No. 117307-S (Parcel A), dated November 29, 1966, Survey No. 117308-S (Parcel C), dated November 28, 1966, Survey No. 117309-S (Parcels B and D), dated December 2, 1966, and Survey No. 117310-S (Parcels E, F and G), dated December 2, 1966, prepared by National Survey Service, and that the above bargained premises in the quiet and peaceable possession of the said party of the second part, its successors and assigns, against all and every person or persons lawfully claiming the whole or any part thereof, it will forever WARRANT and DEFEND.

In Witness Whereof, the said Pressed Steel Tank Company, party of the first part, has caused these presents to be signed by N. A. Evans, its President, and countersigned by E. L. Griffin, its Secretary, at Milwaukee, Wisconsin, and its corporate seal to be hereunto affixed, this 13th day of December, A. D. 1966.

December 2003

City of West Allis - Six Points / Farmers Market "700 Series" Sites

Attachment 1 - Part D., 6., (Page 2 of 3) Detailed Project Description

The Six Points / Farmers Market Redevelopment Project is the most extensive urban renewal project ever undertaken by the City of West Allis. The project involves acquisition of 40+ properties by the City in a 60 acre area, with pre-development costs estimated in excess of $13 million and relocation of occupants in accordance with Wisconsin Relocation Law.

The "700 Series" properties comprise one of the largest contiguous tracts of property within the Six Points / Farmers Market Redevelopment Project. Current property uses are primarily industrial, including steel finishing and fabricating, door manufacturing, industrial equipment warehousing, and scrapyard/salvage operations. Historical uses also include fuel storage and supply, a ready mix concrete plant, concrete product manufacturing, and a metals foundry and smeltering shop. Several small tavern/apartment properties are located currently and historically in the northeast corner of the tract.

Redevelopment of the "700 Series" properties (all parcels have been acquired by the City) will involve decommissioning of the industrial buildings and operations on the tract, including assessment and abatement of ACBM. Following decommissioning, existing buildings will be demolished, including foundations and paving where necessary. Infrastructure improvements and site regrading will be completed in preparation for site redevelopment.

Phase I Environmental Site Assessments (ESAs) have been completed at all the sites. A comprehensive Phase II ESA of the 705 property has been completed and Phase II ESAs for the 701-708-709 and 704 properties have been completed. Asbestos Assessments have been completed for all of the 700 properties. Completion of an NR 716 Site Investigation and Remedial Action Planning will be designed and performed for the 700 Series tract as appropriate based on the Phase II ESA results.

After environmental work and site preparation activities are completed, the City of West Allis currently plans to provide properties 701, 708 and 709 to Pressed Steel Tank for employee parking, since the overall Six Points / Farmers Market Plan calls for redevelopment of the current PST parking areas in the "100 Series" tract. The large remaining area of the "700 Series" tract, approximately 5 acres, will be redeveloped according to a mixed use plan involving a variety of commercial and residential uses.

WEST ALLIS WI 53214

SUBJECT: Land Recycling Loan Program Notice of Intent to Apply
Project No. 5073-02
Pressed Steel Site Remediation

Dear Mr. Stibal:

We received your Land Recycling Loan Program (LRLP) Notice of Intent to Apply (ITA) form. Even though your municipality will appear on the LRLP SFY 2005 Project Priority List, placement on the list does not guarantee the eligibility of, or funding for, this project. Eligibility for funding is determined after a complete review of your LRLP Financial Assistance Application.

Please be aware that applicants must comply with requirements regarding procurement of minority- and women-business enterprises and small businesses in rural areas (MBE/WBE/SBRAs). When your municipality awards prime contracts, or your prime contractor or a subcontractor awards subcontracts for an LRLP project, you must make a good faith effort to procure the services of MBEs and WBEs. This applies when you contract for construction work, equipment, raw materials, and supplies. In an effort to assist your municipality in complying with this requirement, DNR developed a Good Faith Certification form (Form 8700-294, available at http://www.dnr.state.wi.us/org/caer/cfa/EL/forms.html). It is mandatory that you complete this form and submit it to the DNR prior to receiving a financial assistance agreement.

If you want information regarding the LRLP and the application process, contact your project manager, Maureen Hubeler, at (608) 266-0849 or hubelm@dnr.state.wi.us. Detailed information and guidance are also available in the Environmental Loans Section's web pages at http://www.dnr.state.wi.us/org/caer/cfa/el/elindex.html.

Sincerely,

Ken Hollenzer

Applicant Certification

1. **The applicant declares that the following procurement requirement will be satisfied:**
Procurement of professional services and remediation contracts by recipients under the Land Recycling Loan Program shall be in accordance with federal, state and local law and shall be subject to review of eligibility, allocability, allowability and reasonableness. As established in ch. NR 167, Wis. Adm. Code, and Federal Regulations 40 CFR 31.36(e) and 35.6580(a), each recipient of financial assistance and those employed by the recipient to plan, design or remediate the project shall make good faith efforts or take affirmative steps to utilize minority and women business enterprises in contracts for services, equipment, raw materials and supplies. In addition, recipients of federal funds shall take affirmative steps to also utilize small businesses in rural areas. Please refer to ch. NR 167, Wis. Adm. Code, and the Environmental Improvement Fund Reference Guide for further details on these guidelines.

2. I hereby certify that: a) all information provided on this form is extracted and accumulated from records of the applicant; and b) I took all reasonable precautions necessary to ensure that such information is accurate and in all respects is fair in what it purports to represent.

Attachment #1

City of West Allis – 101 Block

This project is part of the City of West Allis' Six Points Farmers Market Redevelopment Project (TIF #5). The scope of this particular phase includes the acquisition, via eminent domain, of a 7.7-acre manufacturing site owned and operated by Pressed Steel Tank Co., Inc. The area has attracted a developer proposing to develop a quality, mixed-use development. Site preparation requires a significant amount of environmental remediation and above average demolition/decommissioning costs.

WEST ALLIS WI 53214

SUBJECT: Land Recycling Loan Program Notice of Intent to Apply
Project No. 5073-04
Six Point's Farmer's Market Redevelopment - 100 & 300 Series

Dear Mr. Stibal:

We received your Land Recycling Loan Program (LRLP) Notice of Intent to Apply (ITA) form. Even though your municipality will appear on the LRLP SFY 2005 Project Priority List, placement on the list does not guarantee the eligibility of, or funding for, this project. Eligibility for funding is determined after a complete review of your LRLP Financial Assistance Application.

Please be aware that applicants must comply with requirements regarding procurement of minority- and women-business enterprises and small businesses in rural areas (MBE/WBE/SBRAs). When your municipality awards prime contracts, or your prime contractor or a subcontractor awards subcontracts for an LRLP project, you must make a good faith effort to procure the services of MBEs and WBEs. This applies when you contract for construction work, equipment, raw materials, and supplies. In an effort to assist your municipality in complying with this requirement, DNR developed a Good Faith Certification form (Form 8700-294, available at http://www.dnr.state.wi.us/org/caer/cfa/EL/forms.html). It is mandatory that you complete this form and submit it to the DNR prior to receiving a financial assistance agreement.

If you want information regarding the LRLP and the application process, contact your project manager, Linda Miller, at (608) 267-0801 or millel@dnr.state.wi.us. Detailed information and guidance are also available in the Environmental Loans Section's web pages at http://www.dnr.state.wi.us/org/caer/cfa/el/elindex.html.

Sincerely,

Ken Hollenzer

December 2003

City of West Allis - Six Points / Farmers Market "100 & 200 Series" Sites

Attachment 1 - Part D., 6., (Page 2 of 3) Detailed Project Description

The Six Points / Farmers Market Redevelopment Project is the most extensive urban renewal project ever undertaken by the City of West Allis. The project involves acquisition of 40+ properties by the City in a 60 acre area, with pre-development costs estimated in excess of $13 million and relocation of occupants in accordance with Wisconsin Relocation Law.

The "100 Series" properties (the block on the east side of South 66th Street, not including the Pressed Steel Tank manufacturing plant (101)) comprise a large block of mostly small properties. Generally, current use of individual sites is representative of historical use as well. The row of sites along the south side of West Greenfield Avenue (107 through 112), as well as properties 103, 104, and 106, have historically been occupied by two- or three-story wood framed buildings, typically housing a tavern or restaurant on the ground floor, and rooms for rent or apartments in upper stories. Most of these buildings contain several forms of ACBM, and several sites have reportedly had fuel oil USTs. The southeast corner of the 100 series block is occupied by two individual residences (114 and 115).

The balance of the 100 block is comprised of parking area currently owned and used by PST (105 and 113), the PST automotive garage and maintenance building (102) and the PST industrial equipment storage building (building on 113). The automotive garage was historically serviced by an on-site 1,000-gallon gasoline UST, which has been removed and closed. Any investigation and remediation costs associated with residual contamination sourced from this UST or vehicle filling operations at the automotive garage should be eligible for reimbursement from the PECFA program.

Phase I ESAs have been completed on all 100 series properties with the exception of 104 as it is a vacant lot. A limited Phase II ESA and limited NR 716 Site Investigation of this area also has been completed. To date, widely distributed and generally low level soil and groundwater contamination (DRO, VOC, PAH, metals) has been identified in this area. Minor DRO and PVOC contamination was identified in a Phase II ESA conducted on property 112 in response to a reported fuel oil UST. Remaining environmental tasks include completion of a Phase II ESA and NR 716 Site Investigation and Remedial Action Planning activities. These will focus primarily on the areas adjacent to the industrial buildings (102 and 113) and completing soil and groundwater sampling and analysis at additional locations on sites 102, 105 and 113.

The City of West Allis has acquired all the properties. Redevelopment of the 100 series properties will involve decommissioning of on-site structures, estimated to consist primarily of asbestos assessment and abatement. The buildings will subsequently be demolished, including removal of foundations and existing paving. Infrastructure improvements and site regrading will be completed

to facilitate redevelopment of the block. The City of West Allis currently plans construction of a multi-family apartment building with retail on the first floor on the 100 series block, in response to the heavy demand for affordable housing in the West Allis area.

The "200 Series" properties (Property Nos. 201 through 208 and 222 through 226) comprise a large block of mostly small properties. Generally, current use of individual sites is representative of historical use as well. Properties 203, 204, and 208 have historically been occupied by two- or three-story wood framed buildings, typically housing a tavern or restaurant on the ground floor, and rooms for rent or apartments in upper stories. Properties 205, 207, and 222 through 224 have historically been residential properties. Site 206, 225 and 226 are currently City owned vacant lots. Most of these buildings contain several forms of ACBM, and sites 201 and 202 were formerly occupied by a service station, where residual hydrocarbon soil and groundwater contamination remain.

Phase I ESAs have been completed on all 200 series properties. Copies of asbestos assessments are also included for the properties where potential ACBM was noted in the Phase I ESAs. All 200 series properties are currently owned by the City. Redevelopment of the 200 series properties will involve decommissioning of on-site structures, estimated to consist primarily of asbestos assessment, where not completed as of this date, and abatement. The buildings will subsequently be demolished, including removal of the foundations and existing paving. Infrastructure improvements and site regrading will be completed to facilitate redevelopment of the block.

The redevelopment of the 200 properties is integral to the Six Points/Farmers Market redevelopment project. Currently, the property block is being redeveloped as a multi-story building extending along the south side of Greenfield Avenue. The construction will include a senior citizen residential complex, including retail, commercial and potentially a restaurant on the street level with condominiums/apartments in the upper stories.

SUBJECT: Land Recycling Loan Program Notice of Intent to Apply
Project No. 5073-05
Remediation Of 1960 South 67th Place

Dear Mr. Stibal:

We received your Land Recycling Loan Program (LRLP) Notice of Intent to Apply (ITA) form. Even though your municipality will appear on the LRLP SFY 2005 Project Priority List, placement on the list does not guarantee the eligibility of, or funding for, this project. Eligibility for funding is determined after a complete review of your LRLP Financial Assistance Application.

Please be aware that applicants must comply with requirements regarding procurement of minority- and women-business enterprises and small businesses in rural areas (MBE/WBE/SBRAs). When your municipality awards prime contracts, or your prime contractor or a subcontractor awards subcontracts for an LRLP project, you must make a good faith effort to procure the services of MBEs and WBEs. This applies when you contract for construction work, equipment, raw materials, and supplies. In an effort to assist your municipality in complying with this requirement, DNR developed a Good Faith Certification form (Form 8700-294, available at http://www.dnr.state.wi.us/org/caer/cfa/EL/forms.html). It is mandatory that you complete this form and submit it to the DNR prior to receiving a financial assistance agreement.

If you want information regarding the LRLP and the application process, contact your project manager, Maureen Hubeler, at (608) 266-0849 or hubelm@dnr.state.wi.us. Detailed information and guidance are also available in the Environmental Loans Section's web pages at http://www.dnr.state.wi.us/org/caer/cfa/el/elindex.html.

Notice of Intent to Apply

December 2003

City of West Allis - 1960 67th Place (Lime Pit)

Attachment 1 - Part D., 6., (Page 2 of 3) Detailed Project Description

The proposed project area is located at 1960 South 67th Place which is an 11.61-acre parcel located on the site of a former Industrial landfill. The site is bounded by the Union Pacific railroad tracks on the north, Becher Place on the east, the West Allis Fire Station #2 on the south, and St. Augustine Catholic School on the west. The site is currently zoned as an M-1 Manufacturing District.

The site is surrounded on the west, south and east by a predominately residential neighborhood. The site is immediately abutted; on the west by St. Augustine(s Church and School, on the south by Fire Station No. 2 and across the street to the west by single-family homes and the City(s Public Work(s Department. Heavy manufacturing is located across the railroad tracks to the north.

Air Reduction Company (AIRCO Industrial and AIRCO Welding Products) occupied the site between 1932 and 1984. They manufactured carbide gas, which produced the byproduct (lime slurry). The lime slurry was disposed in pits on the site. The current owner acquired the site approximately and over the past 18-19 years portions of the site have been rented out to various businesses. The property has been used as lime slurry pit, a waste storage and transfer facility, an oil/hazardous waste trucking terminal, and a salvage/junkyard.

The property, formerly occupied by a carbide gas manufacturer, can be characterized as an older manufacturing site with dilapidated industrial structures, warehouses, and garages. The property contains four deteriorating & dilapidated metal and brick industrial/storage buildings varying in size between approximately 3,600 to 5,500 square feet. The site also has two large deteriorating storage silos standing near the former lime pit.

According to the Wisconsin Department of Natural Resources public access file, the records from the West Allis Building Inspections files and observations of current operations there are three major causes of blight in the project area 1.) The presence of environmentally hazardous conditions, 2.) The presence of deteriorated and dilapidated structures and 3.) Increasing geotechnical degradation of the site.

The City of West Allis was awarded the WDNR Brownfields Site Assessment Grant to provide funding for a Phase II Environmental Site Assessment, potential container removal, a portion of an NR 716 Site Investigation and potentially structure demolition. The City of West Allis is currently seeking to redevelop the 11.61-acre parcel on the east side of the City into quality lot for the creation of a Business park.

Mr. John Darling
Pressed Steel Company
1445 South 66th Street
West Allis, WI 53214

SUBJECT: Final Case Closure - Pressed Steel Tank, 1445 South 66th Street, West Allis, WI 53214; FID#: 241037940; BRRTS #: 03-41-000421.

Dear Mr. Darling:

In November, 1999, your site as described above was reviewed for closure by the Department of Natural Resources. The Department reviews environmental remediation cases for compliance with state laws and standards to maintain consistency in the closure of these cases. On November 12, 1999, you were notified that conditional closure was granted to this case.

The conditions of the closure required the responsible party (RP) to: a) place a soil and groundwater use restriction on the property; and b) abandon the monitoring wells (MW -1A, MW-1P, MW-1C, MW-2/RW-1, MW-3, MW-4, MW-5, MW-6 through MW-10). On March 26, 2003, the Department received correspondence indicating that the RP had opted to implement soil and groundwater GIS, in lieu of the soil and groundwater use restriction. However, the monitoring wells were not abandoned.and will be used for other on-going remedial cleanup activities (BRRTs#: 02-41-385114 & 06-41-272740) at the property. The monitoring wells will be abandoned when those cleanup activities are completed. Based on the correspondence and data provided, it appears that your site has been remediated to Department standards in accordance with s. NR 726.05, Wis. Adm. Code. The Department considers this case closed and no further investigation, remediation or other action is required at this time.

Your site will be listed on the DNR Remediation and Redevelopment GIS Registry of Closed Remediation Sites. Information that was submitted with your closure request application will be included on the registry. To review the sites on the GIS Registry web page, visit http://gomapout.dnr.state.wi.us/org/at/et/geo/gwur/index.htm

Please be aware that this case may be reopened pursuant to s. NR 726.09, Wis. Adm. Code, if additional information regarding site conditions indicates that contamination on or from the site poses a threat to public health, safety or welfare, or the environment.

The Department appreciates your efforts to restore the environment at this site. If you have any questions regarding this letter, please contact me at (414) 263-8639.

Sincerely,
Eric Amadi

Pressed Steel Tank
1445 S 66th St
Milwaukee, WI 53214

SUBJECT: Pending Site Closure:

Pressed Steel Co; BRRTS ID # 0341000421
1445 S 66th St; West Allis, Wisconsin

Dear Responsible Party:

According to our records the Department of Natural Resources (DNR) granted a conditional closure pending the recording of a Groundwater Use Restriction for the above referenced case on November 12, 1999. Since that time, this agency has not received proof that this restriction has been recorded. In light of administrative rule revisions that became effective November 1, 2001, you now have two options for fulfilling this obligation and obtaining final closure. One option is to record a Groundwater Use Restriction at the County Register of Deeds office for your property and for any impacted neighboring properties, if applicable. The other option now available is to have the property placed on the Geographic Information Systems Registry of Closed Remediation Sites (GIS Registry) with the State.

By utilizing the option of placing the information on the GIS Registry, you will not be required to record a Groundwater Use Restriction at the Register of Deeds office. To place the property on the GIS Registry, you will need to accomplish the steps on the attached list.

Please note that, whichever option you choose, you are still required to comply with any other conditions of closure (monitoring well abandonment forms, soil disposal documents, etc.) outlined in the conditional closure approval letter (enclosed) that was sent to you.

Within 30 days of receipt of this notice, please inform this agency which option you intend to pursue. Please be advised that your failure to respond to this letter will be viewed as an admission that you do not intend to pursue final closure of your site. In that situation, we will recommend further enforcement actions be initiated. Enforcement actions could include the recording of an affidavit at the County Register of Deeds office indicating contamination remains, while at the same time issuing an administrative order or making a direct referral to the State Attorney General's Office to recoup our costs and any associated fees that may have been due. Any referral to the State Attorney General's Office could result in forfeitures.

The Department appreciates your efforts to restore the environment at this site and encourages you to take the final steps necessary to get case closure. If you have any questions about this letter, please contact your project manager, Eric Amadi, at (414) 263-8639.

Sincerely,

Victoria Stovall

Subject: Case Closure for Pressed Steel Tank, 1445 S. 66th Street, West Allis, WI FID: 241037940, BRRTS: 03-41-000421.

Dear Mr. Garneau:

This letter is in response to the case closure request submitted by Graef, Anhalt, Schloemer, & Associates for the above-named site dated July 28, 1999. I presented this case to the Department's closure committee on 11/11/99. Based on the investigation and remedial documentation provided to the Department, the committee has decided to "conditionally close" this case with no further action at this time. The following items must be completed before final closure is granted and the case is officially tracked as such from the Department's tracking system:

1. A groundwater use restriction recorded at the County Register of Deeds office and a copy sent to this office [per s. NR 726.05(2)(b) and NR 726.05(8)(am)]. This is based on groundwater contamination above ch. NR 140 groundwater quality standards found in MW-1A, MW-1C, MW-2/RW-1 (04/13/99), and MW-5 (10/27/93).

2. A deed restriction recorded at the County Register of Deeds office and a copy sent to this office [per s. NR 726.05(2)(b) and NR 726.05(8)(b)]. This is based on contaminated soils left in-place after site remediation.

3. Abandonment of groundwater monitoring wells relevant to the former tank location as required in s. NR 726.05(8)(c) and forms sent to this office within 60 days.

Draft copies of the groundwater use and deed restriction should be sent to me for review. These will then be sent to our legal staff in Madison for final review. **Do not** file these documents until the Department's legal staff notifies you that their review process has been completed. After items No. 1 thru 3 above have been completed, the final closure letter will be sent to you.

The Department's Publication RR-606, *"Close Out Guidance on the Use of Deed and Groundwater Use Restrictions and Deed Notices"*, contains information about deed restrictions and document formats that should be used. This guidance can be obtained from the Department's web site at:

www.dnr.state.wi.us/org/aw/rr/general

The Department appreciates the actions you have taken to investigate and remediate the contamination at this site. If you have any questions or comments, please feel free to contact me at the above address or at (414) 263-8644. Please refer to the FID number at the top of this letter in any future correspondence. Please send all documentation to me in order to expedite what's required in this letter.

Sincerely,

John J. Hnat

Subject: Case Closure for Pressed Steel Tank, 1445 S. 66th Street, West Allis, WI FID: 241037940, BRRTS: 03-41-000421.

Dear Mr. Garneau:

This letter is in response to the case closure request submitted by Graef, Anhalt, Schloemer, & Associates for the above-named site dated July 28, 1999. I presented this case to the Department's closure committee on 11/11/99. Based on the investigation and remedial documentation provided to the Department, the committee has decided to "conditionally close" this case with no further action at this time. The following items must be completed before final closure is granted and the case is officially tracked as such from the Department's tracking system:

1. A groundwater use restriction recorded at the County Register of Deeds office and a copy sent to this office [per s. NR 726.05(2)(b) and NR 726.05(8)(am)]. This is based on groundwater contamination above ch. NR 140 groundwater quality standards found in MW-1A, MW-1C, MW-2/RW-1 (04/13/99), and MW-5 (10/27/93).

2. A deed restriction recorded at the County Register of Deeds office and a copy sent to this office [per s. NR 726.05(2)(b) and NR 726.05(8)(b)]. This is based on contaminated soils left in-place after site remediation.

3. Abandonment of groundwater monitoring wells relevant to the former tank location as required in s. NR 726.05(8)(c) and forms sent to this office within 60 days.

Draft copies of the groundwater use and deed restriction should be sent to me for review. These will then be sent to our legal staff in Madison for final review. **Do not** file these documents until the Department's legal staff notifies you that their review process has been completed. After items No. 1 thru 3 above have been completed, the final closure letter will be sent to you.

The Department's Publication RR-606, *"Close Out Guidance on the Use of Deed and Groundwater Use Restrictions and Deed Notices"*, contains information about deed restrictions and document formats that should be used. This guidance can be obtained from the Department's web site at:

www.dnr.state.wi.us/org/aw/rr/general

The Department appreciates the actions you have taken to investigate and remediate the contamination at this site. If you have any questions or comments, please feel free to contact me at the above address or at (414) 263-8644. Please refer to the FID number at the top of this letter in any future correspondence. Please send all documentation to me in order to expedite what's required in this letter.

Sincerely,

John J. Hnat

RE: Case Closure Request Submitted by Pressed Steel Tank Located at 1445 South 66th Street, West Allis, Wisconsin
WI FID #: 241037941
BRRTS #: 03-41-000421

Dear Mr. Hnat:

The purpose of this letter is to confirm our recent telephone conversation regarding the above-referenced matter. As you know, I had contacted you to discuss your correspondence of October 13, 1999 regarding Pressed Steel Tank's case closure request. Based upon our discussion, it is my understanding that you have now been able to locate additional file materials relating to this matter and you will reconsider Pressed Steel Tank's case closure request in light of these additional materials. As such, it is my understanding that it will not be necessary for us to submit any additional information until we here from you. We look forward to receiving the results of your reconsideration of our case closure request. Thank you in advance for your time and attention to this matter.

Very truly yours,

GODFREY & KAHN, S.C.

Subject: Case Closure Request, Pressed Steel Tank, 1445 S. 66th Street, West Allis, WI FID: 241037940
BRRTS: 03-41-000421.

Dear Mr. Garneau:

This letter is in response to the case closure request submittal by Graef, Anhalt, Schloemer, & Associates for the above-named site dated July 30, 1999. Based upon review of the submittal and file documents pertaining to this case, the Department denies case closure at this time. This letter indicates what conditions must be met in order for the case to receive further consideration by the Department for closure as discussed below. The department may impose additional site investigation requirements beyond those specifically described:

1. The submittal did not include a site investigation report required under ch. NR 716, Wis. Admin. Code.

2. The submittal did not include documentation required in ch. NR 726, Wis. Admin. Code.

3. The type of closure requested for groundwater was natural attenuation under ch. NR 726.05(2)(b), Wis. Admin. Code. Under this chapter, there must be supporting documentation for this remediation. Groundwater quality analysis for the site has not been completed. The minimum results per ch. NR 726.05(3)(a)(3), are 4 successive quarterly rounds of sampling demonstrating compliance with the applicable requirements of ch. NR 140. Also, analysis of the presence of sufficient electron acceptors will aid in demonstrating that degradation processes are occurring as required per ch. NR 722.07(4)(a)4(h). The Department suggests reviewing the interim guidance for natural attenuation (PUBL RR-530-97) for further requirements.

If you have additional, relevant information which was not formerly provided to the Department, and which you feel would significantly impact the Department's closure decision, you may submit that information for our re-evaluation of case closure. The Department appreciates the actions you have taken to investigate and remediate the contamination at this site. If you have any questions or comments, please feel free to contact me at the above address or at (414) 263-8644. Please refer to the FID number at the top of this letter in any future correspondence. Future correspondence should be sent directly to the Remediation and Redevelopment programs assistant Brenda Brown (263-8680) at the above address.

Sincerely,

John J. Hnat

Estimated volume of insitu soils exceeding NR 720 RCLs: 295 cy (assuming 3.75 ft thick)

Tables for Post Remedial Analytical Results Attached? NA Yes No Maps of Post Remedial Sample Locations Attached? NA Yes No

Brief Description of Remedial Action Taken:

Contaminated soils adjacent to the UST were removed to the extent practical at the time of the UST removal. The majority of the contamination appears to have followed a sewer lateral (located along the UST) north from the tank. This area is below a paved yard (~6 to 10 in. concrete) adjacent to two PST buildings. The water table in this area ranges from approximately 5 ft. to 1 ft below grade. For the most part, soil contamination is at or below the water table and as such does not represent a risk for leaching through infiltration. Rather a direct partitioning between the sediments and water. Access to the contaminated material via direct contact is limited by the existing structures and pavement. It is proposed that the existing structures and pavement be considered an engineering control to minimize the direct contact exposure. The pavement will also minimize infiltration through the limited thickness of unsaturated materials thus limiting future impacts.

A groundwater recovery trench was excavated through contaminated saturated soils in the paved area referred to above. These soils were disposed of at Metro landfill.

4. GROUNDWATER ANALYTICAL RESULTS

Potential Receptors for Groundwater Migration Pathway: There are no surface water bodies or supply wells in the area of the site.

Brief Description of Remedial Action Taken:

The remedial system was designed to address groundwater contamination associated with two commingled groundwater contaminant plumes; one resulting from the 1,000-gallon underground gasoline storage tank and the other resulting from chlorinated solvents of uncertain origin. The system consisted of a tee-shaped recovery trench with a recovery sump (RW-1) at the cross of the tee. There was a second recovery well located outside of the trench, several feet from the base of the tee (MW-1). This well was deeper than the recovery trench to recover a deeper zone of contaminated groundwater. Water pumped from the two wells was piped to the remediation building and was processed through a shallow tray air stripper. The treated water was then discharged to a storm sewer.

Influent and effluent samples were collected on a monthly basis since the onset of pumping (with the exception of September 1997). Samples of the recovered water were collected from the discharge lines of both pumps. Total detected VOCs appeared to be a downward trend at the recovery well. At the trench recovery well there were definite downward trends in the data, often decreasing by greater than an order of magnitude. The system was operated until the petroleum compounds in the influent were no longer were in exceedance of ESs. The system was shut down in May 1998. Groundwater contaminant levels were assessed in October 1998 and again in April 1999. Contaminant levels rebounded somewhat in comparison to levels measured during active remediation.

WISCONSIN DEPARTMENT OF NATURAL RESOURCES Form ____ - ____
Case Summary and Close Out Form Instructions Rev. 1/98

The Case Summary and Close Out Form and attached instructions have been designed by staff in the Bureau for Remediation and Redevelopment to provide responsible parties, environmental consultants, Department staff, and other interested parties with a checklist of information that must be evaluated prior to case closure. The closure of a case means that the Department has determined that no further response is required at that time. Various closure options are available within Department codes. Responsible parties and their consultants should specify the options sought for closure for the soils and groundwater at their site. Groundwater quality standards found in NR 140 and soil standards found in NR 720 must generally be met. However, some closure options allow closure where groundwater or soil standards are not met provided that deed or groundwater use restrictions are imposed on the subject property. A previously closed case may be reopened by the Department if information regarding site conditions indicates that contamination on or from the site poses a threat to public health, safety or welfare or the environment.

In order to expedite the closure process for your case, you should submit a complete and accurate submittal according to the following instructions. Submit the Case Summary and Close Out Form and required attachments as a stand alone document and **please do not** submit the close out request in a bound report. The information supplied should succinctly summarize the chronological history of the entire case and should reinforce the justification for closure. Submission of tabulated analytical results from previous reports are acceptable (i.e. it is not necessary to create new tables). However, do not submit previously submitted reports themselves as attachments. **Submittals with incomplete forms and/or documentation will be returned.** The following should be included in the order shown:

X **(A) Case Summary and Close Out Form** must be complete. A brief, **written** case history, justification for case closure and description of the remedial action taken must be included. The type of closure requested for both the soil and groundwater must be indicated.

X **(B) Site Map**, per NR 716.15(2)(d)5-6, to scale showing the layout of the buildings, roads, tank and/or discharge locations, utilities, receptors, monitoring and potable wells, property lines and other relevant features of the site. If possible, the scale should be 1 inch = 10 or 20 feet.

X **(C) Pre-Remedial Soil Analytical Results Table(s)** which show the analytical results and sample depths of all of the pre-remedial soil samples (i.e. tank pull, site investigation, etc.). If more than one table, please put them in chronological order. Highlight those results which exceed the NR 720 soil standards. Provide the level of detection for results which are below the detection level (i.e. don't just list as ND). Identify the depth of the water table. All data must be in table format as identified in NR 716.15(2)(g)3 and 716.15(2)(h)3, (i.e. do not submit lab data sheets)

X **(D) Pre-Remedial Soil Sample Location Map(s)** which show the locations of the items from B, above, and the soil sample locations from C, above. Highlight those sample locations which exceed NR 720. Maps should be prepared according to the applicable portions of NR 716.15(2)(h)1. You may submit more than one map.

None **(E) Pre-Remedial Geologic Cross Section(s)** including source location(s), extent of soil and groundwater contamination, soil sample locations, water table elevation, and bedrock elevation, if encountered. Maps should be prepared according to NR 716.15(2)(g)5-8 and NR 716.15(2)(h)1-2.

None **(F) Post-Remedial Soil Analytical Results Table(s)** which show the analytical results and sample depths of all of the post-remedial soil samples. Highlight the analyses which exceed NR 720 soil standards. Provide the level of detection for analytical results which are below the detection level (i.e. don't just list as ND). Identify the depth of the water table. All data must be in table format as identified in NR 716.15(2)(g)3 and 716.15(2)(h)3, (i.e. do not submit lab data sheets).

NA **(G) Post-Remedial Soil Sample Location Map(s)** which show the locations of items from B, above, and the soil sample locations from F, above. Highlight those sample locations which exceed NR 720. Maps should be prepared according to the applicable portions of NR 716.15(2)(h)1. You may submit more than one map.

NA **(H) Post-Remedial Geologic Cross Section(s)** including former source location(s), remaining soil contamination, soil sample locations, extent of excavation, water table elevation, and bedrock elevation, if encountered. Maps should be prepared according to NR 716.15(2)(g)5-8 and NR 716.15(2)(h)1-2.

X **(I) Groundwater Analytical Results Table(s)** showing all of the site's historical groundwater analytical results in chronological order. Highlight those results which exceeded NR 140 (differentiate between PAL and ES exceedances). All data must be in table format as identified in NR 716.15(2)(g)3 and 716.15(2)(h)3, (i.e. do not submit lab data sheets). Differentiate between pre-remedial, remedial and post-remedial samples (i.e. identify when the groundwater remediation system was active/inactive).

X **(J) Groundwater Sample Location Map(s)** which show the locations of the items from B, above, and all of the monitoring wells/sumps/extraction wells/potable wells. Highlight those wells which have PAL or ES exceedances (in the most recent round of sampling, differentiate between PAL and ES). Maps should be prepared according to the applicable portions of NR 716.15(2)(h)1. You may submit more than one map.

X **(K) Groundwater Contour Map(s)** which show the historical changes in direction, elevation and/or gradient. Provide one map if data is consistent. Maps should be prepared according to the applicable portions of NR 716.15(2)(g)5-8 and NR 716.15(2)(h)1-2.

INSTRUCTIONS

Purpose of Form 4-B: This form is to document that the Department of Natural Resources approved of the activities provided within this claim for reimbursement by PECFA.

1. For A enter the eleven digit PECFA claim number. Please use this number when you correspond with the department regarding this claim
2. For B enter the claimant's name
3. For C enter the claimant's personal street address
4. For D enter the claimant's city, state and zip code
5. For E enter the claimant's telephone number
6. For F enter the remedial action site's name
7. For G enter the remedial action site's street address (Geographic number address only, PO Box # not accepted)
8. For H enter the remedial action site's city, state and zip code
9. For I enter the remedial action site's telephone number
10. For J check appropriate box identifying whether the claimant is the owner, operator or other-specify
11. For K check the box identifying the tank type for which this claim form is being submitted
12. For L enter the total dollar amount being submitted for reimbursement on this claim. The amount must match the amount entered on Form 1

DNR USE ONLY

13. Check appropriate box to identify completed phase(s) of project
14. Enter date of request for approval of activities at site
15. Sign and date form, and provide Position Title

SUBJECT: Monitoring of Remediation at Pressed Steel Tank Inc.,
FID 241037940
LUST

Dear Ms. Chung:

The purpose of this letter is to document operation of the groundwater remedial system at Pressed Steel Tank, Inc., 1445 South 66th Street, West Allis, Wisconsin. The remedial system described in the Remedial Design Report (GAS, 1996) prepared for the above referenced site by Graef, Anhalt, Schloemer and Associates (GAS) was implemented and has been operating since April, 1997. In brief, the remedial system was designed to address groundwater contamination associated with two commingled groundwater contaminant plumes; one resulting from an underground gasoline storage tank and the other resulting from chlorinated solvents of uncertain origin. The system consists of a tee-shaped recovery trench with a recovery sump (RW-1) at the cross of the tee (see Attachment 1 for a location map and remedial system layout). There is second recovery well that is located outside of the trench, several feet from the base of the tee (MW-1). This well is deeper than the recovery trench to recover a deeper zone of contaminated groundwater. Water pumped from the two wells is piped to the remediation building and is processed through a shallow tray air stripper. The treated water is then discharged to a storm sewer.

Influent and effluent samples were collected on a monthly basis since the onset of pumping (with the exception of September). Samples of the recovered water were collected from the discharge lines of both pumps. The results of these samplings are shown in table form in Attachment 2. Laboratory documentation can be found in Attachment 3. Graphic presentations of the detected contaminants over time were plotted for both wells and can be found in Attachment 2. Levels in MW-1 did not appear to have a trend. However, when total detected VOCs was graphed there appeared to be a downward trend (see Attachment 2). At RW-1 there were definite downward trends to the data, often decreasing by approximately an order of magnitude. The graph of the total VOC data shows a clear downward trend (see Attachment 2).

Air emissions were estimated using the influent sampling data from MW-1 and RW-1 and estimates of the total volume of water recovered. It was assumed that 100 percent of the

GRAEF
ANHALT
SCHLOEMER
and Associates Inc.

detected VOCs were volatilized by the air stripper (verified by the effluent sampling) and that the emission rate could be estimated from the chemical concentrations and total influent flows. Accordingly, a total mass was calculated and used to estimate an emission rate for the sampling period. The results of the calculations are presented at the bottom of the tables in Attachment 2. Emission levels for benzene, vinyl chloride and total VOCs were less than their respective limits.

Contaminant levels in the recovery trench and at MW-1 are decreasing in an approximately linear fashion. There has yet to be a tailing off of the recovery rate, or asymptotic trend to the recovery. As contaminant levels are still above regulatory limits, it is proposed that operation of the system be continued.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& Associates, Inc.

Job No: 97.10425

Page 1

Enclosed are the Analytical and Quality Control reports for the following samples submitted for analysis:

Sample Number	Sample Description	Date Taken	Date Received
270880	RW-1 Influent #908519	10/29/1997	10/30/1997
270881	MW-1 Influent #908519	10/29/1997	10/30/1997
270882	Effluent WS #908519	10/29/1997	10/30/1997

Soil results are reported on a dry weight basis. The above sample(s) may have a result flag shown on the report. The following are the result flag definitions:

A = Analyzed/extracted past hold time
B = Blank is contaminated
C = Standard outside of control limits
D = Diluted for analysis
F = Sample filtered in lab
G = Received past hold time
H = Late eluting hydrocarbons present
I = Improperly handled sample
J = Estimated concentration
L = Common lab solvent and contaminant
M = Matrix interference
P = Improperly preserved sample
Q = Result confirmed via re-analysis
S = Sediment present
T = Does not match typical pattern
W = BOD re-set due to missed dilution
X = Unidentified compound(s) present
Z = Internal standard outside limits

ANALYTICAL AND QUALITY CONTROL REPORT

Mr. Geoff Parish
GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES, INC.
345 N 95th Street
Milwaukee, WI 53226

12/04/1997

Job No: 97.11160

Page 1

Enclosed are the Analytical and Quality Control reports for the following samples submitted for analysis:

Sample Number	Sample Description	Date Taken	Date Received
276887	RW-1 Influent #908519	11/18/1997	11/19/1997
276888	MW-1 Influent #908519	11/18/1997	11/19/1997
276889	Effluent WS #908519	11/18/1997	11/19/1997

Soil results are reported on a dry weight basis. The above sample(s) may have a result flag shown on the report. The following are the result flag definitions:

A = Analyzed/extracted past hold time
B = Blank is contaminated
C = Standard outside of control limits
D = Diluted for analysis
F = Sample filtered in lab
G = Received past hold time
H = Late eluting hydrocarbons present
I = Improperly handled sample
J = Estimated concentration
L = Common lab solvent and contaminant
M = Matrix interference
P = Improperly preserved sample
Q = Result confirmed via re-analysis
S = Sediment present
T = Does not match typical pattern
W = BOD re-set due to missed dilution
X = Unidentified compound(s) present
Z = Internal standard outside limits

Dear Mr. Farley:

Enclosed is a DNR 4-B, Remedial Action and Operation/Maintenance and Environmental Monitoring Review, for your review and approval for the above referenced site. The form has been submitted for "Remedial Action (phase 2)" and "Operation/Maintenance and Environmental Monitoring (annual claim for remedial action activities) (phase 3)." The system has been in operation for approximately twelve months.

A prompt response to this request would be greatly appreciated. If you have any questions, please contact me at (414)259-1500. Thank you.

Sincerely,

GRAEF, ANHALT, SCHLOEMER

Milwaukee, WI 53226

Dear Mr. Parish,

RE: Pressed Steel Tank Property
1445 South 66th Street
West Allis, WI 53226

This letter is in response to your request for review and approval of the proposed remedial action plan for Pressed Steel Tank.

At the present time, the Pressed Steel Tank site is ranked a high priority with a score of 18. Based on this rank and score, a specific approval by the Department of Natural Resources is not required.

After touring the site in 1994, and reviewing the groundwater data, it was my opinion that the trench proposal would be the best option for groundwater remediation given the constraints of the site. Since two years have passed since the original proposal, I expect that groundwater contaminant levels will be confirmed prior to trench installation.

Since you specifically requested approval for the site, the Department hereby approves the plan as proposed. Please be aware that specific approvals will not be necessary in the future for the Pressed Steel Tank site.

Sincerely,

Charles J. Krohn
Hydrogeologist

APPENDICES

Appendix A	Cost Analysis

I. INTRODUCTION

Graef, Anhalt, Schloemer & Associates, Inc. (GAS) was retained by Pressed Steel Tank, Inc. to perform professional environmental services addressing the subsurface contamination detected during removal of one 1,000-gallon underground storage tank located at 1445 South 66th Street, West Allis, Wisconsin (Figure 1). The scope of site activities completed before this Remedial Action Option Report (RAOR) included removal of the 1,000-gallon underground storage tank and three sets of soil borings/monitoring wells. The first set of monitoring wells, MW-1A, MW-2A and MW-3A, were installed in April, 1990. The two other sets of wells were installed in May, 1991 (MW-4, MW-5 and MW-6) and December, 1992 (MW-7, MW-8, MW-9, MW-10, MW-1C and MW-1P).

A. Site History and Existing Conditions

Seamless Structural Company was organized into Pressed Steel Tank, Inc. by Robert Henry Hackney and has manufactured steel tanks and various foundry products for over 90 years. There were two underground storage tanks that were used for storage and dispensing of petroleum product on the site.

A 1,000-gallon underground storage tank was located at the northwest corner of South 66th Street and West National Avenue. The age of the tank was unknown; however, it was reported to be older than 30 years. The 1,000-gallon tank, which was removed September 19, 1989, was used as a source of gasoline for in-plant trucks. The tank reportedly contained only gasoline. No records of inventory or periods of non-operation are available. The tank was never leak tested, repaired or replaced.

B. Regulatory Status

The site was classified by the Wisconsin Department of Natural Resources as being regulated under Wisconsin Statute 144.76(3), or the "spills law." Petroleum related hazardous materials in the soils and groundwater at the site are being managed as special waste. The site is a LUST site and the former UST is registered. The site is eligible for Petroleum Environmental Cleanup Fund Act (PECFA) participation, and has been involved in the PECFA program since 1989.

FIGURE 1

The Wisconsin Department of Natural Resources (WDNR) was contacted on February 1, 1995, regarding the ranking of the site into either high, medium or low priority. The site had not yet been ranked, however based on WDNR familiarity with the site it would not be ranked in the high category. As such, the WDNR will not be actively participating in management of the remainder of the project.

In accordance with the requirements of NR 720.09(1) wherein the procedures for applying generic soil Residual Contaminant Levels (RCLs) are described, the pertinent site characteristics can be described as follows: (i) contamination in the site soils is gasoline range organics (GRO); (ii) the horizontal and vertical degree and extent of contamination have been defined and are summarized below; (iii) the depth to carbonate bedrock is approximately 140 feet below ground surface (bgs); (iv) the thickness of the contaminated soils is approximately ten feet; and (v) none of the contaminants are known to facilitate transport or to have cosolvent effects. The RCLs for specific compounds as specified in NR 720.09(3)(a) are 5.5 parts per billion (ppb) for benzene, 2,900 ppb for ethylbenzene, 1,500 ppb for toluene, and 4,100 ppb for total xylenes. The geometric mean of the hydraulic conductivity measurements at the site is 1.1×10^{-5} cm/s. As specified in NR 720.09(4) for sites with a hydraulic conductivity of greater than 1×10^{-6} cm/s, the cleanup objective would then be 100 parts per million (ppm) for GRO contamination.

C. Nature and Extent of Contamination

The extent of petroleum related soil contamination was defined at the site by several rounds of soil boring investigations. The extent was defined to the west by the borehole for MW-5, which was clean. To the northwest the extent was defined between SB-4 that was contaminated at 470 ppm total petroleum hydrocarbons (TPH) and SB-8, which was clean. To the north the extent was defined between SB-2 that was contaminated at 550 ppm TPH and SB-9, which was clean. In the area of the tank excavation, SB-10 was contaminated at 92 ppm GRO, 400 ppb benzene, 4,000 ppb ethylbenzene, 2,700 ppb toluene, and 15,000 xylenes. No contamination was encountered west of SB-10 in the borehole for MW-8 or to the south in the borehole for MW-7. The sample collected from five feet into the eastern wall of the tank excavation (underneath the sidewalk adjacent to South 66th Street) had 100 ppm TPH (Figure 2).

Groundwater samples from three monitoring wells, MW-1, MW-1C and MW-2, indicated detects of petroleum related contamination exceeding WDNR regulatory limits. The extent of

FIGURE 2

petroleum related groundwater contamination is defined by clean wells to the north at MW-9, to the northwest by MW-5, to the west by MW-8, to the south by MW-7, to the southeast by MW-4 and MW-6 and to the east by MW-3 and MW-10. The vertical extent is defined by the deep piezometer MW-1P. Based on laboratory results, the extent of petroleum related groundwater contamination is illustrated in Figure 3.

D. Geologic and Hydrogeologic Characteristics

The sediments encountered during remedial investigation at the site ranged in texture from clays to sands. Sands were encountered adjacent to the loading dock extending from the surface to 11 feet below ground surface (bgs). Sands were also encountered below the parking lot at the northeast corner of South 66th Street and West National Avenue from 17 to 24 feet bgs. It is not known if the sands at the loading dock are continuously connected to the sands below the parking lot. All other sampled locations had sandy clays, silty clays or clays. Sandy soils are typically more amenable to remediation by common technologies such as soil vapor extraction and groundwater pump and treat. It is also anticipated that the higher permeability soils would be remediated more quickly than the lower permeability clayey soils.

The site is located in an industrial area and as such the on-site and adjacent paved and developed areas limit recharge to the shallow groundwater. Groundwater was encountered on the site at one to seven feet bgs. At two monitoring wells, MW-2A and MW-3A, the water table is located within sand; whereas, at all other investigated locations, the water table is located in clay. Groundwater flow is to the south and east. The horizontal gradient of the water table ranges from approximately 0.01 to 0.07 ft/ft. The vertical gradient was measured at the MW-1 well nest. The gradient between MW-1C and MW-1A is 0.039 ft/ft downward and is 0.77 ft/ft downward between MW-1C and MW-1P.

II. REMEDIAL ACTION OPTIONS

In accordance with the requirement of NR 722.07(2), which requires a preliminary screening of remedial options, several methods of remediating the site were considered. Neither air sparging or soil vapor extraction will be considered as a possible option because of the low site hydraulic conductivity.

FIGURE 3

A. Soil Excavation and Groundwater Recovery from Sumps

A possible remedial alternative is excavation of the petroleum contaminated soils below the loading dock. Soils would be excavated to the 100 ppm GRO limit or to the extent practicable, given the limits imposed by the presence of the building to the north, South 66th Street to the east , National Avenue to the south and the various utility lines that transect the impacted area. The base of the excavation would be graded to drain into a sump pit. A large diameter screened PVC pipe would be installed in the pit to allow for draining of the excavation.

After contaminated soils are removed and the floor graded, the excavation would be backfilled with granular material and compacted. The granular material would allow for groundwater recovery from the adjacent contaminated soils below the building and along the utilities. The excavated soil could be either landfilled in a Subtitle D approved landfill.

Groundwater would be either pumped on a quarterly interval using level switches in the sump. The pumped groundwater would be either treated and discharged to a storm sewer or treated and discharged to a sanitary sewer.

The above remedial action would comply with the requirements of NR 722.09(2); which requires that the remedial alternative restores the environment, to the extent practical; and minimizes harmful effects to the air, lands and waters. The above treatment alternative would remove the remaining accessible contaminated soils to the applicable NR 720 standard, and thus remove the significant sources of future groundwater contamination. Excavation would continue below the water table in the low conductivity sediments, which would result in removal of contaminated groundwater exceeding the NR 140 groundwater quality standard.

The groundwater recovery system performance would be monitored quarterly to determine if the groundwater quality levels are approaching NR 140 cleanup objectives. Should the groundwater quality levels plateau above the NR 140 cleanup objectives, based on four quarters of data, the system configuration / operation would be re-evaluated.

The volume of contaminated soils is estimated at 1,110 cubic yards (cy). As this is less than the 2,000 cy limit requiring WDNR approval per NR 722.09(4)(b)2, WDNR approval would not be necessary. Landfill approval of the waste stream would be required. A WDNR

Bureau of Air Management Form 4400-120 (Application to Treat or Dispose of Petroleum Contaminated Soil) would have to be filed. A Wisconsin Pollution Discharge Elimination System (WPDES) permit from the WDNR would be required for the groundwater treatment system effluent to a storm sewer. As would permission from the Milwaukee Metropolitan Sewerage District (MMSD) to discharge to a sanitary sewer.

B. Passive Bioremediation of Soils and Groundwater Recovery from Wells

A possible remedial alternative is passive/active bioremediation of the soil contamination and groundwater pump and treat from several closely spaced wells. Progress of the soil remediation would be monitored on a yearly basis by collecting a soil sample for GRO and bioenumeration analyses. If soil contamination does not appear to be cleaning up, based on two successive sampling events, amendments of site nutrients would be evaluated for implementation. Groundwater recovery wells could alternatively switched off from a pumping mode and operated in an infiltration mode to deliver nutrients to the site to expedite bioremediation of the soils.

The above remedial action would comply with the requirements of NR 722.09 (2); which requires that the remedial alternative restores the environment, to the extent practicable; and minimizes harmful effects to the air, lands and waters. The soil contamination level would be monitored to verify that levels are approaching the applicable NR 720 standard.

The groundwater recovery system performance would be monitored quarterly to determine if the groundwater quality levels are approaching NR 140 cleanup objectives. Should the groundwater quality levels plateau above the NR 140 cleanup objectives, based on four quarters of data, the system configuration/operation would be re-evaluated.

Contaminated soils excavated during well installation and remedial system installation (connection trenches) are anticipated to total to less than the NR 722.07(3)(b)1 of 250 cy. As such, these soils could be landfilled without detailed evaluation of alternative remedial options. Landfill approval of the waste stream would be required. A WDNR Bureau of Air Management Form 4400-120 (Application to Treat or Dispose of Petroleum Contaminated Soil) would have to be filed. A WPDES permit from the WDNR would be required for the groundwater treatment system effluent to a storm sewer. As would permission from the MMSD to discharge to a sanitary sewer. As this project is a PECFA project, it will be

necessary to obtain approval for the Remedial Action Option Report from DILHR as per ILHR 47.33(1)(c).

C. Passive / Active Bioremediation of Soils and Groundwater Recovery from Trenches

The remedial option identified during the Remedial Investigation / Feasibility Study as the recommended alternative was monitoring of passive/active bioremediation of soil contamination with evaluation after one year to determine if site nutrients need to be amended to expedite soil remediation, and groundwater recovery from a series of trenches.

Progress of the soil remediation would be monitored by collecting soil samples annually. The samples would be analyzed for GRO, petroleum volatile organic compounds (PVOCs), enumeration of total heterotrophs, and enumeration of total degraders. If significant reduction of contamination is not observed, site nutrient conditions would be evaluated and amended. Nutrients could be infiltrated through the groundwater recovery trenches (after a cessation of pumping) and in site monitoring wells.

Groundwater trenches would be connected and sloped to a common sump (Figure 4). The sump would consist of a section of large diameter slotted PVC piping. A low flow, explosion proof groundwater pump would be placed in the sump to recover in-flowing groundwater. Level switches in the sump would be used to control cycling of the recovery pump. If technically and economically feasible, monitoring well MW-1A (two-inch diameter) would be retrofitted with a pump to capture deeper groundwater contamination observed in the vicinity of MW-1A. Otherwise, a standard four-inch diameter well would be constructed to replace MW-1A and be used as a recovery well.

The pumped groundwater would either be treated and discharged to a storm sewer or treated and discharged to a sanitary sewer. The groundwater recovery system would be operated continuously. The performance would be monitored quarterly to determine if the groundwater quality levels are approaching NR 140 cleanup objectives. Should the groundwater quality levels plateau above the NR 140 cleanup objectives based on four quarters of data, the system configuration/operation would be re-evaluated.

FIGURE 4

Contaminated soils excavated of groundwater recovery trenches and remedial system installation are anticipated to total less than the NR 722.07(3)(b)1 of 250 cy. As such, these soils could be landfilled without detailed evaluation of alternative remedial options. Landfill approval of the waste stream would be required. A WDNR Bureau of Air Management Form 4400-120 (Application to Treat or Dispose of Petroleum Contaminated Soil) would have to be filed. A WPDES permit from the WDNR would be required for the groundwater treatment system effluent and permission from the MMSD to discharge to a sanitary sewer. This being a PECFA project, it will be necessary to obtain approval for the Remedial Action Option Report from DILHR as per ILHR 47.33(1)(c).

D. Passive Bioremediation of Soils and Groundwater

Consideration of passive bioremediation as a remedial option is required at sites where the remedial investigation began after January 15, 1993 per ILHR 47.335(3)(a). The remedial investigation at this site began in 1990. Therefore, passive bioremediation is not required to be evaluated as a remedial option. Also, NR 722.07 notes that remedial options that are not suitable for a site need not be considered. The high levels of petroleum contamination in site groundwater vitiate the applicability of passive bioremediation of all site contamination. Therefor this option will not be considered further.

III. SELECTED REMEDIAL OPTION

A. General Description

The remedial action selected from those described above is passive/active bioremediation of soil contamination and groundwater recovery and treatment using recovery trenches. This action was chosen because of the comparative simplicity over the other actions. This option is the least costly of the three evaluated optoins, assuming groundwater remediation would require five years to accomplish. The trenching option would cost $366,855 after five years, the groundwater recovery well option would cost $423,612 after five years, and the soil excavation and groundwater pumping would cost $403,413 after five years (Appendix A).

B. Site Safety Plan

The contractor will be required to prepare a site safety plan for its personnel and specifically designed for the Pressed Steel site. A separate safety plan specific to the site will be prepared by GAS for its on-site personnel.

C. Contingencies

In the event water enters the excavation due to rain or other unforeseen circumstances, a contingency plan will be made by the contractor for the removal, treatment, and disposal of the water. Any water removed for treatment must be handled according to local, state, and federal regulations.

D. Remedial Action Implementation

As stated in Chapter NR 724, a remedial design report is to be prepared prior to the development of the remedial system construction plans and specifications. These two items are now being developed concurrently. Following development of the remedial system construction plans and specifications a bid package will be submitted to qualified contractors. A minimum of three quotes will then be obtained from qualified contractors. The selected contractor is expected to have the ability to complete the specified work in a timely and cost-effective manner and within WDNR regulations.

E. Monitoring Plan / Performance Measurement

In order to determine the effectiveness of the system, a soil and groundwater monitoring plan will be implemented.

1. Soil Monitoring

One soil sample will be collected annually near the loading dock as shown on Figure 4, and submitted to a WDNR-certified laboratory for analysis of GRO and PVOCs in accordance with WDNR published guidelines. A Geoprobe hollow drill rod will be hydraulically driven to the desired depth and then retracted to obtain the sample. This method is less intrusive than standard hollow / solid stem auger techniques.

2. Groundwater Monitoring

Monitoring wells MW-1A, MW-1C, MW-1P, MW-2A, MW-3A, MW-4, and MW-7 will be sampled semi-annually per published WDNR guidelines until contaminant levels in all the wells are below their respective NR 140 enforcement standards. The wells will then be

sampled semi-annually for an additional year to demonstrate compliance with NR 140 enforcement standards.

The collected groundwater samples will be submitted to a WDNR-certified laboratory for analysis of GRO and PVOCs.

3. System Performance Measurement

GAS will sample the influent and effluent streams of the system weekly for the first four weeks and then biweekly for a minimum of three months. A reduction in sampling frequency may be requested at that time. Sample parameters will be GRO and selected VOCs.

F. Report Preparation

A case closure report will be prepared that discusses the results of the remedial site activities. The report will provide a discussion summarizing remedial activities and make specific recommendations regarding the site's environmental conditions relative to site closure. The report appendices will include completed WDNR required forms, photographs of pertinent site activities, laboratory reports, and field screening logs as required under Chapter NR 726 regarding case closure.

RE: METHOD FOR SEPARATION OF NON-ELIGIBLE COSTS FROM CLAIM
CLAIM 53214-4936-45
PRESSED STEEL TANK INC, 1445 S 66TH ST, WEST ALLIS

Dear Mr. Strzelec:

Thank you for having your consultant submit your proposed method for removing non-eligible chlorinated solvent investigation and remediation expenses from your present claim and for future PECFA claims for this site. The Department has reviewed the proposed method dated April 4, 1995 and offers the following response.

Your consultant's proposal that only 2.88 percent of the costs incurred by Pressed Steel be deemed non-eligible is **not acceptable**. Section ILHR 47.30(4) of Wis. Admin. Code states:

(4) CONTAMINATIONS CONTAINING ELIGIBLE AND INELIGIBLE PRODUCTS. When a contamination is identified which contains both eligible and ineligible products under the fund, only the costs associated with the eligible products may be claimed. Eligible costs of remediation, which are only associated with the eligible product, may be claimed in their entirety, as specified in this section. **Any costs required because of the presence of an ineligible product may not be claimed *even if a remedial benefit may be derived* by the remediation of the eligible product.**

Your consultant's proposed method does not account for the removal of actual costs obviously incurred because of the presence of the non-eligible chlorinated solvents at this site.

Current Claim

The Department requires that you identify the following costs associated with the following wells for removal from the current claim for the reasons indicated.

- Piezometer MW-1P: Chlorinated VOC compounds are heavier than water. Regardless of the side benefit gained (wherein it was found that petroleum constituents did not migrate downward at MW-1P) clearly the original intent of installation and sampling of this piezometer was to investigate the extent of vertical migration of the non-eligible chlorinated VOC contaminants (see attached workplan). If vertical migration of *petroleum* was ever truly a concern, then logic would dictate that your consultant should have installed one or more additional piezometers in the area of greatest petroleum contaminant concentrations, near MW-2A. The Department contends that *at least* 50% of all consultant and commodity costs to plan, install, develop and perform initial sampling of this piezometer for the full range of VOCs be removed from the current claim. Furthermore, it is clear

that the full VOC lab scan is required because of the presence of non-eligible chlorinated VOCs; therefore, reimbursement for all subsequent lab work for VOCs can only be reimbursed to the cost equivalent of performing the less expensive PVOC scan.

- Monitoring well MW-8: Your consultant's original justification for installing MW-8 was to check for chlorinated VOC contaminant migration along an abandoned rail spur (see attached figure). At the time your consultant contended that MW-5 served to identify the extent of *petroleum related contamination*, but failed to identify the western extent of *chlorinated VOC contamination*. Well MW-8 was proposed for this purpose. Once installed, no petroleum constituents were identified in samples collected from MW-8. Your consultant now contends (letter of March 24, 1995) that this well functioned to define the extent of both chlorinated VOC and petroleum contamination. It is clear that the original intent of this well was to address chlorinated VOC contamination. The Department requests that 50% of all consultant and commodity costs to plan, install, develop and initially sample this well for the full range of VOCs be removed from the current claim. Subsequent to the initial sampling event, costs incurred to sample and test this well for *PVOCs* will be considered for reimbursement in full. Because of the non-eligible compounds at your site, reimbursement for all subsequent lab work for VOCs can only be reimbursed to the cost equivalent of performing the less expensive PVOC scan.

- Monitoring well MW-1C: The Department views the installation of this well in such near proximity to existing well MW-1A as duplicative effort. Both are understood to be water table wells installed with the intent to identify the presence of petroleum contamination. It appears that, since the first to be installed (MW-1A) failed to identify the presence of anything but chlorinated solvents, the second was installed just a few feet away from the first to re-establish the results of the first. The cost associated with the installation, sampling and analysis of one of these two wells is not reimbursable and must be identified and removed from the current claim.

Future Claims

The *method* proposed by your consultant could work well to separate out the *portion* of non-eligible costs associated with long term operation of a groundwater pump and treat, soil vapor extraction, or other remedial system installed to remediate the eligible petroleum constituents. However, the Department requests that your calculation not use the analytical results of the Wisconsin GRO test method to form the basis for the amount that is considered PECFA eligible. First, your method is based on concentrations above the applicable ch. NR 140 enforcement standard for each compound. There is no ch. NR 140 enforcement standard established for GRO. Second, the GRO test method does not differentiate between eligible and non-eligible compounds present in the sample. Instead, it lump sums them all together as one numerical result. Therefore, a significant portion of the total GRO concentration in certain samples from your site may actually be attributable to the non-eligible contaminants present rather than the eligible petroleum contaminants present in the sample. The end result in using the GRO result in your calculation is that it unfairly allocates a larger percentage of contaminants to the "PECFA eligible" percentage. Please correct for this in your next submittal. The

Department suggests you plot a new set of contaminant contours based on the sum of the concentrations of individual petroleum-related VOCs (PVOCs), and replace the GRO data with the newly plotted PVOC data.

For future claim submittals, the Department requires that all obvious costs (for example, the additional cost for VOC analysis rather than PVOC analysis) associated with the investigation and monitoring of the non-eligible chlorinated solvents would have to be identified on all invoices and reduced from the claim prior to submittal. In addition, the value of any remedial benefits gained for the removal and treatment of non-eligibles that are not clearly defined, such as the cost associated with removing and treating groundwater contaminated with the chlorinated VOCs along with the eligible petroleum contaminants, the Department will require a pre-determined additional percentage to be removed in accordance with the method approved by the Department.

Please resubmit **within 15 working days** a method that both identifies the amount to be removed from the current claim and the amounts that will be removed from future claims for this site taking the above information into consideration. Include with your response a copy of 1) any correspondence or reports regarding the gasoline UST closure, and 2) the 1994 RI/FS Report that was prepared by GAS. **If this information is not received by Friday, May 12, 1995, your claim will be returned for resubmittal .** The date of receipt of the resubmitted claim will determine the claim's location in the audit line. The current backlog for claim review is approximately eight months.

Sincerely,

Stanley A. Senger

Project No. 908519

VIII. COST ESTIMATE

A cost estimate for the three phases is as follows:

Phase I		
GAS Costs		$ 2,836
Laboratory Costs		$ 2,674
Equipment and Supplies		$ 290
	TOTAL	$ 5,800
Phase II		
GAS Costs		$ 12,535
DRILLERS COSTS		$ 11,000
Laboratory Costs		$ 10,035
Equipment and Supplies		$ 530
	TOTAL	$ 34,100
Phase III		
GAS Costs		$ 16,785
DRILLERS COSTS		$ 7,500
Laboratory Costs		$ 1,175
Equipment and Supplies		$ 3,440
	TOTAL	$ 28,900
TOTAL ALL PHASES		**$ 68,800**

Of the above expenses, it is anticipated that approximately $1,120 of the Phase I costs, $9,625 of the Phase II costs, and $1,000 of the Phase III costs would be directly attributed to investigation of the VOC contamination and not PECFA reimbursable.

RE: Claim #53214-4936-45
Pressed Steel Tank, Inc., 1445 South 66th Street, West Allis, Wisconsin

Dear Mr. Senger:

This letter is in response to the March 28, 1995 letter from Mr. Warren E. Bohlman regarding the above referenced PECFA claim. Wherein Mr. Bohlman stated that a methodology/approach for division of eligible versus ineligible costs be submitted, because of the halogenated hydrocarbon compounds commingled with petroleum hydrocarbons at the Pressed Steel Tank, Inc. (PST) site. Accordingly, Graef, Anhalt, Schloemer & Associates (GAS) developed the following methodology on behalf of PST.

The mass of compounds requiring remediation at the site was determined so that relative percentage of petroleum versus nonpetroleum related compounds could be determined. The total concentration of halogenated volatile organic compounds at levels above their respective Enforcement Standard present at a well were added. The total concentration of a compounds was used if there was no Enforcement Standard (please see attachments).

Similarly, the levels of gasoline related compounds (GRO) below their respective Enforcement Standards were subtracted from the GRO for wells. The results were then contoured (please see attachments) and the contoured distributions used to determine the relative masses of contaminants present requiring remediation.

The groundwater contaminant plume was assumed to be 12 feet thick. The soils were assumed to have an effective porosity of 15 percent. Using the above described methodology a total of 0.17 pounds of total VOC are present that require remediation (please see attachments). Similarly, a total of 5.78 pounds of GRO are present that require remediation. The VOCs then account for 3 percent and GRO accounts for 97 percent of the compounds present that require remediation. Based on the above described percents of compounds requiring remediation, it is suggested and recommended that the percent reimbursement be based on a 97 percent PECFA eligibility basis.

If you have any questions or require additional information, please call us at (414) 256-4060.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

Re: Pressed Steel Tank Inc.
PECFA Claim #53214-4936-45

Dear Mr. Bohlman:

The following is submitted to you in response to your verbal request of March 13, 1995.

Per my discussion with you on March 13, 1995, you had indicated that based upon the cost estimate which was provided in the GAS Work Plan (September 1992), 19 percent of the eligible costs for Phase I and 28 percent of the eligible costs for Phase II would be ineligible for PECFA reimbursement. Initial information contained in the September 1992 Work Plan on the nature of groundwater quality in the area of the MW-1 well nest was not indicative of gasoline related groundwater contamination. As such, the extent of gasoline related groundwater contamination needed no further definition to the south and west. The justification to investigate the extent of VOC contamination at the proposed wells in September 1992, specifically MW-8 and PZ-1, was based on the assumption that there was not gasoline contamination at the MW-1 well nest. In November 1992, GRO contamination was encountered in the newly installed MW-1C, the shallow water table well in the MW-1 well nest (GAS, 1994 RI/FS Report). ← get copy of report Petroleum contamination was confirmed at both locations (MW-1 and MW-1C) during the November 1993 sampling event.

Had the preceding information been known at the time the September 1992 Work Plan was developed, wells MW-8 and PZ-1 would have been necessary to investigate the extent of petroleum contamination. Furthermore, had the work plan been presented after the November 1992 sampling event, wells MW-8 and PZ-1 would have been associated with the gasoline contamination and not VOC contamination as originally proposed. These two wells functioned to define the extent of both the GRO and VOC contamination. As such, neither of these wells can be selectively and uniquely attributed to VOC contamination investigation. ~ Both ~ 50:50.

Based upon the above information, reimbursement for the work efforts associated with both these wells should not be denied for reimbursement as both wells were required for the gasoline UST investigation. As stated in ILHR 47.30 (b) 4. "Laboratory services for testing specific to this chapter, including full VOC testing during the investigation phase..." are eligible cost items for remediation. The claim was submitted for a

progress payment for the completion of Site Investigation and Proposed Remedial Action Plan. Therefore, the work efforts for both wells as well as the VOC testing is eligible for PECFA reimbursement and should not be considered ineligible based upon an approximated cost percentage. ILHR 47.30(4)

If you have any questions, please give Geoff or I a call at (414) 256-4060. Thank you.

Sincerely,

GRAEF, ANHALT, SCHLOEMER

I. INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was retained by Pressed Steel Tank, Inc. to perform professional environmental services to address the subsurface contamination detected during removal of one 1,000-gallon underground storage tank located at 1445 South 66th Street, West Allis Wisconsin (Figure 1). The scope of site activities completed before this Remedial Investigation/Feasibility Study (RI/FS) included removal of the 1,000-gallon underground storage tank and three sets of soil borings/monitoring wells. The first set of monitoring wells, MW-1A, MW-2A and MW-3A, were installed in April, 1990. The two other sets of wells was installed in May 1991 and December 1992.

A. Site History and Existing Conditions

Seamless Structural Company was organized into Pressed Steel Tank, Inc. by Robert Henry Hackney and has manufactured steel tanks and various foundry products for over 90 years.

A 1,000 gallon underground storage tank was located at the northwest corner of South 66th Street and West National Avenue. The age of the tank was unknown, however, it was reported to be older than 30 years. The 1,000-gallon tank, which was removed September 19, 1989, was used as a source of gasoline for in-plant trucks. The tank reportedly contained only gasoline. No records of inventory or periods of non-operation are available. The tank was never leak tested, repaired or replaced.

B. Geology and Hydrogeology

The basic geology of southeastern Wisconsin is reasonably uniform. Above the Precambrian crystalline basement (older than 570 million years), the rock units are slightly inclined sedimentary strata deposited in marine environments between 505 million and 350 million years old. The bedrock is capped by more than 300 feet of glacial sediments deposited primarily by the Lake Michigan Lobe of several stages of continental glaciation during the Pleistocene Epoch. Post-glacial processes have eroded and developed soils in the glacial deposits and exposed bedrock.

1. Soils

Soils in the Pressed Steel Tank, Inc. project area are part of the Ozaukee-Morley-Mequon Association. These soils develop in thin layers of loess (wind transported silty sediments) over silty clay loam glacial till. The site occurs outside the area of detailed soils series mapping. However the original site soils were probably silty clay loams developed in glacial tills.

The soils encountered at the site ranged in texture from clays to sands. Sands were encountered adjacent to the loading dock extending from the surface to 11 feet below ground surface (bgs). Sands were also encountered below the parking lot at the northeast corner of South 66th Street and West National Avenue from 17 to 24 feet bgs. It is not known if the sands at the loading dock are continuously connected to the sands below the parking lot. All other sampled locations had sandy clays, silty clays or clays. Sandy soils are typically more amenable to remediation by technologies such as soil vapor extraction and groundwater pump and treat. It is also anticipated that the higher permeability soils would be remediated more quickly than the lower permeability clayey soils.

A groundwater recovery well was planned to be installed adjacent to MW-2 in order to recover groundwater from the more permeable sediments encountered in the borehole for MW-2. Soils encountered in the recovery well borehole were similar to those in the MW-2 borehole.

2. Glacial Geology

The landforms and surface deposits of Milwaukee County are, for the most part, a result of glaciations during the Woodfordian phase of the Late Wisconsinan Stage (Pleistocene Series time period). A series of recessional moraines, formed by the Lake Michigan Lobe, occur in north-trending ridges throughout the county (Figure 2). Deposits are predominantly tills (mixtures of clay, silt, sand and rocks resulting from the erosion, attrition and transport of geological materials by glacial ice) with minor amounts of outwash (sediments transported and deposited by glacial meltwaters) in the north, east and south-central part of the county. The estimated thickness of glacial deposits at the site is 140 feet, based on water well contractor construction reports.

FIGURE 2

The project site is located in the west-central section of Milwaukee County within the Lake Boarder Moraine System. As such, a complex suite of sediments were expected, ranging from glacial tills, to glacial outwash, to proglacial lacustrine deposits (fine grained sediments deposited in lakes along a glacier. The deposits at the site were interpreted as glacial till, Oak Creek Formation, based on inspection of samples obtained from boreholes, borehole logs and existing maps. The nature of the sandy sediments at the site is unknown. No evidence was observed to indicate that the sandy sediments were fluvial (river), glacial outwash or strand line deposits (beach environment).

A water well contractor construction report for a supply well at the project site indicated that there was clay from 0 to 66 feet below ground surface (bgs), shale [sic] from 66 to 73 feet bgs, sandy clay from 73 to 95 feet bgs and sand and gravel from 95 to 111 feet bgs. A shale boulder may have occurred at 66 feet bgs, but it is not very probable that there would be a seven foot thick shale boulder in glacial sediments, given the soft nature of most shales. A well located to the southeast at 1737 South 64th Street was originally completed at 67 feet bgs, an indication that a coarser-grained water-bearing unit occurred at this depth. There was probability a weathered gravel deposit where the shale was logged. Other well logs for the project area indicate that the first coarse-grained water bearing unit occurs from 60 to 70 feet bgs. Because of the depth to this unit it is unlikely that contamination encountered to date at the water table has impacted this water bearing unit.

Well logs for the project area indicate that there is between 50 to 70 feet of clayey sediments between the above mentioned coarser-grained unit and dolomite bedrock. These sediments are probably glacial tills (New Berlin and possibly Tiskilwa Formations). Such a thickness of sediments makes it very unlikely that the dolomite aquifer would be affected by contamination in the shallow saturated sediments at the site.

3. Bedrock Geology

The uppermost bedrock units of Milwaukee County are nearly horizontally-bedded sedimentary strata. The northeastern one-seventh of the county is Devonian System dolomites and shales of the Milwaukee Formation (Figure 3). Underlying the Milwaukee Formation and occurring as the uppermost unit in the remaining six-sevenths is Silurian System dolomite (Niagara Formation). The bedrock underlying the Silurian System dolomite are rock units ranging in age from Precambrian through Ordovician Age. In

general, the sedimentary units dip gently to the east toward the Michigan Basin. From the oldest (deepest) to the youngest, the rock units are: Precambrian crystalline rocks, Cambrian sandstones (Mount Simon, Eau Claire, Galesville and Franconia sandstones) and Ordovician sandstones, dolomites and shales (Prairie du Chien Dolomite, St. Peter Sandstone, Platteville, Decora, and Galena Dolomites, Maquoketa and Neda Shales). Bedrock at the site occurs at approximately 140 feet below ground surface.

The Niagara dolomite, where saturated, is the upper bedrock aquifer unit. The Ordovician dolomites and Cambrian sandstones are the lower bedrock aquifer.

4. Groundwater

The site is located in an area where approximately 140 feet of unconsolidated sediments cover the upper bedrock aquifer. Because of the thickness of low conductivity sediments above the bedrock aquifer (at least eighty feet) and the total thickness of sediments (140 feet), it is doubtful that the bedrock aquifer will be affected.

The site is located in an industrial area and as such the paved and developed areas limit recharge to the groundwater table. Groundwater was encountered on the site at one to seven feet bgs. At two monitoring wells, MW-2 and MW-3, the water table is located within sand; whereas, at all other investigated locations, the water table is located in clay. Groundwater flow is to the south and east. The horizontal gradient of the water table ranges from approximately 0.01 to 0.07 ft/ft.

The vertical gradient was measured at the MW-1 well nest. The gradient between MW-1 and MW-1A is 0.039 ft/ft downward and is 0.77 ft/ft downward between MW-1C and MW-1P.

II. CONTINUING INVESTIGATION

A. Summary of Site Investigative Activities

1. Groundwater Sampling

On November 9 and 10, 1992, GAS personnel were on site to collect groundwater samples from existing monitoring wells installed during previous investigations, and to

establish current groundwater quality for comparison to data from previous sampling rounds. Previously installed monitoring wells MW-1A, MW-2A, MW-3A, MW-4, MW-5 and MW-6 were sampled in accordance with WDNR guidelines and the samples submitted to National Environmental Testing, Inc. (NET) for analysis of gasoline range organics (GRO) and volatile organic compounds (VOCs). Gasoline related compounds were detected only in well MW-2; GRO was detected at 53,000 ppb, ethylbenzene was detected at 7,200 ppb, toluene was detected at 2,800 ppb and xylenes were detected at 25,000 ppb. Previously xylenes were detected in MW-3, but none were detected in November, 1992 (Appendix B).

2. Soil Borings and Monitoring Wells

To define the extent of contamination, GAS personnel were on site on December 14, 15 and 16, 1992 to supervise drilling of six environmental boreholes and installation of five monitoring wells and one piezometer by Layne-Northwest (Figure 4). All six boreholes were converted to monitoring wells designated as MW-1C, MW-1P, and MW-7 through MW-10 (Appendices C and D). Monitoring well MW-1C was located to determine the shallow groundwater quality adjacent to the former tank location. Monitoring well MW-1P was drilled to determine the deep groundwater quality in the vicinity of MW-1A because of the previous GRO detection.

With the exception of the borehole for MW-P1, boreholes were sampled continuously using two foot long split-spoon soil samplers. The borehole for MW-P1 was blind drilled to the base of the interval sampled in the MW-1A borehole, 39 feet bgs, then sampled to a depth of 46 feet bgs for stratigraphic information and field screening purposes only.

3. Groundwater Monitoring

On October 27, 28 and November 3, 1993, GAS personnel were on site to collect groundwater samples. Monitoring wells MW-1, MW-1C, MW-1P, MW-2, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9 and MW-10 were sampled in accordance with WDNR guidelines and the samples submitted to National Environmental Testing, Inc. (NET) for analysis of GRO, petroleum volatile organic compounds (PVOC) and those VOCs detected during previous sampling events (GAS, *Workplan*, June 1993 and Appendix B). Samples were collected with disposable bailers using bottom emptying devices. Samples were placed in laboratory supplied containers with the appropriate

preservatives. Samples were stored on ice and sent to NET with chain-of-custody documentation.

B. Sampling Methods

1. Sampling Methods Used

The soil and groundwater sampling and preservation methods used were approved WDNR procedures current at the time of the investigation.

a. Soil Sampling

Soil samples were obtained from boreholes using two foot long split-barrel sampling devices (split spoons). The length of each sampling interval was two feet. Upon retrieval from a borehole the spoons were opened to reveal the sediment sample. A clean sampling tool was used to obtain an approximately 20-gram sample. The sample was immediately placed in a 40-ml VOA vial and sealed. The sample bottle was then placed on ice in a cooler. Another representative soil sample was then placed in an eight once jar, the jar sealed with aluminum foil and placed in a heated area to allow for volatilization. After the sample jar was warmed for at least 15 minutes, the head space of the sample was screened for VOCs with a photoionization detector. The interval blow count, length of sample recovered, geological nature of the sediments, Munsell color, Unified Soil Classification System (USCS) classification, estimated moisture content and volatile organic compound field screening detection (photoionization or flame ionization detector) were logged. After reviewing the field screening results for all samples from a boring, the samples that would be submitted to the laboratory were chosen. The chosen samples were then preserved by injecting 20 ml of reagent grade methanol through the septum of the sampling vial. The preserved samples were then returned to the cooler. Laboratory samples were sent to NET laboratory in Watertown, Wisconsin accompanied by chain-of-custody documentation.

b. Groundwater Sampling

Before groundwater samples were collected, the elevation of all site monitoring wells was measured to allow for determination of groundwater flow directions on the day samples were collected. If possible, monitoring wells were purged of four well casing volumes to

remove stagnant water. Monitoring wells were purged and sampled with new, clean disposable bailers. Samples collected for VOC and GRO analysis were obtained from bailers with bottom emptying devices and placed in 40 ml VOA vials. Samples were preserved with several drops of hydrochloric acid and carefully capped to avoid entrapping any air bubbles. Samples collected for lead analysis were obtained from bailers with bottom emptying devices and placed in a positive pressure pumping device. The samples were pumped through new, disposable, in-line, 45 micron filters. Samples were placed in 250 ml plastic bottles containing nitric acid as a preservative, placed on ice in a cooler and sent to NET laboratory in Watertown, Wisconsin accompanied by chain-of-custody documentation. The color, clarity, temperature, and conductivity of the samples were recorded in the field at the time of sampling.

2. Quality Assurance/Quality Control

Internal quality assurance/quality control documentation for the laboratory is available from NET. No duplicate soil samples were collected. Trip blanks were used during the last three rounds of groundwater sampling as a mechanism to test for background laboratory contamination. Trip blanks were prepared by NET, transported to the site and sent to the lab with the groundwater samples for analysis of the same parameters as the groundwater samples.

3. Field Screening

Soil sample field screening results ranged from 0.0 to 589 instrument units (IUs) (Table 1). The highest field screening readings occurred in boring SB-10, located approximately fifty feet west of the former tank location.

C. Analytical Results

1. Soil Sample Results of December 1992 Drilling Event

Soil samples submitted for laboratory analysis from soil borings SB-10/MW-1C, SB-11/MW-7, SB-12/MW-8, SB-13/MW-9 and SB-14/MW-10 were analyzed for GRO, PVOC and lead. See Table 2 and Appendix C for analytical results.

906519.TBL SOILS1

MTBE = Methyl Tertiary Butyl Ether
GRO = Gasoline Range Organics
TMB = Trimethylbenzene

Analytical results for the soil sample from SB-10 at 7 to 9 feet bgs indicated GRO at 92 parts per million (ppm) and the following PVOC constituents: benzene at 0.4 ppm, ethylbenzene at 4.0 ppm, methyl-tert-butyl-ether (MTBE) at 0.4 ppm, toluene at 2.7 ppm, 1,2,4-trimethylbenzene at 7.1 ppm, 1,3,5-trimethylbenzene at 2.1 ppm and total xylenes at 15 ppm. Lead was detected at 8.0 ppm.

Results for the soil sample from SB-10 at 11 to 13 feet bgs indicated GRO was below the laboratory detection limit of 5.0 ppm (< 5.0 ppm). Only one PVOC constituent, benzene at 0.2 ppm, was detected above the laboratory detection limit of 0.1 ppm. Ethylbenzene, MTBE, toluene, 1,2,4-trimethylbenzene and 1,3,5-trimethylbenzene were all below the laboratory detection limit of 0.1 ppm, and total xylenes were below the laboratory detection limit of 0.3 ppm. Lead was detected at 7.0 ppm.

Analytical results for both samples from soil boring SB-11 (7 to 9 feet bgs and 11 to 13 feet bgs) indicated GRO and all PVOC constituents were below laboratory detection limits. However, lead was detected in both samples at 8.0 ppm.

Analytical results for both samples from soil boring SB-12 (7 to 9 feet bgs and 11 to 13 feet bgs) indicated GRO and all PVOC constituents to be below laboratory detection limits. However, lead was detected in the 7 to 9 feet bgs sample at 46.0 ppm and in the 11 to 13 feet bgs sample at 8.0 ppm.

The results for both samples from soil boring SB-13 (3 to 5 feet bgs and 13 to 15 feet bgs) indicated GRO and all PVOC constituents were below laboratory detection limits. Lead was detected in the 3 to 5 feet bgs sample at 10.0 ppm and in the 13 to 15 feet bgs sample at 8.0 ppm.

Analytical results for both samples from soil boring SB-14 (9 to 11 feet bgs and 13 to 15 feet bgs) indicated GRO and all PVOC constituents were below laboratory detection limits. Lead was detected in the 9 to 11 feet bgs sample at 7.0 ppm and in the 13 to 15 feet bgs sample at 8.0 ppm.

The WDNR cleanup guidance was 10 ppm GRO; however, cleanup standards, NR 720, are currently being promulgated. As of February 15, 1994, the cleanup levels being developed had levels for BTEX, 1,2-dichloroethane and lead, in addition to GRO. The standards are 5.5, 1,500, 2,900, 4,100 and 4.9 ppb for BTEX and 1,2-dichloroethane, and

500 ppm for lead in an industrial area. Exceedances occur in SB-10 from 7 to 9 feet bgs for the four BTEX compounds and from 11 to 13 feet bgs for benzene.

2. Groundwater Results

a. Results of the November, 1992 Groundwater Sampling Event

Groundwater samples submitted for laboratory analysis from monitoring wells MW-1A, MW-2A, MW-3A, MW-4, MW-5 and MW-6 were analyzed for GRO and volatile organic compounds (VOC) (Table 3 and Appendix B).

Analytical results for the groundwater samples from MW-1A indicated GRO at 100 parts per billion (ppb). Four VOC constituents were detected above laboratory detection limits: cis-1,2-dichloroethene at 260.0 ppb, which is above the WDNR Enforcement Standard (ES) of 70 ppb; trans-1,2-dichloroethene at 10.0 ppb, which is below the WDNR Preventive Action Limit (PAL); trichloroethene at 96.0 ppb, which is above the WDNR ES of 5.0 ppb; and vinyl chloride at 120.0 ppb, which is above the WDNR ES of 0.2 ppb.

Results for MW-2A indicated GRO at 53,000 ppb, and detects of eight VOC constituents: n-butylbenzene at 180 ppb (no current standard); ethylbenzene at 7,200 ppb (above the ES of 700 ppb); isopropylbenzene at 110 ppb (no current standard), naphthalene at 1,400 ppb (above the ES of 40 ppb); toluene at 2,800 ppb (above the ES of 343 ppb); 1,2,4-trimethylbenzene at 810 ppb (no current standard); 1,3,5-trimethylbenzene at 440 ppb (no current standard); and total xylenes at 25,000 ppb (above the ES of 620 ppb).

Analytical results for wells MW-3, MW-4 and MW-6 indicated there were no detects of GRO or VOCs in samples from these three wells.

Results for MW-5 indicated six detects of VOC constituents: 1,1-dichloroethane at 2.9 ppb (below the PAL of 85 ppb); 1,1-dichloroethene at 1.3 ppb (above the PAL of 0.7 ppb); cis-1,2-dichloroethene at 8.4 ppb (above the PAL of 7.0 ppb); trans-1,2-dichloroethene at 1.9 ppb (below the PALof 20 ppb); trichloroethene at 56 ppb (above the ES of 5.0 ppb); and vinyl chloride at 26 ppb (above the ES of 0.2 ppb).

b. Results of December, 1992 and January, 1993 Sampling Event of Wells Installed in December, 1992

Groundwater samples submitted for laboratory analysis from monitoring wells MW-1P, MW-1C, MW-7, MW-8, MW-9 and MW-10 were analyzed for GRO, VOCs and lead (Table 3 and Appendix E).

Analytical results for groundwater samples from MW-1P, MW-8 and MW-9 all indicated there were no detects of GRO, VOCs, or lead from any of these wells.

Results of MW-1C indicated GRO at 1,700 ppb and detects of twelve VOC constituents. The detected VOCs are as follows: benzene at 120 ppb (above the ES of 5.0 ppb); chloroform at 36 ppb (above the ES of 6.0 ppb); cis-1,2-dichloroethene at 460 ppb (above the ES of 70 ppb); naphthalene at 20 ppb (above the PAL of 8 ppb); toluene at 110 ppb (above the PAL of 68.6 ppb); trichloroethene at 560 ppb (above the ES of 5.0 ppb); vinyl chloride at 810 ppb (above the ES of 0.2 ppb); and total xylenes at 310 ppb (above the PAL of 124 ppb). Lead was below laboratory detection limits.

Analytical results of MW-7 indicated there were no detects of GRO or lead and only one detect of a VOC constituent, naphthalene at 2.4 ppb (which is below the PAL of 8 ppb).

Results of MW-10 indicated one detect of a VOC constituent, toluene at 1.2 ppb (which is below the PAL of 69 ppb), and no detects of GRO or lead.

c. Results of October and November, 1993 Confirmation Sampling Event at All Wells

Groundwater samples submitted for laboratory analyses for this sampling event included samples from MW-1, MW-1P, MW-1C and MW-2 through MW-10. Samples for these wells were analyzed for GRO, PVOC and specific VOC compounds detected in previous sampling events as shown in Table 3 and Appendix E.

The results of MW-1 indicated GRO at 140 ppb and the detection of seven VOC constituents: benzene at 1.5 ppb (above the PAL of 0.5 ppb); cis-1,2-dichloroethene at 330 ppb (above the ES of 70 ppb); trans-1,2-dichloroethene at 18 ppb (below the PAL); ethylbenzene at 1.3 (below the PAL of 140 ppb); toluene at 1.3 ppb (below the PALof 68.6

ppb); trichloroethene at 120 ppb (above the ES of 5 ppb); and vinyl chloride at 150 ppb (above the ES of 0.2 ppb).

Analytical results for MW-1C indicated a detect of GRO at 1,600 ppb, and eleven detects of VOC constituents: benzene at 160 ppb (above the ES of 5 ppb); cis-1,2-dichloroethene at 740 ppb (above the ES of 70 ppb); trans-1,2-dichloroethene at 30 ppb (above the PAL of 20 ppb); ethylbenzene at 240 ppb (above the PAL of 140 ppb), naphthalene at 11 ppb (above the PAL of 8 ppb); toluene at 72 ppb (above the PAL of 68.6 ppb); trichloroethene at 380 ppb (above the ES of 5 ppb); 1,2,4-trimethylbenzene at 17 ppb (no current standard); 1,3,5-trimethylbenzene at 5 ppb (no current standard); vinyl chloride at 870 ppb (above the ES of 0.2 ppb); and total xylenes at 600 ppb (above the PAL of 124 ppb).

Results for MW-2 indicated GRO at 36,000 ppb and seven detects of VOC constituents: benzene at 15 ppb (above the ES of 5 ppb); ethylbenzene at 5,500 ppb (above the ES of 700 ppb); naphthalene at 770 ppb (above the ES of 40 ppb); toluene at 710 ppb (above the ES of 343 ppb); 1,2,4-trimethylbenzene at 850 ppb (no current standard); 1,3,5-trimethylbenzene at 190 ppb (no current standard); and total xylenes at 22,000 ppb (above the ES of 620 ppb).

Analytical results for MW-5 indicated there were no detects of GRO or lead and three detects of VOC constituents: 1,1-dichloroethane at 2.0 ppb (below the PAL of 85 ppb); cis-1,2-dichloroethene at 9.1 ppb (below the PAL); and trichloroethene at 34 ppb (above the ES of 5 ppb).

The analytical results for wells MW-1P, MW-3, MW-4 and MW-6 through MW-10 all indicated there were no detects of GRO, VOCs or lead from any of these wells.

D. Discussion of Continued Investigation Results

1. Extent of Soil Contamination

Based on laboratory results for this phase of investigation, petroleum related soil contamination exceeding WDNR regulatory limits were detected only in SB-10/MW-1C. Soil boring SB-10/MW-1C is located adjacent to the former tank location to the southwest, within the previously determined, limited area for extent of gasoline contaminated soil, as illustrated on Figure 5.

FIGURE 5

2. Extent of Groundwater Contamination

Based on laboratory results, the extent of petroleum related groundwater contamination is illustrated in Figure 6. Groundwater samples from three monitoring wells, MW-1, MW-1C and MW-2, indicated detects of petroleum related contamination exceeding WDNR regulatory limits. Other various VOCs were also detected in these wells and in MW-5; however, these VOCs are probably not related to the use of the former petroleum tank system. Table 3 summarizes the analytical results of groundwater samples from all the monitoring wells.

E. Difficulties Encountered

On December 17, 1992 when GAS personnel were on site to develop monitoring wells MW-8, MW-9 and MW-1P1 the wells contained no water. Distilled water was added to the wells to clean out the screened section possibly clogged during installation. Five gallons were added to MW-9 and MW-1P1 and four gallons to MW-8. The wells were surged with a bailer then purged dry. On January 6, 1993 the three wells were checked and all three contained water. Well MW-8 contained 2.5 gallons, MW-9 contained two gallons and MW-1P1 contained 7.5 gallons. The wells were again purged dry. On January 11, 1993 the three wells were checked again and all three wells again had water. The wells were sampled without purging because of the small volumes of water produced by these wells.

Recovery well RW-1 was installed on August 2, 1993. At that time the water level in the well was 25.30 ft below the measuring point on the well (the measuring point is located approximately one foot below grade). The depth to the water table in well MW-2, located 3.5 feet to the east is approximately 2 feet bgs. The upper ten feet of sediment at RW-1 are sands. Accordingly, it was felt that the borehole was "smeared" during drilling; the clays from the bottom 17 feet of the borehole coated the wall of the borehole with a layer of clay as the augers transported the clays to the surface.

Based on recommendations made by WDNR personnel, arrangements were made to continue well development utilizing dry ice as a source of gas to pressurize the well. It was felt that the gas pressure would disperse the smeared clay on the borehole wall. On August 24, the well was pressurized to 40 psi and allowed to degas slowly. The well was pressurized to 60 psi and again allowed to de-gas slowly. On August 26, 1993, the hydraulic conductivity of the well was estimated at 9.8 E-5 ft/min. The hydraulic

FIGURE 6

conductivity increased by a factor of ten over the previous measurement. On September 8, 1993, the well was surged for one hour, bailed down and the recovery recorded. The hydraulic conductivity was subsequently estimated at 1.4 E-5 ft/min.

On October 5, 1993, the recovery well was bailed and the recovery recorded. The hydraulic conductivity was estimated at 8.7 E-6 ft/min. The conductivity had decreased by a factor of almost two. On October 6, 1993 the well was again bailed down in an attempt to develop the fines out of the filter pack and well screen. The hydraulic conductivity was estimated at 9.2 E-6 ft/min, slightly greater than the previous estimate (Appendix F).

III. FEASIBILITY TESTING

A. Methods

1. Biological Testing

On August 2, 1993, GAS personnel were on site to collect soil samples for bioenumeration analysis. As outlined in the GAS Workplan for remedial feasibility testing, six soil samples were collected (Figure 7). Samples were collected from zones of high, medium and low contamination levels. These samples were collected from both of the two general soil textures present at the site (clayey and sandy soils).

Samples were collected using aseptic techniques recommended by BioRenewal Technologies (Appendix G). Soil samples were placed in sterile four-ounce glass jars and stored on ice. Samples were sent to BioRenewal Technologies, Inc. in Madison, Wisconsin.

On August 18, 1993, GAS personnel were on site to collect groundwater samples for bioenumeration analysis. As outlined in the GAS Workplan for remedial feasibility testing, three groundwater samples were collected (Figure 7) Samples were collected from zones of high, medium and low contamination levels.

Groundwater samples were collected with new, disposable bailers. Two clean, sterile 40-ml VOA vials were collected from each sampled well. Samples were stored on ice and sent to BioRenewal Technologies, Inc. in Madison, Wisconsin.

2. Groundwater Pump Testing

Based on the boring logs for monitoring well MW-2 which indicated that sediments were sandy for approximately the upper ten feet, it was felt that a well screened through the sands would produce appreciable volumes of water. Accordingly, a pump test was planned to determine the potential flow rate and radius of influence. After evaluating the results of the groundwater bail down testing performed in conjunction with recovery well developing by screening level groundwater modeling, groundwater pumping from a single well or series of wells was eliminated as an option for groundwater extraction. The groundwater pump testing was eliminated from the remedial feasibility testing. However, screening level groundwater modeling was used to explore the feasibility of groundwater extraction and remediation using trenches (Figure 8 and Appendix H).

3. Soil Vapor Extraction Testing

The results of the groundwater bail down testing performed in conjunction with recovery well developing were converted to intrinsic permeability. The permeability of the soil was estimated at 1.0 E-10 cm^2 which was considered to be too low, one hundred times lower than the rule of thumb level of 1.0 E-8 cm^2 for soil vapor extraction to be feasible. Based on these results, soil vapor extraction feasibility testing will not be performed nor will soil vapor extraction be a recommended option for soil remediation.

B. Results

1. Biological Testing

The level of heterotrophic microbial populations ranged from 4.4 E 2 to 9.3 E 4 colony forming units per gram dry soil weight (CFU/g_{DSW}) in the soil samples and 2.1 E 4 to 2.0 E 6 colony forming units per milliliter (CFU/ml) in groundwater samples. The percentage of organisms specifically capable of using gasoline as a carbon source, referred to as gasoline degrader organisms, ranged from approximately 7 to 41 percent in soil samples. The percentage of degrader organisms in groundwater samples ranged from 5 to 25 percent (Table 4). BioRenewal Technology concluded that there were viable populations of organisms in the soil and groundwater, but the population levels were low. Also, the site was atypical in that the microbial population levels were higher in the groundwater than in the soil.

908519.TBL.MICROBIO

The results of the nutrient analysis on the soil and groundwater samples were indicative of limited levels of nutrients present at the site. The level of total Kjeldahl nitrogen ranged from 232 to 284 ppm in the clayey sediments and from 90 to 144 ppm in the sandy sediments. While the level of ammonium nitrogen ranged from 1.0 to 3.0 ppm in the clayey sediments and from 2.0 to 5.5 ppm in the sandy sediments. The level of phosphate ranged from 2.0 to 3.0 ppm in the clayey sediments and from 1.0 to 2.0 ppm in the sandy sediments. The level of magnesium ranged from 290 to 340 ppm in the clayey sediments and from 80 to 200 ppm in the sandy sediments. The level of calcium ranged from 3,750 to 4,100 ppm in the clayey sediments and from 3,500 to 7,000 ppm in the sandy sediments. The cation exchange capacity ranged from 22 to 23 ppm in the clayey sediments and from 19 to 36 ppm in the sandy sediments (Appendix G).

The results of the nutrient testing were analyzed by BioRenewal Technologies and it was their conclusion that the potassium, magnesium, calcium and cation exchange capacity levels of the samples were in the range considered to be adequate for microbial growth. However, the levels of nitrogen and phosphorous were considered to be "marginally adequate." Dissolved oxygen levels in site groundwater were measured on March 4 and 7, 1994. Levels ranged from 0.0 to 10.6 mg/L (Table 5).

2. Groundwater Trenching and Pumping

The results of screening level groundwater modeling were indicative of a low flow situation. The recovery well RW-1 was dewatered by a pump rate of 0.06 gallons per minute (gpm) after 24 hours. Analysis of the effects of pumping from a system of trenches, which would be excavated to a depth of twelve feet bgs, indicated that the trenches would capture the known extent of petroleum contamination (Figure 8). A recovery well near MW-1A would extract the deeper GRO contamination at the 20-30 feet bgs interval.

IV. DISCUSSION

Excavation of accessible site soils does not address soil contamination that is inferred to exist under the building immediately north of MW-2 or detected on soil samples collected under the sidewalks during the initial tank abandonment assessment and inferred to occur below 66th Street and National Avenue. It is not feasible to excavate below these streets because of the costs of street removal and restoration. There are also several utilities that pass through streets adjacent to the affected area. Similarly, the area of the

loading dock between MW-2 and the former tank location is crossed by a gas line and a sewer.

The estimated permeability of the site soils, based on the data from RW-1, is too low for soil vapor extraction to be feasible. Therefore, the method was not pilot-tested nor can it be recommended as a viable alternative. Similarly, groundwater pump and treat from a single well or a series of wells cannot be recommended. The number of wells and connecting trenches would be too numerous.

The WDNR guidance document on bioremediation describes the following requirements for bioremediation of soil: maximum contaminant level should be less than 500 ppm GRO; moisture content should be between 25 to 85 percent of the water holding capacity of the soil; permeability should be greater than 1 E-3, but permeabilities in the range of 1 E-5 to 1 E-3 cm/sec are acceptable if other conditions are appropriate; pH should be in the range of 5 to 9; dissolved oxygen (DO) in soil moisture should be greater than 0.2 ppm and is considered rate limiting at less than one ppm; the redox potential of the soil should be greater than 100 mV (oxidizing conditions); the ratio of total carbon to nitrogen should be less than 35 and preferably less than 25; and the ratio of total carbon to phosphorous should be less than 120.

The site meets several of the requirements. The levels of residual petroleum detected in various samples collected on site were 24 to 242 ppm total petroleum hydrocarbons (TPH) from five feet into the tank excavation walls, 550 ppm TPH in the borehole for MW-2, 470 ppm TPH in SB-4, and 92 ppm GRO in SB-10. Only one sample exceeded the 500 ppm limit and the exceedence was only 10 percent. The level of soil moisture in all six soil samples was within the specified range.

The site does not meet several of these requirements. The hydraulic conductivity measured in the recovery well had a geometric mean of 8 E-6 cm/sec, which falls just outside the acceptable range. However, analyses of the grain size distribution of the three sandy soils resulted in characterizations as sandy loams, which would be expected to have hydraulic conductivities significantly higher than 8 E-6 cm/sec. The residual soil contamination at the site is expected to occur within the sandy fill material along the building and utility trenches under the loading dock. The level of DO in groundwater from areas of soil contamination as measured at MW-2 and MW-1C were less than the rate limiting level and minimum level. Groundwater at MW-2 had 0.1 ppm DO, which is less

than the 0.2 ppm limit. A groundwater sample from RW-2, which is three feet west of MW-2, had the highest bacterial enumeration, which may explain the lack of DO. Groundwater at MW-1C had 0.0 ppm DO, which should prevent the growth of aerobic organisms. MW-1C had one-tenth the level of CFUs that RW-1 had one-fortieth the CFUs of degraders at RW-1.

The area of highest contamination had adequate biological activity for passive remediation of soil contamination to be feasible. When the groundwater recovery trench system is implemented, groundwater from outside the impacted area will be drawn in to the soil contamination plume. This water should have higher levels of oxygen and nutrients than the groundwater within the plume. The result should be an increase in the biological activity with an increased degradation rate. The effectiveness of the biological degradation can be assessed after one year to determine if oxygen and nutrient additions are necessary for soil clean-up to proceed at a reasonable rate.

The contaminated site groundwater can be captured using a system of trenches for the shallow contamination and a recovery well adjacent to the MW-1 well nest to recover the deep contamination. Recovery trenches will have a larger seepage area in comparison to wells. The trenches will be constructed so that only one sump will be needed to drain the trench system, thus reducing the equipment cost in comparison to multiple wells.

V. RECOMMENDATIONS

Based on geological and analytical data obtained from the feasibility testing, GAS recommends implementation of the Remedial Action Plan of groundwater extraction and remediation utilizing trenches. Analysis of the feasibility test data indicated the trenches would capture the known extent of petroleum contaminated water. The water within the trenches will then be extracted via a recovery sump and discharged into the sewer or contained and treated. As contaminated water flows into the trenches and pumped out, fresh water will flow into the area, replacing the contaminated water. The fresh water entering the area should enhance the soils with higher levels of nutrients and dissolved oxygen, which would increase the microbial population and the rate of bioremediation of the soils.

Passive soil bioremediation and groundwater recovery will require monitoring as they proceed. As monitoring data is collected, necessary modifications will be taken, such as

addition of nutrients or dissolved oxygen. Similarly, the groundwater recovery system will be modified as required. The recovery sump pumping system could be shut down and recovery trench could be used to infiltrate nutrients.

Upon approval of the remedial action plan, specifications for the groundwater recovery system will be developed. The specifications will be incorporated within a bid document that will be used to obtain competitive bids from remedial contractors.

WATER SAMPLING LOG

Graef Anhalt Schloemer & Associates Inc.

(414) 259-1500

PROJECT: Pressed Steel PROJ. NO.: 908519 DATE: 11/10/92

LOCATION: West Allis

WELL NO.: MW-1A TIME SAMPLING BEGAN: 9:10 AM

WEATHER: 45° rainy TIME COMPLETED: 11:25 AM

SAMPLING PERSONNEL: Tony Srok

EVACUATION DATA

Description of Measuring Point (MP):	NTOC	MP Elevation:	731.21 ft. MSL
Height of MP Above/Below Land Surface:	3 ft.	Water-Level Elevation:	723.23 ft. MSL
Total Depth of Well Below MP:	34.18 ft.	Diameter of Casing:	2.03 in.
Depth to Water Below MP:	7.98 ft.	Gallons Pumped/Bailed	
Water Column in Well:	26.2 ft.	Prior to Sampling:	9 gal.
Vol. of Water in ~~Filter Pack &~~ Well per Foot:	0.1616 gal.	Sampling Pump Intake Setting	
Vol. of Water in ~~Filter Pack &~~ Well:	4.23 gal.	(Ft. below land surface):	N/A ft.

Evacuation Method: Modified disposable polyethylene Bailer

SAMPLING DATA FIELD PARAMETERS

Color: Light Brown Appearance: Slightly turbid

Odor: None Temperature: 52 °F

Other (specific ion; OVA; HNU; etc.) ---

Specific Conductance, umhos/cm: 5500 pH: 10.7

Sampling Method & Material: Modified disposable polyethylene bailer

Constituents Sampled	Container Description	Preservative(s)
GRO/VOC	(4) 40 ml VOA vials	HCL & ice

Recharge: Poor. Purged dry at 9 gallons

Remarks: Stick-up leaning east. Bailer shortened to 6 inches so it would fit around bend in well casing

Color: Clear Appearance: Clear

Odor: None Temperature: 52 °F

Other (specific ion; OVA; HNU; etc.) ---

Specific Conductance, umhos/cm: >19,900 pH: 2.9

Sampling Method & Material: Disposable polyethylene bailer

Constituents Sampled	Container Description	Preservative(s)
GRO/VOC	(4) 40 ml VOA vials	HCL & ice

Recharge: Poor

Remarks: Bailed dry at 3.5 gallons

WATER SAMPLING LOG

Graef Anhalt Schloemer & Associates Inc.

(414) 259-1500

PROJECT: Pressed Steel PROJ. NO.: 908519 DATE: 11/9/92

LOCATION: West Allis

WELL NO.: MW-6 TIME SAMPLING BEGAN: 1:05 PM

WEATHER: 47° cloudy TIME COMPLETED: 1:35 PM

SAMPLING PERSONNEL: Tony Srok

EVACUATION DATA

Description of Measuring Point (MP):	NTOC	MP Elevation:	727.24 ft. MSL
Height of MP Above/Below Land Surface:	0.40 ft.	Water-Level Elevation:	721.27 ft. MSL
Total Depth of Well Below MP:	17.86 ft.	Diameter of Casing:	2.03 in.
Depth to Water Below MP:	5.97 ft.	Gallons Pumped/Bailed	
Water Column in Well:	11.89 ft.	Prior to Sampling:	6.0 gal.
Vol. of Water in ~~Filter Pack &~~ Well per Foot:	0.1616 gal.	Sampling Pump Intake Setting	
Vol. of Water in ~~Filter Pack &~~ Well:	1.92 gal.	(Ft. below land surface):	N/A ft.

Evacuation Method: Disposable polyethylene Bailer

SAMPLING DATA FIELD PARAMETERS

Color: Gray Appearance: Slightly turbid, fine sediments, gray

Odor: None Temperature: 52 °F

Other (specific ion; OVA; HNU; etc.) ---

Specific Conductance, umhos/cm: 700 pH: 8.2

Sampling Method & Material: Disposable polyethylene bailer

Constituents Sampled	Container Description	Preservative(s)
GRO/VOC	(4) 40 ml VOA vials	HCL & ice

Recharge: Poor

Remarks: Bailed dry at 6 gallons

12. Sediment in well bottom	inches	inches
13. Water clarity	Clear [ ] 10 Turbid [ ] 15 (Describe)	Clear [ ] 20 Turbid [ ] 25 (Describe)

Fill in if drilling fluids were used and well is at solid waste facility:

14. Total suspended solids	mg/l	mg/l
15. COD	mg/l	mg/l

Additional comments on development:

On 12/17/92 no water was present. As instructed, 5 gallons of distilled water was added to the well and then purged and bailed dry. All 5 gallons were recovered. No sign of recharge in well 1/2 hour after bailed dry. On 1/6/93 water was present in the piezometer and 7.5 gallons were removed until bailed dry. On 1/11/93 there was 6.64 feet of water in the piezometer so 1.5 gallons was purged out and the piezometer sampled.

12. Sediment in well bottom	inches	inches
13. Water clarity	Clear [ ] 10 Turbid [ ] 15 (Describe)	Clear [ ] 20 Turbid [ ] 25 (Describe)

Fill in if drilling fluids were used and well is at solid waste facility:

14. Total suspended solids	mg/l	mg/l
15. COD	mg/l	mg/l

Additional comments on development:

On 12/17/92 no water was present. As instructed, 4 gallons of distilled water was added to the well and then purged and bailed dry. Only 3 of the 4 gallons were recovered. On 1/6/93 water was detected in the well and 2.5 gallons were removed until bailed dry. On 1/11/93 there was 2.12 feet of water in the well so it was sampled without purging.

On 08/02/93 the water was 24 feet lower than expected. On 08/16/93 50 gallons of west allis tap water was added and the well was surged. The well was pressurised with CO_2 on 08/24/93 and 08/26/93. The well was surged on 09/08/93, 10/05/93, 10/06/93, 10/19/93 and10/21/93

RE: NET Job 91.0888

Dear Mr. Parish:

At your request, I have reviewed the result reported for NET sample 26909 for cis-1,2-Dichloroethene. The reported result of 28,000 ug/L was too high by a factor of 100. The correct result was 280 ug/L.

If you have any further questions regarding this information, please feel free to contact me.

Sincerely,

Paul P. Junio
QA Coordinator

Sample Collector(s): Ron Gr		
Property Owner: Pressed Steel Tank	Property Address	Telephone Number (include area code)

I hereby certify that I received, properly handled, and disposed of these samples as noted below:

Relinquished By (Signature): Ron Gr	Date/Time/Temp.: 11-5-93 8:40	Received By (Signature): [illegible] #259
Relinquished By (Signature)	Date/Time/Temp.: 11-5-93 9:35	Received By (Signature): Karrie Kaus
Relinquished By (Signature)	Date/Time/Temp.	Received for Laboratory By (Signature): Karrie Kaus 11/8 14:50

Sample Condition on Receipt by Laboratory
LABORATORY USE ONLY

Temperature of temperature blank: ONIce

Page 1 of 1

If samples were received on ice and there was ice remaining, you may report the temperature as "received on ice." If all of the ice was melted, the temperature of the melt may be substituted for a temperature blank.

Field ID Number[1]	Date Collected	Time Collected	Sample Type[2]	Sample Device[3]	Preserv. Type	Field Screening	Description	Analysis Type	Lab ID Number	No./Type of Containers	Cracked /Broken	Improperly Sealed	Good Condition	Other Comments
MW-1	11/3/93	1:15	Ground Water	Bailer	HCL		Monitoring Well MW-1	- GRO + BVOC - cis-1,2-Dichloroethene - trans-1,2-Dichloroethene - Trichloroethene - Vinyl Chloride		(5) 40-ml VOA Vials				

[1]Sample description must clearly correlate the sample ID to the sampling location shown on a map.
[2]Specify groundwater, surface water, soil, leachate, sludge, etc.
[3]Type of sampling devis; split spoon, hand auger, metal spatula, soil syringe, etc.

Remarks: _____

Report Results to: Geoffrey Parish

DEPARTMENT USE/OPTIONAL FOR SOIL SAMPLERS

Disposition of unused portion of sample
Laboratory should:
☐ Dispose ☐ Retain for ____ days
☐ Return ☐ Other

DEPARTMENT USE ONLY

Split samples: Offered? ☐ Yes ☐ No (Check one)
Accepted? ☐ Yes ☐ No (Check one)

Re: Summary of bioremediation evaluation results and conclusions
Pressed Steel Tank, West Allis, WI

Dear Geof:

I am pleased to submit this brief letter report summarizing results and conclusions from our analysis of the six soil and three groundwater samples submitted by Graef, Anhalt, Schloemer & Associates (GAS) to Biorenewal Technologies, Inc. (BTI) in connection with the Pressed Steel Tank site located in West Allis, Wisconsin (GAS Project # 908519). We understand the principal contaminants under investigation at this site are gasoline-related hydrocarbons.

Background

The six soil samples, designated SS-1 through SS-6 were collected on August 2, 1993. The three groundwater samples, designated "RW-1", "MW-1C" and "MW-10", were taken by GAS on August 18, 1993. All samples were delivered to BTI laboratories on the day after sampling and were maintained under refrigeration, on ice.

Methodology

For this project, comparative enumeration assays were carried out to provide information about the indigenous microbial populations existing in the samples obtained from the site. Specifically the assay enumerates:

- The total heterotrophic population capable of utilizing complex carbon sources.
- The "degrader" population capable of utilizing hydrocarbons (gasoline) as a sole carbon source.

A complete low-nutrient media, specifically designed for recovery of damaged or stressed organisms was used to determine the total heterotrophic populations present. For purposes of this report, the "degrader" population is the microbial population capable of utilizing gasoline - - the contaminant of interest at this site. Degrader populations were enumerated using a defined minimal media containing the required macro and micro-nutrients plus gasoline as a sole source of carbon at 1.0% v/v final concentration.

Upon receipt, the samples submitted for microbial enumeration were subjected to a preliminary range-finding experiment to assure that the dilutions selected for the replicated plating would fall within a countable range. Following this, a total of five replicates were plated from each of two selected serial dilutions and plated on the above two types of media. Incubation of the samples was carried out at 22° C. All samples were incubated under aerobic conditions.

Aliquots from each sample were sent to the University of Wisconsin Soil and Plant Analysis Laboratory. Parameters evaluated for groundwater sample "MW-10" were total Kjeldahl nitrogen, nitrogen as ammonium, potassium, ortho-phosphate, and pH. All six soil samples submitted were also evaluated for the above parameters in addition to percent organic matter, cation exchange capacity, percent water holding capacity and sand, silt and clay content. Overall, these parameters provide the most relevant information about basic nutrient levels for biological systems and other physio-chemical factors important in evaluating a bioremediation cleanup strategy. A summary of procedures used by the UW Soils Lab is attached.

Microbial Enumeration Results

Heterotrophic microbial populations in the subsurface range from 1×10^3 to 1×10^8 cfu/g_{DSW} (colony forming units per gram of dry soil weight). Typically, groundwater populations are found to be one to two magnitudes lower (i.e. 1×10^2 to 1×10^6 colony forming units per milliliter) than those found in soil. Degrader populations greater than 1×10^3 cfu/g_{DSW} or 1×10^2 cfu/ml are generally considered to indicate a population sufficient for considering a biologically based clean-up strategy. However, populations on the low end of this range (i.e., $\approx 1 \times 10^3$ cfu/ml in groundwater or 1×10^4cfu/g_{DSW} in soil) are more usefully thought of as being potential inoculum which can, with proper management of site conditions, be increased to levels capable of supporting sufficient metabolic activity to attain biodegradation of site contaminants. Significant, timely biodegradation of contaminants does not generally occur until the populations are above 1×10^6 cfu/g_{DSW}, or 1×10^6 cfu/ml in groundwater

The attached microbial enumeration results reveal low levels of viable heterotrophic populations in the majority of the soil samples analyzed. Sample "SS-5" was found to contain 9.3×10^4 cfu/g_{DSW}, the highest population found in the soil samples analyzed. Of the three groundwater samples analyzed, sample "RW-1" had the highest total heterotrophic populations observed in any of the groundwater samples, 2.0×10^6 cfu/ml.

Microbial populations capable of utilizing gasoline are present in the majority of the samples analyzed. In general, the groundwater samples contained the highest microbial degrader populations found in any of the samples, soil or groundwater. However, the degrader populations were found to be very low in all the soil samples tested. Soil sample "SS-5" and groundwater sample "RW-1" exhibited the highest degrader populations, 3.1×10^3 cfu/g_{DSW} and 4.9×10^5 cfu/ml, respectively.

Nutrient and Physio-chemical Analysis Results

Results of the nutrient analysis are attached. Of the macro nutrients essential to support healthy microbial populations, nitrogen is considered among the most important. Next to oxygen,

nitrogen is typically the nutrient found in potentially limiting amounts in the subsurface. Available nitrogen, in the form of ammonium (NH_4^+), nitrate (NO_3^-) and nitrite (NO_2^-), is considered easily utilized by microorganisms and is principally incorporated into cellular protein, nucleic acids and coenzymes.

In soils, depending on soil type and chemistry, available nitrogen (e.g. ammonium nitrogen) is likely to be limiting at concentrations below five mg/kg_{DSW} of soil (dry weight). To assure non-limiting conditions, available nitrogen levels in the 10 to 20 mg/kg_{DSW} range are desirable in soil to adequately support active degrading microbial populations over the duration of remedial treatment. In groundwater, nutrients are typically more uniformly available and biologically accessible than in soil matrices due to spatial proximity and enhanced mass transfer rates. As a result, lower concentrations of available nitrogen can adequately support actively degrading microbial populations in groundwater. While a definitive cutoff has not been established, levels on the order of one mg/l or above can generally be considered adequate for support of microbial activity in groundwater.

In the soil samples analyzed, the total Kjeldahl nitrogen analysis indicated concentrations ranged from 284 mg/kg_{DSW} to 90 mg/kg_{DSW}. Available ammonium nitrogen concentrations varied from 1.0 mg/kg_{DSW} in sample "SS-3" to 5.5 mg/kg_{DSW} in sample "SS-5", which also had the greatest population levels of the soil samples tested.

The total Kjeldahl nitrogen and available ammonium nitrogen concentrations for the groundwater sample "MW-10", the only groundwater sample analyzed for nutrients, were 5.5 ppm and < 0.5 ppm, respectively.

Concentrations of ortho-phosphate of approximately five mg/kg_{DSW} of soil are generally considered adequate to support microbial utilization. For the same reasons listed above, lower concentrations of ortho-phosphate are required in groundwater than soil. The concentrations of ortho-phosphate found in the soil samples ranged from 1.0 mg/kg_{DSW} in sample "SS-6" to 3.0 in sample "SS-1. Groundwater sample "MW-10" contained a 0.1 ppm concentration of ortho-phosphate.

These levels of easily available nitrogen and phosphorus are, at best, marginally adequate to support actively growing microbial populations. These parameters should be more closely examined if a biological remediation approach is selected.

The pH of all the soil samples analyzed were found to be on the alkaline side of the typical acceptable physiological range for microbial activity (5.5 to 9.0). It does not appear that there is any correlation between assessed microbial population levels in soil samples having a lesser pH, in comparison to those samples exhibiting a more alkaline pH. This would suggest that the microbial populations have adapted to the current soil pH conditions.

Other physical parameters analyzed were found to have values considered to be adequate for microbial habitation and thus, are not likely to be currently limiting factors. Oxygen availability and other metals (e.g. iron, aluminum) were not analyzed as part of this scope of work.

Findings and Conclusions

Microbial Factors

- The majority of the soil samples analyzed revealed low levels of viable heterotrophic microbial populations. Atypically, the three groundwater samples analyzed had higher levels of microorganisms, both total heterotrophic and degrader populations, than were found in the soil samples.
- Microbial populations capable of utilizing weathered gasoline as a sole carbon source were found to exist in the majority (8 out of 9) of the samples analyzed. However, only one, groundwater sample RW-1, had populations greater than 1.0×10^5 cfu/g_{DSW}; a level generally considered to be a moderate population.

Nutrient and Physio-chemical Factors

- Concentrations of easily available ammonium nitrogen were found to be, at best, marginally adequate in five of the six soil samples analyzed as well as in the groundwater sample tested. A strong correlation between this nutrient and the microbial population levels found in the samples was not evident. Nitrogen may potentially become a biologically limiting factor over the duration of the remedial treatment period and should be periodically monitored.
- Concentrations of available phosphorus found in all of the soil samples and the groundwater sample appear to be marginally adequate for widespread biological activity.
- Soil pH, although trending toward the alkaline side of optimum, is in all likelihood, not a major limiting factor at this site.
- Results for other soil parameters analyzed were within the ranges considered suitable to support diverse microbial populations and associated biological degradation activity.
- No one parameter analyzed was able to be correlated strongly with heterotrophic or degrader population levels.

While exact rates of degradation cannot be predicted from this data, natural attenuation of contaminants is likely to be occurring to some degree, albeit slowly due to the generally low degrader population levels present. The nutrient and physio-chemical conditions in the soil appear to be quite variable in the samples analyzed, and in many instances, marginal for support of large microbial populations. To enhance conditions required for long-term maintenance of degrader populations, further evaluation of *in situ* biological degradation potential in the contaminated zone should include consideration of a strategy to enhance oxygen availability to the subsurface, monitoring of contaminant disappearance, microbial degrader populations, and nutrient levels over time.

Limitations of Assessment

Our assessment was carried out using the skill and degree of care ordinarily exercised by professional consultants practicing in this or similar localities. No other warranty or guarantee, expressed or implied, is made as to the conclusions and professional advice included in this report.

The findings of this report are valid as of the present date of the assessment. However, changes in the conditions of a property can occur with the passage of time, whether due to natural processes or the works of man, on this or adjacent properties. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside control of BTI. This report was generated based on information and results for this specific site and the conclusions drawn are not suitable for use with other applications or at other sites.

* * * * *

We have enjoyed this opportunity to serve you in connection with this investigation. Please contact me or Ms Lynn Haugh if you wish to further discuss these results or have any questions. Thank you for retaining BTI for this project. We look forward to working with you further in the future.

Sincerely,

Alan D. Bettermann
Vice President

ENVIRONMENTAL DIVISION
SITE SAFETY INFORMATION SHEET

LOCAL EMERGENCY NUMBERS:

Police: 9-1-1

Fire Department: 9-1-1

Utilities: **Gas:** Wisconsin Gas Company 291-9399

Electric: Wisconsin Electic Power Company 221-3700

Water: West Allis Water Department 256-8328 7:00 AM - 3:30 PM
After hours call West Allis Police at 476-7531

Nearest phone: Car phone required on site

Nearest Hospital: West Allis Memorial Hospital 546-6111

Directions to Hospital: 8901 West Lincoln Avenue, West Allis
Proceed approximately 1 mile west on National Avenue to 84th Street. Turn left on 84th Street. Proceed approximately 1/2 mile south to Lincoln Avenue. Turn right on Lincoln Avenue. Proceed 4 blocks west on Lincoln Avenue to 88th Street. Turn left on 88th Street. Proceed 1/2 block south to emergency entrance to the hospital which is on the west side of 88th Street.

Prioritized List of People to Contact in Case of Emergency:

(1) Project Manager - Geoffrey Parish **Phone:** (414) 256-4060/1-800-279-0345

(2) Linda Glavan **Phone:** (414) 256-4060/1-800-279-0345

(3) Larry Boyer **Phone:** 414) 256-4060/1-800-279-0345

(4) Bassem Haddad **Phone:** LFB (cp) 414-881-6067 (h) 414-668-8017

Have the Site Safety Plan in hand and expect to answer these questions in the event of an emergency:

Your Name?

Phone number where you can be contacted:

Your exact location and where to enter the site: 1445 South 66th Street. Enter site from 66th Street.

What happened (nature of emergency)?

accident	*personal injury*
fire	*explosion*
gas leak	*other*

If personal injury occured, give:

Name(s)? Location(s)? Condition(s) - age and vital signs, if receiving medical attention -- by whom, etc? Are there chemical or physical hazards that impair rescue operations (see 2nd page - "Anticipated Dangers & Potential Hazards") Is anyone missing?

Anticipated Dangers and Potential Hazards:

Airbourne Express:
- Benzene
- Ethylbenzene
- Toluene
- Xylene

While Sampling:
- Handling Methanol
- Handling Hydrochloric Acid
- Handling Nitric Acid

In Case of Media Involvement:

Please do not release any information. We cannot release information about the job without clearing it with the client first. Field personnel should recommend that the media contact the client and police and fire departments for detailed information.

I have read and understand this Site Safety Plan and its contents:

SITE SAFETY PLAN FOR GAS INVOLVEMENT IN PROJECT

PROJECT NAME: Continued Site Remedial Investigation and Feasibility Study for the Extent of Contamination.

LOCATION: 1445 South 66th Street
West Allis, Wisconsin 53214

INTRODUCTION AND BACKGROUND INFORMATION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was contracted by Pressed Steel Tank, Inc. to complete a Remedial Investigation addressing the subsurface contamination detected during the removal of one 1,000-gallon underground storage tank (UST).

Because contamination was discovered during the tank removal, two sets of soil borings and groundwater monitoring wells were installed. The first round of monitoring wells, MW-1A, MW-2A, and MW-3A, were drilled in April, 1990. A second set of soil borings (SB-4 to SB-8) were installed in May, 1991. Three of these soil borings were converted to monitoring wells (MW-4, MW-5, and MW-6).

GAS has proposed drilling and sampling an additional eight soil borings. Water table monitoring wells will be installed in seven of the soil borings. A piezometer well will be installed in the eighth soil boring. Based on laboratory results from soils and water, one or two recovery wells may be constructed on-site. Water pump tests and vapor extraction are possible for the Remedial Feasibility Study for this site.

GAS on-site activities, and equipment utilized on-site by GAS, will be in accordance with applicable portions of federal, state and local regulations. The health and safety protocols established in this plan are based on the interpretation of conditions and chemical hazards known and/or anticipated to be present from available site data furnished by Mr. James L. Julien. Appendix A contains health-related chemical data for hazardous substances which may be present on-site.

The following Site Safety Plan (SSP) is intended solely for use by GAS and its employees during the proposed activities. Specifications herein are subject to review and revision based on actual conditions encountered in the field during site characterization activities.

Prior to the initiation of site activities, GAS employees involved shall read and understand this SSP and revisions made to it. A signature page (2) is provided to assure that each GAS employee involved understands this SSP.

KEY PERSONNEL

GAS Project Manager: Geoffrey B. Parish

GAS Resident Project Representative: To be assigned

The following individual(s) located on site will have the authority and responsibility to act on behalf of the GAS Project Manager to revise levels of protection for GAS employees and when deemed necessary recommend to Owner the cessation of activities on the site:

1. To be assigned

PERSONNEL ROLES

GAS Resident Project Representative - Functions as on-site coordinator and oversees all operations for the GAS Project Manager. Reports in a regular and comprehensive manner to the GAS Project Manager. Implements the site perimeter and maintains site security. Observes contractor and all on-site activities performed by laborers, technicians, and equipment operators. Ensures all on-site GAS personnel follow all GAS health and safety procedures, especially those concerning personal protective equipment, decontamination, and mechanical operations.

The GAS Resident Project Representative will determine if the GAS Emergency Response Plan should be initiated. It will be the GAS Resident Project Representatives responsibility to make sure an Incident/Injury/Illness Log form or a Resident Project Representative's Report of Contractor's Accident is filled out in the event of an emergency (Appendix B).

If the GAS Resident Project Representative notices a potential or probable unsafe act by a contractor, he will verbally inform the contractor's foreman or superintendent of the unsafe act; this notification will be recorded. If the unsafe act is not corrected within a reasonable amount of time, the GAS site supervisor will notify the contractor's foreman or superintendent of the unsafe act in writing. A copy of the written notification will be sent to the contractor's home office and GAS's project manager.

GAS Project Manager - The GAS Project Manager is assigned the responsibility for fulfillment of the terms of the contract with the Owner. He/she must oversee GAS activities and observe that legal and safety requirements affecting GAS's activities are met. It is his/her duty to keep GAS's work on schedule, within budget, and to communicate with the client regarding progress toward the specified goals. All GAS project personnel are responsible for reporting any and all potential or actual safety violations to the GAS Project Manager.

It will be the Project Manager's responsibility to report any emergency and any actions taken in response to that emergency to the GAS Environmental Division Manager, the client, and/or owner of the site.

SAFETY AND HEALTH RISK ANALYSIS VS. SITE TASK/OPERATION

Activity	Potential Hazard	Precautions
Drilling	Noise	• Ear plugs will be worn within 25 feet of any operating drill rig
Subsurface Soil Sampling/ Groundwater Sampling	Contact with contaminated soils/water	• Do not kneel on ground • Do not walk through discolored soils • Use personal protective clothing (minimum Level D)
	Inhalation	• Air monitor periodic PID/FID • Respirator on site
	Heat Stress	• Increase liquid consumption to replace water lost during sweating • Increase number of rest breaks • Increase salt consumption in diet. DO NOT USE SALT TABLETS
	Cold Stress	• Vehicle will be kept heated during cold weather • Blanket will be available on site during extremely cold conditions.
	Heavy Machinery	• Hard hat will be worn within 25 feet of any operating heavy machinery. • Safety shoes will be worn within 25 feet of any operating heavy machinery. • Ear plugs will be worn if necessary.

Activity	Potential Hazard	Precautions
	Utilities	• Inform Diggers Hotline • Make sure utilities are marked prior to work (documentation) • Observe overhead utilities • If any utilities or suspected utilities are unmarked, contact project manager and Diggers Hotline prior to the start of work
Sampling	Possible Chemical Sampling Spikes - (Methanol, Hydrochloric Acid and Nitric Acid)	• Read MSDS for each chemical (posted in equipment room or available from Dave Haas) • Wear butyl rubber or nitrile gloves over latex gloves while sampling • Wear protective face shield • Handle samples in a well ventilated area . Have respirator, tyvek and absorbent spill pad readily available • Report any spill or release to Ad Hoc safety committee member or the Environmental Division Manager • When handling or working near methanol, an appropriate fire extinguisher will be readily available

STANDARD OPERATING PROCEDURES

Personal Precautions

- The project manager(s) and all GAS personnel who visit the site shall read and sign the SSP.
- GAS Personnel must be familiar with standard operating safety procedures and any additional instructions and information contained in this Site Safety Plan.
- GAS Personnel must adhere to the information contained in this Site Safety Plan
- GAS Personnel will be aware of the symptoms caused by exposure to hazardous chemicals on site and for heat or cold stress.
- Eating, drinking, chewing gum or tobacco, smoking, or any practice that increases the probability of hand-to- mouth transfer and ingestion of material is prohibited on the project site and in any area designated contaminated.
- All GAS personnel must thoroughly wash hands and face prior to leaving the work area.
- GAS Personnel shall not enter confined spaces where an oxygen-deficient or toxic atmosphere may exist without wearing the required safety equipment and obtaining the prior approval of the Project Manager.
- Hard hat, safety glasses, and safety shoes shall be required during operation of any heavy machinery.
- GAS personnel will pull off-site to re-evaluate the situation if there are any indications of on-site hazardous chemicals or waste other than the petroleum contamination stated in this SSP.
- GAS personnel shall not wear facial hair which interferes with a satisfactory fit of the mask-to-face- seal while wearing a respirator.
- Contact lenses cannot be worn when respirator protection is required or when the hazard of a splash exists.
- Respirators shall be cleaned and disinfected after each day's use or more often if necessary.
- Respirators will be inspected for worn or deteriorated parts prior to being used. Emergency respirators or self contained breathing apparatus (SCBA) will be inspected at least once a month, and before and after each use.

Site Activities

- Unauthorized GAS Personnel are not permitted on the project site.
- No smoking, open flames, or sparks will be permitted within 50 feet of the working area.
- All electrical tools will be double grounded, and inspected for bare wiring prior to use.
- Regular inspections of site activities will be conducted by the Site Supervisor to monitor compliance with the SSP. If any changes in operations by Contractors occur, the SSP will be modified to reflect changes.
- Contractor shall have their own SSP on site.

EMPLOYEE EDUCATION AND TRAINING

GAS employees involved in site activities participate in routine health and safety education and training programs. These programs are designed to provide the employees with a knowledge of hazardous materials, health and safety hazard potentials and requirements of federal OSHA 29CFR 1910.120(e). Employees are required to have 40 hours of formal instruction. Supervisors are required to have an additional 8 hours of specialized training. Employees will have their training certifications with them on site. As a minimum, this training includes the following:

- General Safety Rules
- Basics of Chemistry
- Basics of Toxicology/Physiology
- Hazardous Materials (types/characteristics)
- Hazard Communication Information
- Respiratory Protection
- Respiratory Training
- Chemical Protective Clothing
- Decontamination Procedures/Personal Hygiene
- Fire Prevention/Protection
- First Aid/CPR
- Confined Space Work/Safety
- Atmospheric Testing/Sampling Procedures
- Emergency Response Procedures
- Electrical Hazard
- Federal and State Regulations

PERSONAL PROTECTIVE EQUIPMENT

Introduction

GAS personnel will not work in areas requiring Level A or B personal protection equipment. The use of the two person buddy system is required when working in an area with Level C protection. If protection levels of A, B or C become necessary, GAS personnel will leave the affected area until conditions have been stabilized at either the C or D protection level, and the necessary PPE and personnel are attained for protection level C.

Based on OVM photoionization detector (PID) or OVA flame ionization detector (FID) readings in the breathing zone THE CRITERIA used for levels of protection are as follows:

Background-50	Level D	Deviations from these
50-150 IUs above background	Level C	levels will be based on
>150 IUs above background	Level B or A	the type of petroleum product and its constituents.

Based on 2%-3% benzene in pure gasoline.

IUs = Instrument Units

Level of Protection	PPE	Protection Provided	Should be Used When:	Limiting Criteria
D	**Recommended:** • Coveralls.	No respiratory protection. Minimal skin protection.	• The atmosphere contains no known hazard.	• This level should not be worn in the Exclusion Zone.
	• Safety boots or shoes.		• Work functions preclude splashes, immersion, or the potential for unexpected inhalation of or contact with hazardous levels of any chemicals.	• The atmosphere must contain at least 19.5 percent oxygen.
	• Safety glasses or goggles.			
	• Hard hat.			
	Optional: • Gloves.			
	• Escape mask.			
	• Face shield.			
C	**Recommended:** • Full-facepiece, air-purifying, canister-equipped respirator.	The same level of skin protection as Level B, but a lower level of respiratory protection.	• The atmospheric contaminants, liquid splashes, or other direct contact will not adversely affect any exposed skin.	• Atmospheric concentration of chemicals must not exceed IDLH levels.
	• Chemical-resistant clothing (overalls and long-sleeved jacket; hooded, one- or two-piece chemical splash suit; disposable chemical-resistant one-piece suit).		• The types of air contaminants have been identified, concentrations measured, and a canister is available that can remove the contaminants.	• The atmosphere must contain at least 19.5 percent oxygen.
	• Inner and outer chemical-resistant gloves.		• All criteria for the use of air-purifying respirators are met.	
	• Chemical-resistant safety boots or shoes.			
	• Hard hat.			
	• Two-way radio communications.			
	Optional: • Coveralls.			
	• Disposable boot covers.			

Level of Protection	PPE	Protection Provided	Should be Used When:	Limiting Criteria
	• Face shield. • Escape mask. • Long cotton underwear.			
B	**Recommended:** • Pressure-demand, full-facepiece SCBA or pressure-demand supplied-air respirator with escape SCBA.	The same level of respiratory protection but less skin protection than Level A.	• The type and atmospheric concentration of substances have been identified and require a high level of respiratory protection, but less skin protection. This involves atmospheres:	• Use only when the vapor or gases present are not suspected of containing high concentrations of chemicals that are harmful to skin or capable of being absorbed through the intact skin.
	• Chemical-resistant clothing (overalls and long-sleeved jacket; hooded, one- or two-piece chemical splash suit; disposable chemical-resistant one-piece suit). • Inner and outer chemical-resistant gloves. • Chemical-resistant safety boots/shoes. • Two-way radio communications.	It is the minimum level recommended for initial site entries until the hazards have been further identified.	1. with IDLH concentrations of specific substances that do not represent a severe skin hazard; or 2. that do not meet the criteria for use of air-purifying respirators. • Atmosphere contains less than 19.5 percent oxygen. • Presence of incompletely identified vapors or gases is indicated by direct-reading organic vapor detection instrument, but vapors and gases are not suspected of containing high levels of chemicals harmful to skin or capable of being absorbed through the intact skin.	• Use only when it is highly unlikely that the work being done will generate either high concentrations of vapors, gases, or particulates or splashes of material that will affect exposed skin.
	Optional: • Coveralls.			

Level of Protection	PPE	Protection Provided	Should be Used When:	Limiting Criteria
	• Disposable boot covers. • Face shield. • Long cotton underwear.			
A	**Recommended:** • Pressure-demand, full-facepiece SCBA or pressure-demand supplied-air respirator with escape SCBA. • Fully-encapsulating, chemical-resistant suit. • Inner chemical-resistant gloves. • Chemical-resistant safety boots/shoes. • Two-way radio communications. **Optional:** • Cooling unit. • Coveralls.	The highest available level of respiratory, skin, and eye protection.	• The chemical substance has been identified and requires the highest level of protection for skin, eyes, and the respiratory system based on either: 1. measured for potential for high concentration of atmospheric vapors, gases, or particulates or 2. site operations and work functions involving a high potential for splash, immersion, or exposure to unexpected vapors, gases, or particulates of materials that are harmful to skin or capable of being absorbed through the intact skin. • Substances with a high degree of hazard to the skin are known or suspected to be present, and skin contact is possible. • Operations must be conducted in confined, poorly ventilated areas until the absence of conditions requiring Level A protection is determined.	• Fully-encapsulating suit material must be compatible with the substances involved.

Level of Protection	PPE	Protection Provided	Should be Used When:	Limiting Criteria
	• Long cotton underwear. • Hard hat. • Disposable gloves and boot covers.			

HEALTH SURVEILLANCE PROGRAM

All GAS employees involved with this work will have participated in a health surveillance program under the direction of an Occupational Physician. This program includes the following:

- Comprehensive Health and Exposure History
- Physical Evaluation
- Urinalysis
- SMAC 23 including total cholesterol and blood sugar
- Complete blood count (CBC), differential, hematocrit, and hemoglobin
- Chest X-ray
- Pulmonary Function Testing
- Vision Testing (distant, near)

Additionally, each employee has been evaluated to determine if they are physically able to perform work while using respiratory protective equipment in compliance with 29 CFR Part 1910.134 and ANSI Z88.2 - 1980. Each employee who is determined physically able to perform work while using respiratory equipment and their job classification may require wearing respiratory protective equipment shall be fit tested annually. In addition, these employees will be instructed in respirator care, cleaning, and usage annually.

SAMPLING AND AIR MONITORING PROTOCOL

The following is the protocol to be followed for any samples to be taken at the site.

Minimum Personal Protective Equipment: While spiking samples with a hazardous substance in the field, the minimum requirements are as follows:

Gloves - butyl rubber, neoprene, or nitrile over latex gloves
Protective face shield
Sample in a well ventilated area
Respirator, tyvek suit, and absorbent spill pad must be readily available

Water Samples: VOA analysis: Use a VOA bottle with Teflon septum. Eliminate all airspace in vial prior to capping vial when sampling. Place samples on ice in cooler and cool to 4°C. Complete a Chain-of-Custody form, and transport samples and Chain-of-Custody to laboratory. Inorganic analysis - bottles will be provided by laboratory as specified per analytical method.

Soil Samples for Cleanup Standards: Follow current Wisconsin Department of Natural Resources (WDNR) sampling guidelines. Place samples on ice in cooler and cool to 4°C. Complete a Chain-of-Custody form, and transport samples and Chain-of-Custody to laboratory. Change or clean outer disposable gloves before each sampling event.

Note: Soil samples that will be analyzed for gasoline range organics (GRO) using the modified GRO method, will be preserved in the field by immersion in methanol. Soil samples taken for analysis for diesel range organics (DRO), using the modified DRO method, must be shipped to the lab within four days for in-lab preservation by extraction.

Air monitoring for the site will be accomplished with the following: OVM brand photoionization detection meter equipped with an 10.6 electron volt lamp or an OVA brand flame ionization detector. Ambient air in the workers' breathing zone will be monitored constantly for VOCs. Background readings will be subtracted (See Appendices C and D).

Field Calibration Procedures

Preventive maintenance for instrumentation will be performed in accordance with the manufacturer's operation manuals. See Appendix C and D for step by step guideline for checking calibration of OVM photoionization detection meter and the OVA flame ionization detector.

CONTINGENCY PLAN/EMERGENCY RESPONSE PLAN

INTRODUCTION

The original Contingency Plan/Emergency Response Plan will be kept in the GAS central file. A complete copy will be kept by the project manager and in all GAS site vehicles. A complete copy will be readily available to the project manager, alternate project managers, and personnel in charge on-site.

Copies of pages 1 through 4 will be posted at the nearest phone located in the field vehicle, and kept readily available to the project manager, alternate project managers, and personnel in charge on-site. The pages will be posted with the Site Safety Information Sheets as the first two pages, the Map of the Emergency Route to the Hospital as the third page, and the Site Map with Emergency Gathering Area as the fourth page.

The Contingency Plan consists of emergency response procedures that will be implemented when an imminent or actual incident could threaten human health or the environment. The emergency response procedure will be implemented in the following serious situations:

1. Serious personal injury to anyone on site.

2. Fire and/or Explosion

   a. if a fire could cause the release of toxic fumes

   b. if the fire could spread and ignite materials at other locations on-site or cause related heat-induced explosions

   c. if the fire could spread to off-site areas

   d. if the use of water or water and chemical fire suppressant could result in the release of contaminated runoff

   e. if an imminent danger exists that an explosion could occur

   f. if an explosion has occurred

3. Spills or Material Leaks

   a. if a spill could result in the release of flammable liquids or vapors

   b. if a spill can be contained on-site, but the potential exists for possible groundwater contamination

   c. if a spill cannot be contained on-site

   Note: See Appendix E for implementation of procedures.

SITE CONTROL

Physical access to the site granted by Owner to GAS shall be along West National Avenue or South 66th Street.

Restricted site areas may include, but are not necessarily limited to the following:

- Exclusion (hot) zones - Specific hazards on site could warrant the establishment of an Exclusion Zone. If an Exclusion Zone is established, no unauthorized GAS Personnel will be permitted within the Exclusion Zone. This Zone will consist of a cordoned off area provided by the Contractor surrounding the work area within which a higher safety priority exists. Within this Zone the Standard Operating Procedures outlined previously will apply.

The need for Exclusion Zones at this site:

Presently there is no need for an exclusion zone at this site. If site conditions would change to warrant the need for an exclusion zone, a site map with all exclusion zone locations will be developed.

EMERGENCY RESPONSE PROCEDURES

CALL 9-1-1

In the event of an emergency situation, the West Allis Fire Department will be notified in accordance with these emergency response procedures. After the Fire Department has been notified, the GAS Resident Project Representative will immediately notify the GAS Project Manager. If the Project Manager cannot be contacted, the prioritized list of people to contact, located on the first page of the Site Safety Information sheet, should be used.

COORDINATION AGREEMENTS

In case of an on-site safety accident involving GAS personnel, and prior to their transportation to the hospital, the primary on-scene responsibility transfers from the GAS Resident Project Representative to the appropriate fire department and/or the paramedics when they arrive at the site:

- West Allis Fire Department for emergency fire and medical assistance
- West Allis Memorial Hospital for assistance in treating possible injuries due to a medical emergency
- West Allis Police Department for assistance during spill emergencies

EMERGENCY ACTION - STANDARD OPERATING PROCEDURES

CALL 9-1-1

In the event of an accident or medical emergency, immediately call 9-1-1. In the unlikely event the line is busy or inoperable, appropriate agency numbers are listed below.

HOSPITAL:	West Allis Memorial Hospital **546-6111**
AMBULANCE:	**9-1-1**
FIRE DEPARTMENT:	West Allis Fire Department **9-1-1**
SHERIFF/POLICE:	West Allis Police Department **9-1-1**

MEDICAL EMERGENCIES

Any person who becomes ill or injured in the Exclusion Zone must be decontaminated and given consideration which risk, the spread of contamination or the health of the individual will be greater (Appendix E). If the injury or illness is minor, full decontamination would be completed and first aid administered prior to transport. If the patient's condition is serious, at least partial decontamination would be completed (i.e., complete disrobing of the victim and redressing in clean coveralls or wrapping in a blanket). First aid will be administered while awaiting an ambulance or paramedics.

FIRST AID MEASURES

GAS personnel will adhere to time parameters for seeking definitive medical care for injuries and/or exposure which are discussed and agreed upon in the "Emergency Response Procedures". The following procedures will be used in the event that personnel exposure symptoms occur:

PETROLEUM PRODUCTS

Eye contact:	Flush eye immediately with copious amount of emergency eye wash or water. Repeat until irritation is eliminated. If prolonged irritation occurs, seek medical attention.
Skin contact:	Wash exposed area with emergency eye wash or soap and water. If dermatitis or severe reddening occurs, seek medical attention.

Inhalation: Remove person into fresh air, if symptom occurs, seek medical attention.

Ingestion: Do not induce vomiting, seek immediate medical attention.

Refer to attached hazardous constituent chemicals sheets (Appendix A) for information regarding chemical compounds which may be encountered during field procedures.

HOSPITAL: West Allis Memorial Hospital
8901 West Lincoln Avenue
West Allis, Wisconsin 53227
546-6111

The following are directions to West Allis Memorial Hospital from the Project Site:

Proceed approximately 1 mile west on National Avenue to 84th Street. Turn left on 84th Street. Proceed approximately 1/2 mile south to Lincoln Avenue. Turn right on Lincoln Avenue. Proceed 4 blocks west on Lincoln Avenue to 88th Street. Turn left on 88th Street. Proceed 1/2 block south to emergency entrance to hospital which is on the west side of 88th Street.

NOTE: Emergency routes to be verified and driven prior to any site activities.

FIRE OR EXPLOSION

The local fire department should be summoned immediately in the event of a fire or explosion. The field supervisor will advise the Fire Department Incident Commander, upon arrival, of the location, nature, and identification of the hazardous materials on-site. The field supervisor must be prepared to remain with the Fire Commander as an information resource.

If it is safe to do so and trained Fire Department staff are not yet on site, GAS employees may

1) Use fire fighting equipment available on site to control or extinguish the fire.

2) Remove or isolate flammable or other hazardous materials which may contribute to the fire.

SPECIFIC DECONTAMINATION PROCEDURES

Personal Decontamination: A decontamination area will be designated at least 50 feet upwind of the active work zone. The area will be a decontamination zone and will be used for personal washing and for discarding disposable protective clothing and wash water. Receptacles will be provided for collection of wash water and disposal of discarded protective clothing. All wastewater will be properly disposed of after characterization. An emergency first-aid kit and eye wash will be available for minor injuries.

APPENDIX A

HEALTH DATA ON HAZARDOUS CHEMICALS POSSIBLY PRESENT

CHEMICAL	TWA	STEL (15 Min)	C	IDLH	PHYSICAL DESCRIPTION	UEL	LEL	RESPIRATOR REQUIREMENT	EFFECTS
Benzene (C6H6)	0.1 ppm (NIOSH) 1 ppm (OSHA)	1 ppm (NIOSH) 5 ppm (OSHA)	NA	3,000 ppm Carcinogen	Colorless to light yellow aromatic liquid; solid <42°F.	7.9%	1.3%	Full-face, supplied air at any detectable concentration	Irritation of eyes, respiratory tract, nausea, light-headedness
Ethylbenzene (CH3CH2C6H5)	100 ppm	125 ppm	NA	2,000 ppm	Colorless, aromatic liquid.	6.7%	1.0%	SA at 1,000 ppm PAPR at 100 ppm	Irritation of eyes, mucous membranes
Gasoline	*30 ppm	500 ppm	NA	NA	Colorless, light yellow or light orange liquid. Aromatic.	6.0%	1.3%	SA at 2,000 ppm PAPR at 30 ppm	Anesthetic, Irritation of mucous membranes, head-aches, blurred vision, dizziness and nausea.
Hydrochloric Acid Solution (HCl)	5 ppm	NA	5 ppm	100 ppm	Clear, colorless, fuming liquid with a pungent, irritating odor.	NA	NA	SA at 50 ppm PAPR at 5 ppm	Inflamation of nose and throat; cough, burns throat, eyes, skin; choking.
Lead (Pb)	0.100 mg/m3 (NIOSH) 0.050 mg/m3 (OSHA)	NA	NA	700 mg/m3	Heavy, ductile, soft gray solid	NA	NA	SA at 0.5 mg/m3	Weakness, lassitude, low weight, malnutrition, hypotension, anemia
Methanol (CH3OH)	200 ppm	250 ppm	NA	25,000 ppm	Clear, colorless liquid with a characteristic pungent odor.	36.0%	6.0%	SA at 2,000 ppm PAPR at 200 ppm	Irritation of eyes, headaches, drowsiness, irritated skin, vomiting, blindness. Cumulative effect.
Nitric Acid (HNO3)	2 ppm	4 ppm	NA	100 ppm	Colorless, yellow or red, fuming liquid with an acrid, suffocating odor	NA	NA	SA at 2 ppm PAPR at 5 ppm	Irritation of the eyes, mucous membranes, skin; delayed pulmonary edema. Burns eyes and skin.

HEALTH DATA ON HAZARDOUS CHEMICALS POSSIBLY PRESENT

CHEMICAL	TWA	STEL (15 Min)	C	IDLH	PHYSICAL DESCRIPTION	UEL	LEL	RESPIRATOR REQUIREMENT	EFFECTS
Sodium Hydroxide Solution (NaOH)	NA	NA	2 mg/m3	250 mg/m3	Colorless, odorless liquid.	NA	NA	SA at 50 ppm	Irritation of nose; burns eyes and skin. Temporary loss of hair.
Toluene (C6H5CH3)	100 ppm	150 ppm	NA	2,000 ppm	Colorless liquid with sweet pungent, benzene-like odor	7.1%	1.2%	SA at 1,000 ppm PAPR at 100 ppm	Fatigue, weakness, confusion, dizziness
Xylene (o-, m-, p-, isomers) (C6H4(CH3)2)	100 ppm	150 ppm	NA	1,000 ppm	Colorless, aromatic liquid.	7.0%	1.1%	SA at 1,000 ppm PAPR at 100 ppm	Dizziness, excitement, drowsiness, incoherent Irritation of respiratory tract

Data Source: U.S. Department of Health and Human Services (1990), NIOSH Pocket Guide to Chemical Hazards, 245 pp.

NIOSH = National Institute for Occupational Safety and Health, TWA = Time-weighted Average, STEL = Short-term Exposure Limit, IDLH = Immediately Dangerous to Life or Health, UEL = Upper Explosive Level, LEL = Lower Explosive Level, SA = Supplied Air Respirator, PAPR = Powered, air purifying respirator. PAPR Limits required by GAS. C = Ceiling

** Based on a TWA of 1 ppm for Benzene.*

APPENDIX C

OVM DATALOGGER

MODEL 580B

The 580B is a portable Organic Vapor Meter (OVM) which detects and quantitates most organic vapors with a highly sensitive photoionization detector (PID). The 580B has an operating range of 0-2000 parts per million (ppm) with a minimum detectable of 0.1ppm. No support gases are required for operation.

The 580B is controlled by a microprocessor which provides many features that were not previously available. These include signal hold, detector linearization, overrange lockout, IBM PC (or IBM compatible) interface, and extensive data logging capabilities. With the many features provided by the 580B, leak detection, head space measurements and field surveys are all easily accomplished. This instrument is completely portable and will operate from internal batteries for eight hours in the field.

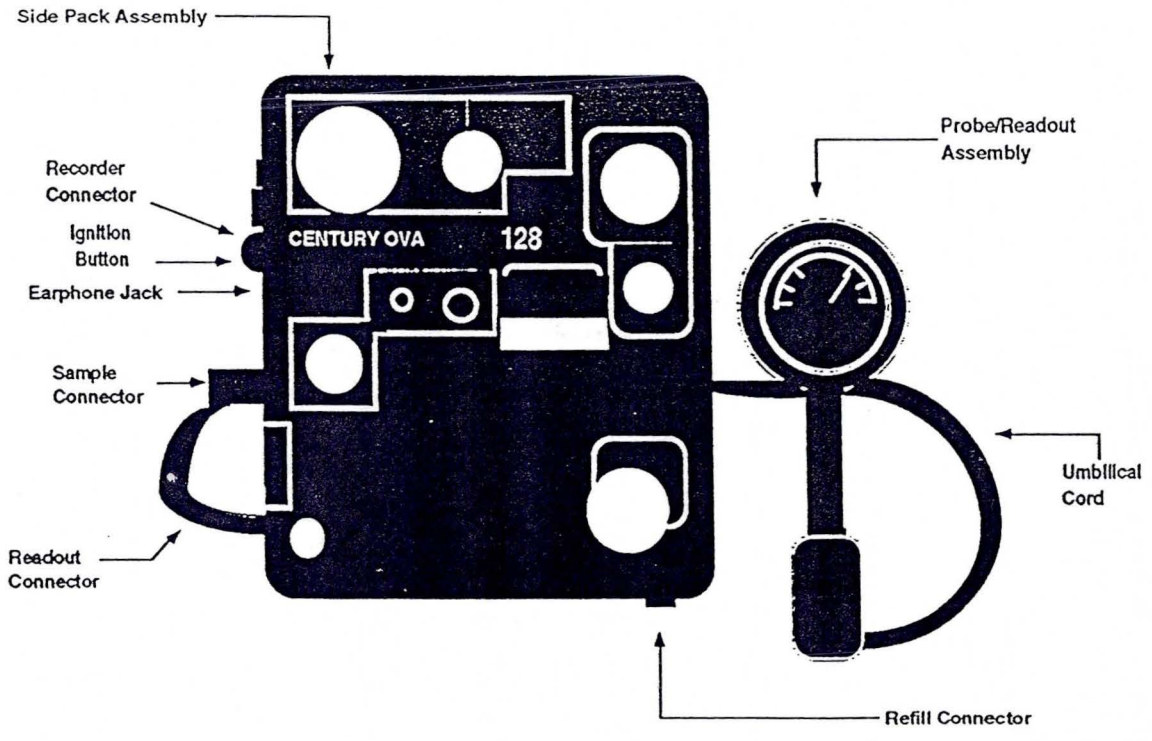
APPENDIX D

MODEL OVA 128
CENTURY ORGANIC VAPOR ANALYZER

GENERAL DESCRIPTION

The OVA 128 Analyzer is designed to detect and measure hazardous organic vapors and gases found in most industries. It has broad application since it has a chemically resistant sampling system and can be calibrated to almost all organic vapors. It can provide accurate indication of gas concentration in one of three ranges: 0 to 10 ppm; 0 to 100 ppm and 0 to 1000 ppm. While designed as a lightweight portable instrument, it can be permanently installed to monitor a fixed point.

The instrument utilizes the principle of hydrogen flame ionization for detection and measurement of organic vapors. The instrument measures organic vapor concentration by producing a response to an unknown sample, which can be related to a gas of known composition to which the instrument has previously been calibrated. During normal survey mode operation, a continuous sample is drawn into the probe and transmitted to the detector chamber by an internal pumping system.



The sample stream is metered and passed through particle filters before reaching the detector chamber. Inside the detector chamber, the sample is exposed to a hydrogen flame which ionizes the organic vapors. When most organic vapors bum, they leave positively charged carbon-containing ions. An electric field drives the ions to a collecting electrode. As the positive ions are collected, a current corresponding to the collection rate is generated. This current is measured with a linear electrometer preamplifier which has an output signal proportional to the ionization current. A signal conditioning amplifier is used to amplify the signal from the preamp meter or external recorder display. The display is an integral part of the Probe/Readout Assembly and has 270° scale deflection.

In general, the hydrogen flame ionization detector is more sensitive for hydrocarbons than any other class of organic compounds. The response of the OVA varies from compound to compound, but gives repeatable results with all types of hydrocarbons; i.e., saturated hydrocarbons (alkanes), unsaturated hydrocarbons (alkenes and alkynes) and aromatic hydrocarbons.

RE: Results of volatile organic compound contamination investigation of soils at the Pressed Steel Tank Company

Dear Jim:

The purpose of this letter is to report and document results of the volatile organic compound (VOC) investigation of soils, recommended by the Wisconsin Department of Natural Resources (WDNR) for the Pressed Steel Tank site located at 1445 South 66th Street, West Allis, Wisconsin.

On June 22, 1994, Graef, Anhalt, Schloemer & Associates Inc. (GAS) and Wisconsin Soil Testing (the contracted drillers) completed three soil borings (SB-25, SB-26 and SB-27) to a depth of 35 feet below ground surface (bgs) (Figure 1). The borings were advanced and continuously sampled in two-foot increments using hollow-stem auger and split-spoon sampling methods as described in American Society for Testing and Materials (ASTM) method D1586. To prevent potential cross-contamination, all sampling tools and downhole equipment were steam cleaned prior to drilling each boring. The split-spoon soil sampler and all sampling tools were washed in an aqueous solution of trisodium phosphate and double rinsed with clean tap water between sampling intervals.

Split soil samples were collected in pairs, one for field screening and one for possible submittal to an analytical laboratory for analysis. Field screening was performed in accordance with specifications outlined in the WDNR LUST Field Screening Procedures (PUBL-SW-176), and all analytical soil samples were collected in accordance with WDNR guidelines (PUBL-SW-175-92). Three soil samples were selected from each boring and submitted to a WDNR certified laboratory for analysis of VOC's, EPA method 8021. The samples for analysis were selected as follows: one from the interval with the highest field screening reading (which occurred at or near the water table); one from a lower depth where a second peak was detected; and one at or near the bottom of the boring, depending on field screening readings.

Examination of analytical results indicated low level detections of VOCs in all three borings. However, only one VOC that was of concern to groundwater from previous water sampling events,

trichloroethene, was detected in SB-26, at 200 parts per billion (ppb) from the 7-9 feet depth, and 1,600 ppb at the 17-19 feet depth. Analytical reports and Laboratory Results Table are contained in Appendix E and are shown on the table in Appendix D.

The following documents have been enclosed for your review:

- Site Map
- Soil Boring Logs
- Soil Boring Abandonment Forms
- Table of Field Screening Results
- Table of Soil Sample Laboratory Results
- Analytical Results Reports

Based on results of the VOC investigation, GAS feels the low levels of VOCs detected in the soils do not warrant excavation of said soils at this point. However, GAS does recommend proceeding with the proposed recovery trench remedial alternative discussed in the letter to Chip Krohn of the WDNR dated January 19, 1994 and described in the Remedial Feasibility Study dated September, 1994.

Upon your approval, a copy of this transmittal, along with the RI/FS Report, will be forwarded to Chip Krohn at the WDNR.

If you have any questions concerning the VOC investigation, the results or recommendations please call us at (414) 256-4060.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

WELL/DRILLHOLE/BOREHOLE ABANDONMENT

Form 3300-5B Rev. 7-89

All abandonment work shall be performed in accordance with the provisions of Chapters NR 111, NR 112 or NR 141, Wis. Admin. Code, whichever is applicable. Also, see instructions on back.

(1) GENERAL INFORMATION

Well/Drillhole/Borehole Location

County: MILWAUKEE

NW 1/4 of NE 1/4 of Sec. 3 ; T. 6 N; R. 21 ☒ E ☐ W

(If applicable) Gov't Lot _____ Grid Number

Grid Location _____ ft. ☐ N. ☐ S., _____ ft. ☐ E. ☐ W.

Civil Town Name: WEST ALLIS

Street Address of Well: 1445 SOUTH 66TH STREET

City, Village: WEST ALLIS

(2) FACILITY NAME

Original Well Owner (If Known): PRESSED STEEL TANK INC.

Present Well Owner: SAME

Street or Route: 1445 SOUTH 66TH STREET

City, State, Zip Code: WEST ALLIS, WISCONSIN 53214

Facility Well No. and/or Name (If Applicable): SOIL BORING SB-26

WI Unique Well No.: _ _ _ _ _

Reason For Abandonment: FOR SOIL SAMPLING ONLY

Date of Abandonment: 6/22/94

WELL/DRILLHOLE/BOREHOLE INFORMATION

(3) Original Well/Drillhole/Borehole Construction Completed On

(Date) 6/22/94

☐ Monitoring Well
☐ Water Well
☐ Drillhole
☒ Borehole

Construction Report Available? ☐ Yes ☐ No

Construction Type:
☒ Drilled ☐ Driven (Sandpoint) ☐ Dug
☐ Other (Specify) _____

Formation Type:
☒ Unconsolidated Formation ☐ Bedrock

Total Borehole Depth (ft.) 35 Casing Diameter (ins.) NA
(From ground surface)

Casing Depth (ft.) NA

Was Well Annular Space Grouted? ☐ Yes ☐ No ☐ Unknown
If Yes, To What Depth? NA Feet

(4) Depth to Water (Feet) APPROX. 5 FT

Pump & Piping Removed?	☐ Yes	☐ No	☒ Not Applicable
Liner(s) Removed?	☐ Yes	☐ No	☒ Not Applicable
Screen Removed?	☐ Yes	☐ No	☒ Not Applicable
Casing Left in Place?	☐ Yes	☐ No	

If No, Explain _____

Was Casing Cut Off Below Surface?	☐ Yes	☐ No	☒ NA
Did Sealing Material Rise to Surface?	☐ Yes	☐ No	☒ NA
Did Material Settle After 24 Hours?	☐ Yes	☐ No	☒ NA
If Yes, Was Hole Retopped?	☐ Yes	☐ No	

(5) Required Method of Sealing Material
☒ Conductor Pipe-Gravity ☐ Conductor Pipe-Pumped
☐ Dump Bailer ☐ Other (Explain)

(6) Sealing Materials — For monitoring wells and monitoring well boreholes only
☐ Neat Cement Grout
☐ Sand-Cement (Concrete) Grout
☐ Concrete

The enclosed reports contain the analytical results for the soil samples submitted to ORTEK Environmental Laboratory on June 24, 1994. The samples were analyzed according to the Chain of Custody Form.

Everything we do at ORTEK depends upon our customer's satisfaction. We respect your analytical needs in a professional and courteous manner from the initial contact to your final report.

If you have any questions or comments about the enclosed information or our services, feel free to contact me at (414) 498-2222. Please have the reference numbers listed above when making inquiries regarding this report.

Thank you for making ORTEK your analytical laboratory!

Sincerely,

Victoria Cook

Subject: Pressed Steel Tank Meeting

Site visit August 23, 1994 - Geoffrey Parrish Project Mgr., PST Management

See attached map for locations of additional proposed borings and delineation of contaminants. GAS plans to submit a proposal for groundwater recovery (trench) and passive biodegradation of contaminants. GAS feels there is very little room to conduct massive soil removal given the location of the buildings and National Ave. The trench will be proposed to address groundwater contamination and over time the effectiveness of natural degradation will be determined. If natural biodegradation is found not to be effective at the site GAS proposes to assess methods to add an "active" element to the soil remediation.

Milwaukee, WI 53214

Dear Sir,

RE: PECFA Form 4 Submittal
Pressed Steel Tank
1445 S. 66th Street
Milwaukee, WI 53214

Enclosed please find an executed PECFA Form 4 and a letter from GAS Engineers which lists the investigation activities which have been performed and documents that have been submitted since the last PECFA Form 4 was executed on April 8, 1991.

The Wisconsin Department of Natural Resources signature on the Form 4, signifies compliance with regulations pertaining to environmental investigation as outlined in the GAS reports listed in the enclosed letter dated May 19, 1994.

The Department has requested that an evaluation be made of halogenated compounds on the site before an approval can be considered for the remedial action plan that has been proposed by your consultant.

This will be the second Form 4 submitted for the referenced Pressed Steel site. As with the first reimbursement request, the Department of Industry, Labor, and Human Relations will make a determination on the eligibility of expenditures, and the suitability of making a progress payment at this time. Please direct all questions concerning reimbursement directly to the Department of Industry, Labor, and Human Relations.

Sincerely,

Charles J. Krohn
Hydrogeologist

RE: Pressed Steel Tank Inc.

Dear Chip:

This letter is to provide you with a listing of tasks performed at Pressed Steel Tank Inc., located at 1445 South 66th Street, West Allis, Wisconsin, for the investigation/remediation, as per our phone conversation of May 17, 1994. Since the last PECFA reimbursement application three work plans were prepared and implemented. The first work plan was for five soil borings, of which three were converted to monitoring wells. A report was prepared documenting the results of the investigation. The second work plan was for eight soil borings/wells. Of those wells proposed, only six were installed after new groundwater sampling data was obtained. The third work plan was for obtaining six soil samples and three groundwater samples for bioenumeration analyses, installation of a groundwater recovery well, pump testing and vapor extraction testing. As per our phone conversation of May 17 and the GAS fax of May 15, three soil borings will be drilled to investigate the extent of VOC contamination in site soils in the area of well MW-1A (in response to your letter of May 10, 1994). The results of that investigation will be documented in a letter report. The results of the previous investigation, groundwater monitoring and feasibility testing were described in a report, the finalization of which was suspended pending WDNR approval of the conceptual remedial approach. The Feasibility Study report will be finalized upon completion of the investigation of the investigation of the VOC contamination.

Activities listed on GAS invoices to Pressed Steel Tank, Inc. since the last PECFA claim are as follows:

- November to December 1990 and February to March 1991: project management and preparation of a work plan for continued investigation;
- May 1991: soil borings, installation and development of monitoring wells, survey wells and project management;

- June 1991: project management, monitoring well sampling, PECFA processing and investigation report preparation;
- July 1991: project management, slug test wells, PECFA processing and investigation report preparation;
- August 1991: project management and investigation report preparation;
- September 1991: groundwater monitoring, project management and investigation report preparation;
- October 1991: project management and investigation report preparation;
- November 1991: project management and investigation report preparation;
- December 1991: project management and investigation report preparation;
- January 1992: project management and investigation report preparation;
- February 1992: project management and investigation report preparation;
- March 1992: project management;
- April and June 1992: project Management and planning;
- July 1992: project Management and planning;
- August to October 1992: project management, develop work plan and groundwater sampling;
- November 1992: project management, groundwater sampling and data analysis;
- December 1992: project management, soil sampling, field screening, groundwater sampling, data analysis and laboratory analysis;
- January 1993: project management, groundwater sampling, data analysis and laboratory analysis;
- February 1993: project management and data analysis;
- March 1993: project management, feasibility study work plan and data analysis;
- April 1993: project management and feasibility study work plan;

- ay 1993: project management and feasibility study;
- ne 1993: project management and waste management;
- ly 1993: project management and waste management;
- ugust 1993: project management, well development and well sampling
- eptember 1993: project management, report preparation and well development
- October to November 1993: project management, report preparation, well development, laboratory analysis of groundwater samples, field forms, groundwater sampling and bioenumeration analysis;
- December 1993: project management and report preparation;
- January 1994: project management and report preparation;
- February 1994: project management and report preparation;
- March 1994: project management, groundwater monitoring and report preparation.

RE: Pressed Steel Tank Inc.

Dear Chip:

This letter is in regard to the issues raised in your May 10, 1994 letter wherein you reference halogenated volatile organic compound contamination (VOC) at Pressed Steel Tank Inc. and the need to address the extent of halogenated VOC soil contamination prior to approval of a conceptual remedial action. GAS proposes to address the extent of halogenated VOC soil contamination by drilling of three soil borings, located as shown of the enclosed map. Soil samples will be collected using standard environmental hollow stem auger techniques. Soil samples will be field screened in the field to determine the probable vertical distribution of impacts. Laboratory samples will be collected from the intervals where groundwater impacts have been documented, the bottom of borings. Laboratory samples will be analyzed for VOCs using EPA method 8021. A brief letter will present the results of field screening and laboratory analysis as soon as results are available.

If you have any questions or comments, please call us at 256-4060.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

Maintenance Supervisor
Pressed Steel Tank Co. Inc.
1556 South 66th Street
Milwaukee, WI 53214

Dear Mr. Julian:

RE: PECFA Form 4 Submittal
Pressed Steel Tank
Milwaukee, Wisconsin

Enclosed please find an executed copy of the referenced PECFA Form 4 for the referenced site. Based on information contained in the GAS Inc. Phase II report dated August, 1990, investigation and initial limited soil excavation were done according to WDNR rules and regulations.

The plume has not yet been defined and therefore a remedial action plan has not been submitted. Additional work will be required to properly define the adsorbed phase and dissolved phase plume before a remedial alternative can be selected for the site.

The existence of halogenated hydrocarbons in groundwater may be from a source which is not eligible for PECFA reimbursement. DILHR will make a determination on the suitability of a progress payment and the eligibility of costs which may be related to investigation of contamination not associated to an eligible underground storage tank.

Sincerely,

Charles J. Krohn
Hydrogeologist

Section 101.143 (3) (c) 4, Wis. Stats., requires that a claimant obtain written approval from the Department of Natural Resources (DNR) when requesting reimbursement for activities in response to a discharge from a commercial petroleum product storage system or home oil tank. The DNR approval must indicate that the site investigation and remedial action plan is adequate to meet requirements of s. 144.76, Wis. Stats. The DNR approval is created for the purpose of meeting the requirements of s. 101.143 (3), Wis. Stats., only and does not bar the DNR from requiring that additional investigation and/or remediation activities be performed by persons responsible under s. 144.76, Wis. Stats.

DNR Use Only

Any DNR / DOJ Enforcement Action(s) or DNR LUST Trust Expenditures on this site? ☐ Yes ☐ No

If answer is yes, please provide pertinent details on attached sheet.

Claimant's Name	Remedial Action Site Name (if business)
Pressed Steel Tank Inc.	Pressed Steel Tank Inc.
Street Address	**Remedial Action Site Address**

Dear Mr. Parish,

RE: Response to February 22, 1994 Letter Proposal
Pressed Steel Tank

This letter is in response to your Pressed Steel Tank conceptual remediation proposal dated February 22, 1994. In the referenced letter, you request Department approval for groundwater treatment and passive bio-remediation of contaminated soil at the Pressed Steel site.

In earlier investigation reports, halogenated compounds were detected in groundwater at the site. In a report dated June 1993, the text concentrates on the petroleum hydrocarbons but does not specifically address the halogenated compounds.

In order for the Department to approve passive bio-remediation as a reemdial method for the Pressed Steel Tank site, the method must be able to degrade the halogenated compounds which were detected during the original investigation. It makes little sense to conduct two separate remediations at the site within a commingled plume; the remedial design should address all contaminants. In order to determine the effectiveness of natural biodegradation for the halogenated compounds, the halogenated compound soil contaminant levels must first be determined. The soils may not be contaminated to a significant degree, as you stated on the phone, but the Department needs to know both the specific soil contaminant levels and the effectiveness of natural degradation for the specific concentrations of halogenated compounds in the soil.

Your February 22, 1994 letter does not address or reference the halogenated plume when asking for WDNR approval of a conceptual natural bio-remediation plan. A WDNR approval of the conceptual remediation at this time would be premature, and would refer only to the petroleum hydrocarbon portion of the plume. All compounds should be addressed in the remedial design.

Sincerely,

Charles J. Krohn
Hydrogeologist

RE: Pressed Steel Tank

Dear Mr. Krohn:

Graef, Anhalt, Schloemer & Associates Inc. (GAS) completed the remedial investigation and feasibility testing at Pressed Steel Tank Inc., 1445 South 66th Street, West Allis, Wisconsin, as described in the Work Plan approved by the WDNR on July 16, 1993. A report documenting the results will follow shortly. During development of recovery well RW-1, it was found that the conductivity of the sediments at the site, 0.18 gallons per day per square foot, was too low for groundwater remediation utilizing one well or a series of wells to be practically feasible. The limited capture zone expected from recovery wells is very limited. Similarly, the estimated intrinsic permeability of the soils was too low for soil vapor extraction. Accordingly, the planned pump and vapor extraction tests were not conducted. Results of a bio-assay test conducted during the investigation indicated the presence of a viable bacteria population. This would indicate that any residual soil contamination could be remediated by passive bio-remediation.

GAS is proposing a course of action that will remediate contaminated groundwater and any residual soil contamination resulting from a leaking underground storage tank. Based on site conditions identified during remedial investigations, GAS proposes that a trench system in the area of groundwater contamination and a converted groundwater monitoring well (attached drawing) be used to collect the contaminated groundwater which will then be treated on site. Passive bio-remediation progress of the soil will be monitored by collecting soil samples from the petroleum contaminated area on a yearly basis, and analyzing for parameters such as petroleum contamination, nutrient, and bacteria population levels. The results can then be used to determine if changes in the remedial action are required.

Trench System

As shown in the attached drawing, the total trench length will be approximately 100 feet. The trench depth will be approximately 12 feet. This depth was chosen so groundwater from the sandy backfill that extends to a depth of 10 feet along the south side of the building, can be captured.

The trench will then be backfilled with gravel and asphalted. The bottom of the trench will be sloped toward RW-1, which will therefore act as a sump. If excavated soil appears to be stained or has an obvious petroleum odor, it will be disposed of in a licensed landfill.

Groundwater Treatment System

As stated above, MW-1A will be converted to a groundwater recovery well. In addition, RW-1 will be used to remove collected trench water. The groundwater would then pass through an air stripper/activated carbon filter treatment system if necessary, and discharged to the Milwaukee Metropolitan Sewerage District (MMSD) sanitary sewer system. The water is then expected to meet MMSD's standards for discharge in the sanitary sewer. Based on calculations for potential air emissions, an air permit will not be required because none of the compounds detected during previous sampling events (benzene, 1,2 dichloroethene, ethylbenzene, napthalene, toluene, trichloroethene, vinyl chloride, xylene & trimethylbenzene) exceed their respective NR445 limits.. All calculated parameters were well below their respective standards.

Upon your approval of the proposed concept, GAS will develop an in-depth Remedial Action Plan.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

I. INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) is pleased to present this Work Plan for a Remedial Feasibility Study to Pressed Steel Tank, Inc. This Feasibility Study is in response to the June 3, 1992 WDNR request for alternatives to actively address soil and groundwater contamination. The purpose of this study is to determine the feasibility of groundwater remediation by pump and treat methods and soil and groundwater remediation by in situ bioremedial methods for site gasoline contamination.

GAS was retained by Pressed Steel Tank, Inc. to complete a Remedial Investigation addressing the subsurface contamination detected during removal of one 1,000-gallon underground gasoline storage tank located at 1445 South 66th Street, West Allis Wisconsin (Figure 1). Site activities completed to date have involved removal of the 1,000-gallon underground storage tank, and the completion of three sets of soil borings and monitoring wells. The first set of monitoring wells, MW-1A, MW-2A and MW-3A, was installed in April, 1990. The second set of wells was installed in May 1991. The third set of wells was installed in December 1992.

A. Background

1. Site History

Pressed Steel Tank, Inc. has manufactured steel tanks and various foundry products for approximately 100 years. The plant is located at 1445 South 66th Street, West Allis, Wisconsin.

The 1,000-gallon tank removed September 19, 1989 was used as a source of gasoline for in-plant trucks servicing the needs of the factory. The tank reportedly only contained gasoline. No records of inventory or non-operation are available. The tank was never leak tested, repaired or replaced. The age of the tank is unknown, however, it is reported to be older than 30 years.

As no single incident of a significant spill around the tank area was ever recorded, the contamination most likely is a result of leaking piping runs and/or leaks from the tank itself that accumulated over a long period of time.

B. Geology and Hydrogeology

1. Soils

Soils encountered at the site ranged in texture from clays to sands. Sands were encountered adjacent to the loading dock extending from the surface to 11 ft. below ground surface (bgs). Sands were also encountered below the parking lot near the corner of South 66th Street and National Avenue from 17 to 24 ft. bgs. It is not known if the sands at the loading dock are continuously connected to the sands below the parking lot. All other sampled locations had sandy clays, silty clays or clays.

2. Groundwater

The water table at the site occurs from 1 to 7 ft. bgs. In some places, such as at MW-2 and MW-3, the water table is located in a sandy unit. Whereas at all other investigated locations the water table is located in a clayey unit. Groundwater flow is to the south and east. The horizontal gradient of the water table ranges from approximately 1 E-2 to 7 E-2 ft/ft. The site is located in an industrial area with very few grassy, or otherwise un-sealed areas available for groundwater recharge. The recharge of the wells at the site was characterized as slow to very slow.

The net result of the above characteristics is that little water is expected to be produced by a recovery well installed in the site sediments and the flow of groundwater and transport of contaminants through the site soils is expected to be slow.

C. Extent of Contamination

1. Soils

Based on in-field VOC screening and laboratory analysis of soil samples collected during the tank removal and two soil boring events, gasoline contamination appears to be limited to the area illustrated in Figure 2. Additional compounds are present beyond the area illustrated in Figure 2, but these compounds are not found in gasoline and therefore probably were introduced into site soils by another source. Soil boring samples that had detected TPH concentrations characterized as gasoline were SB-2 (500 ppm) at 7-9 feet,

and SB-4 (470 ppm) at 3-5 feet. Residual contamination remains in the tank excavation walls and floor, based on results from soil samples collected during the tank removal assessment. Results from all other soil boring samples submitted for laboratory analysis registered no detection. Please see Appendix A for laboratory results of soil analysis.

2. Groundwater

Based on laboratory analysis of groundwater samples collected in November, 1992, contaminated groundwater exists in the area illustrated in Figure 3. Table 1 summarizes the concentrations of various compounds detected in MW-1 through MW-6. Various VOCs and gasoline related compounds were detected. However the extent of petroleum related contamination appears to have decreased since the June, 1991 sampling, when exceedances occurred at MW-3. Contaminant levels appear to be increasing at MW-2. The ethylbenzene level increased from 3700 to 7200 ppb, and the xylenes level increased from 1500 to 25,000 ppb. A water table monitoring well, MW-1C, installed adjacent to MW-1 (MW-1 was completed approximately 15 feet. below the water table) had exceedances of petroleum related compounds. Benzene (120 ppb) exceeded the Enforcement Standard and naphthalene (20 ppb), toluene (110 ppb) and xylenes (310 ppb) exceeded the Preventive Action Limits. Please see Appendix B for laboratory results of groundwater analysis.

D. Remedial Alternatives

There are several feasible remedial alternatives that address the petroleum soil and groundwater contamination. The first of these is groundwater pump and treat whereby contaminated groundwater is pumped from the ground, processed through an above ground treatment system and discharged to a sanitary or storm sewer. The drawback to groundwater pump and treat at the site is the variable conductivity soils. The lower conductivity silty and sandy clays will require a longer time and more wells to effect cleanup than coarser-grained soils. The next remedial method is soil vapor extraction. A blower is used to create a vacuum in the soils to move vapors through the soils. The volatile fraction of soil contamination partitions into the soil vapor and is extracted from the site soils by the blower. There are two drawbacks to use of this method at the site. The first is the variable conductivity soils. The lower conductivity silty and sandy clays will require a longer time and more wells to affect cleanup than coarser-grained soils. The second is

that a high water table will require lowering before vapor extraction can be effective. The final remedial method is enhanced natural bioremediation. The site conditions limiting natural bioremediation will be augmented so that natural biological processes can speed remediation of the soil and groundwater contamination.

II. SCOPE OF SERVICE

The scope of work includes four basic tasks: subsurface permeability testing, biological testing, data analysis, and report preparation. A groundwater recovery well will be installed and pumped, and data will be gathered from on-site monitoring wells to determine the hydrological properties of the site sediments. While the recovery well is being pumped, a soil vapor extraction test will be run on the pumping well. When the subsurface properties are known, the number and placement of additional groundwater or soil recovery wells can be determined. To determine the feasibility of enhancing natural biodegradation soil and groundwater samples will be collected for comparative microbiological enumerative analyses and basic nutrient analyses. The comparative microbiological enumerative analyses will determine the extent of contaminant-degrading microorganisms present on the site and establish a base line for later comparison. The nutrient analysis will determine the factors limiting biological growth in the soils and groundwater. The applicability of bioremedial technologies will then be evaluated. The test results will be submitted in a report that documents the field and laboratory activities, summarizes the pertinent results, and presents recommendations for remedial technology.

III. TASKS

A. Groundwater Testing

1. Well Installation

A groundwater recovery well (RW-1) will be installed in the area of the most permeable soils and highest contaminant concentration, adjacent to MW-2 (Figure 4). The groundwater recovery well will be installed in accordance with NR141 regulations. The well will be constructed of six inch diameter schedule 40 PVC and will extend to a depth of 25 feet. The well will be screened from one foot below grade because of the shallow depth of site

groundwater. The borehole will be sampled and the samples will be logged for soil texture, color, moisture, USCS soil classification and geologic origin. The data will be reported to the WDNR using WDNR Form 4400-122 and well construction will be reported using WDNR Form 4400-113A.

2. Well Pumping/Bail Down Testing

The recovery well will be pumped with a low flow, electrical, submersible, multistage, impeller pump. The level of the local water table will be monitored in site water table monitoring wells using down well pressure transducers and a data logger. The water level data will be input to a computer for analysis of site hydrogeological properties.

The pumped water will be discharged to an above ground holding tank pending disposal. The water in the pumping well will be sampled during the middle and at the end of the pump test to facilitate planning and permitting of the remedial treatment system.

B. Soil Vapor Testing

1. Vapor Sampling

A vacuum blower will be used to induce a vacuum in the recovery well. Samples of the soil gas being emitted to the atmosphere will be collected during each test. Carbon tubes will be used to collect the vapor samples for laboratory analysis. The carbon tubes will be connected to a sampling port on the soil vapor extraction testing equipment with tygon tubing, and air will be drawn through the tygon tubing with a peristaltic pump. The VOCs in the extracted soil gas will be adsorbed to the activated carbon, and the carbon tubes submitted for laboratory analysis.

Five samples of emitted vapors will be collected from the sampling port, in the two-inch pipe connecting the recovery well, and the vapor extraction system during the test. Successive samples of 0.5 L, 1.0 L, 2.0 L, 10.0 L, and 20.0 L will be passed through the carbon tubes at a rate of 0.5 L/min. A field blank will be collected for quality assurance/quality control (QA/QC).

The laboratory analysis will include the mass of benzene and VOCs adsorbed to the carbon. To obtain the concentration of the compounds in the emitted vapors, the mass of the compound will be divided by the sample volume. To obtain the emission rates for benzene and VOCs, the concentrations will then be multiplied by the vapor flow rate.

To determine the vapor flow rate, air velocities will be measured with an averaging Pitot tube in the pipe connecting recovery well VRW-1 and the vapor extraction system. Temperature and pressure will be measured in the pipe connecting VRW-1 and the vapor extraction system.

2. Permeability Estimation

To estimate soil permeability to air flow, soil gas vacuum measurements will be taken during the first two to ten minutes of each test, while the vacuum is changing. The vacuum will be measured with a PVC fitting, tubing, and a magnehelic pressure gauge. Transient vacuum will be measured at MW-2, MW-2, and MW-5 to estimate permeability. Vacuum readings will also be used to estimate radius of influence.

C. Biological Testing

Soil and groundwater samples will be collected for comparative enumeration assays (CEAs) and basic nutrient analysis. Dissolved oxygen will be measured in site monitoring wells. The results of the analyses will be used to determine the feasibility of enhanced bioremediation of site contamination, possibly by injection of air or oxygenated water. The results will provide base line data concerning the subsurface micro biological environment.

1. Soil Sampling

Soil samples will be collected from the different site soil types based on grain size (major grain size types such as sand, silt and clay). Samples will be collected from areas of heavy soil contamination, moderate soil contamination and uncontaminated areas, respectively (Figure 5). Soil samples will be obtained using hollow stem auger drilling and split spoon sampling techniques. Samples will be collected using the aseptic techniques recommended by Biorenewal Laboratories (Appendix C).

2. Groundwater Sampling

Groundwater samples will be collected from areas of heavy groundwater contamination, moderate groundwater contamination and uncontaminated areas (Figure 5). Groundwater samples (GW-1, GW-2, and GW-3) will be collected from existing site wells using the aseptic techniques recommended by Biorenewal Laboratories (Appendix C).

D. Data Analysis

A description of the degree and extent of contamination will be presented based on the laboratory results from analysis of soil and groundwater samples. A risk assessment will be developed based on available site information. The results of the pump test and vapor extraction testing will be analyzed to determine the subsurface characteristics necessary for planning the remediation system. The results of the biological testing will provide base-line data necessary for gauging the degree of natural biological enhancement.

E. Report Preparation

A remedial investigation/feasibility study will be prepared for submittal to the WDNR. The report will document the extent of soil and groundwater contamination at the site resulting from the underground storage tank. The report will discuss feasible methods for soil and groundwater remediation, and will provide a recommendation for the most cost effective and feasible method.

IV. TIME TABLE

Upon approval of the work plan, it is estimated that field work can be completed within two weeks of scheduling a drilling contractor. Laboratory results are anticipated three to four weeks after submittal of samples. The report can be prepared in two weeks following receipt of the laboratory samples.

APPENDIX C

Comparative Microbiological Enumeration Assay

Groundwater Sampling Protocol

Aseptic sample handling procedures are very similar to requirements for samples to be sent to an analytical laboratory for contaminant analysis. **The required sample volume is 40 to 100 ml.** If obtainable, duplicate samples are requested.

Aseptic Microbial Sampling Guidelines

1. Preserve sample integrity by avoiding skin contact with the interior of the sterile sample container and the sample. The use of sterile, disposable, latex gloves is recommended. Fresh gloves should be put on immediately before manipulating the bailer or sample container.
2. Avoid contact of the sample with water or soils from other parts of the site.
3. Minimize open air exposure of the sample container and sample.
4. Do not use a soiled or dirty wipe cloth to dry equipment used for sampling. The use of a clean, previously unexposed section of paper toweling is acceptable.
5. Minimize head space in the sample container by filling full with sample.
6. Between samples, stainless steel bailers should be:

   A. Washed with water containing a mild detergent (Alconox®) and 4 oz. of bleach per 5 gal. of water
   B. Rinsed 3X with clean water
   C. Dried using clean paper toweling
   D. Sprayed with 70% isopropyl (rubbing) alcohol
   E. Dried using clean paper toweling.

   Steam cleaning is also a suitable sanitizing method. As above, equipment should be dried using clean toweling prior to use.
7. If using a disposable bailer for sample collection, use a clean one for each separate sample. The same bailer may be used for collection of duplicate samples if care is taken not to touch areas contacted by sample.

Sample Storage Prior to Delivery to BTI

1. Use waterproof tape to seal the sample container, so as to prevent sample leakage, and place in a ziplock® bag.
2. Samples should be packed on ice at all times, including during shipment. **Do not freeze samples.** The use of "blue ice" is not encouraged.
3. Samples should be shipped to arrive at BTI within 24 hours of sampling.

The Faraday Center ♦ 2800 South Fish Hatchery Road ♦ Madison, Wisconsin 53711 ♦ (608)276-8980 ♦ Fax: (608)273-6989

Comparative Microbiological Enumeration Assay

Soil Sampling Protocol

Aseptic sample handling procedures are very similar to requirements for samples to be sent to an analytical laboratory for contaminant analysis. **The required sample amount is 4 ounces.** If obtainable, duplicate samples are requested.

Aseptic Microbial Sampling Guidelines

1. Preserve sample integrity by avoiding skin contact with the interior of the sterile sample container and the sample. The use of sterile disposable latex gloves is recommended. Fresh gloves should be put on immediately before manipulating the sample.
2. Split spoon cores should be dissected so as to remove the disturbed top and bottom portions, using an alcohol-sterilized spatula.
3. Avoid contact of the sample with soils from other parts of the site.
4. Minimize open air exposure of the sample container and sample.
5. Do not use a soiled or dirty wipe cloth to dry equipment used for sampling. The use of a clean, previously unexposed section of paper toweling is acceptable.
6. Minimize head space in the sample container by filling full with sample.
7. Between samples, equipment contacting the sample should be:

   A. Washed with water containing a mild detergent (Alconox®) and 4 oz. of bleach per 5 gal. of water
   B. Rinsed 3X with clean water
   C. Dried using clean paper toweling
   D. Sprayed with 70% isopropyl (rubbing) alcohol
   E. Dried using clean paper toweling.

   Steam cleaning is also a suitable sanitizing method. As above, equipment should be dried using clean toweling prior to use.

Sample Storage Prior to Delivery to BTI

1. Use waterproof tape to seal jar lid interface, and place in a ziplock® bag, to prevent sample leakage or saturation if exposed to water during shipment.
2. Samples should be packed on ice at all times, including during shipment. **Do not freeze samples.** The use of "blue ice" is not encouraged.
3. Samples should be shipped to arrive at BTI within 24 hours of sampling.

RE: Pressed Steel Tank Inc.

Dear Chip:

This letter is to update you regarding the status of the investigation at Pressed Steel Tank Inc., located at 1445 South 66th Street, West Allis, Wisconsin. Following the November, 1992 groundwater sampling of the existing wells, six groundwater monitoring wells were installed to determine the extent of groundwater contamination. Details of the borehole sampling, well construction and well development will follow in a Remedial Investigation/Feasibility Study Report in approximately four months. A Work Plan for the Feasibility Study will be forwarded to you in approximately four weeks. The Work Plan will outline the tasks necessary to determine the feasibility of remedial methodologies.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

Geof Parish
Hydrogeologist

RE: Pressed Steel Tank Water Sampling

Dear Mr. Krohn:

In regard to your letter dated June 3, 1992, wherein you rejected the recommendation contained in the GAS remedial investigation progress report, GAS has reviewed and reevaluated the existing available data. The existing groundwater monitoring wells at Pressed Steel Tank 1445 South 66th Street site were sampled and the samples analyzed at a state of Wisconsin Certified Laboratory, NET Midwest, for volatile organic compounds (VOCs) and Gasoline range organics (GRO). This letter is to serve as notification of the results of the sample analysis.

Monitoring wells MW-1 through MW-6 were sampled on November 9 and 10, 1992. Water sampling logs and laboratory reports are attached to this letter. Enforcement standards were exceeded in MW-1, MW-2 and MW-5. No contaminants were detected in MW-3, MW-4 and MW-6 (please see the attached table).

After the groundwater sample results were analyzed, the locations of five additional water table wells and one piezometer were determined to define the extent of petroleum and VOC contamination.

A full report, Remedial Investigation\Feasibility Study (RI/FS) documenting the results of borehole samples and analysis, monitoring well installations, developments and sampling, discussions of the feasibility of remedial options and recommendations for remediation will follow in approximately four months. Following WDNR approval of the chosen remedial option, a Remedial Action Plan will be developed that describes the remedial system, sampling protocol, sampling frequency, and cleanup criteria.

If you have any questions or require additional information please call us at 256-4060.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

P.O. Box 10
Milwaukee, WI 53201

RECEIVED
NOV 13 2000
By

Dear Mr. Finch:

The Division for Environmental Quality is conditionally approving plans and specifications for a wastewater pretreatment system to serve Pressed Steel Tank Company, Inc., at Milwaukee, Wisconsin. The pretreatment system will discharge wastewater to the MMSD sanitary sewerage system. The plans and specifications submitted by John A. Cimermancic were received for approval on July 3, 1992.

The pretreatment plans were prepared by Triad Engineering Incorporated, Milwaukee, Wisconsin. A copy of the design report is attached.

The proposed pretreatment modification to the existing process will consist of the following steps:

1. Manual acidification of the spent dilute chromic acid (from the existing sealer tank and the new rinse tank) to a pH of 2.2 and 2.3.

2. Manual addition of sodium bisulfite to reach an oxidation reduction potential of between 22-230 millivolts.

3. Mixing of the new hexaualent chrome batch tank contents for 15-20 minutes.

4. Operator will utilize a portable test kit to check mg/l of hexaualent chromium. If below 4 mg/l, the contents of the batch tank will be transferred to the existing pretreatment process for precipitation, clarification and sludge handling.

The plans and specifications and other reports on file with the Department were used by the Department as the basis for conditional approval.

The plans and specifications are hereby approved in accordance with sec. 144.04, Wis. Stats., as attested by affixing on plans and specifications the stamp of approval, Number 92-1006, subject to the following conditions:

Printed on Recycled Paper

1. That all existing treatment facilities be operated as effectively as possible during the course of the construction period, and the proposed system be operated efficiently when it is placed in operation.

2. That this Division be notified when construction has commenced and again when the facilities are placed in operation.

3. That solid wastes or residuals generated as a result of the wastewater pretreatment process are handled and disposed of pursuant to Chapters 144 and 147, Wis. Stats.; Chapters NR 500 to 520 and 600 to 685, Wis. Adm. Code, and other regulations which apply to the handling of the wastewater pretreatment residues. For more information on these requirements, call Frank Schultz, Southeast District, at (414) 263-8640.

4. That the facility described in the plans and specifications is designed to provide treatment adequate to meet the pretreatment standards published by U.S. EPA for the metal finishing category, 40 CFR, Part 433 and the MMSD sewer use ordinance.

5. That the improvement(s) be installed in accordance with the plans and specifications, and the above conditions, or subsequent essential and approved modifications.

The Department has the authority under subsec. 144.025(2)(c), Wis. Stats., to adopt rules for the construction, installation, use and operation of practicable and available systems, methods and means for preventing and abating pollution of the waters of the state. Chapters NR 108 and 100, Wis. Adm. Code, have been adopted by the Department pursuant to this statutory authority. The Department has the authority to approve, conditionally approve or reject plans under sec. 144.04, Wis. Stats.

This approval shall not be construed as a Department certification of the ability of the proposed system to comply with applicable pretreatment standards. Where necessary, plans and specifications should be submitted to the Department of Industry, Labor and Human Relations, the MMSD or other state or local agencies to ensure conformance with the applicable codes or regulations of such agencies.

The Division reserves the right to order changes or additions should conditions arise making this necessary.

Tangible personal property which becomes part of a waste treatment or pollution abatement plant or equipment, may be exempt from property and sales tax under sec. 70.11(21) and sec. 77.54(26), Wis, Stats. A prerequisite to exemption under this subsection is the filing of a statement on forms prescribed by the Department of Revenue. The forms and instructions may be obtained from the Department of Revenue, Bureau of Property Tax, P.O. Box 3933, Madison, Wisconsin 53708.

If installation of these improvements has not been commenced within two years from this date, this approval shall become void. After two years, therefore, new application must be made for approval of these or other plans and specifications before any construction work is undertaken.

If you believe that you have a right to challenge this decision, you should know that Wisconsin Statutes and administrative rules establish time periods within which requests to review Department decisions must be filed.

For judicial review of a decision pursuant to secs. 227.52 and 227.53, Wis. Stats., you have 30 days after the decision is mailed, or otherwise served by the Department, to file your petition with the appropriate circuit court and serve the petition on the Department. Such a petition for judicial review shall name the Department of Natural Resources as the respondent.

To request a contested case hearing pursuant to sec. 227.42, Wis. Stats., you have 30 days after the decision is mailed, or otherwise served by the Department, to serve a petition for hearing on the Secretary of the Department of Natural Resources. The filing of a request for a contested case hearing is not a prerequisite for judicial review and does not extend the 30-day period for filing a petition for judicial review.

This notice is provided pursuant to sec. 227.48(2), Wis. Stats.

Dear Mr. Julian,

RE: Graef, Anhalt & Schloemer (GAS)
"Remedial Investigation Progress Report" - January 1992

Pressed Steel Tank Property
1445 South 66th Street
West Allis, Wisconsin

This letter is in response to the referenced report which includes recommendations for no further action at the Pressed Steel Tank site.

The Wisconsin Department of Natural Resources hereby rejects the recommendations contained in the GAS report and requests that an alternative proposal be submitted for addressing soil and groundwater contamination.

Sincerely,

Charles J. Krohn
Hydrogeologist

I. INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was retained by Pressed Steel Tank Inc. to complete a Remedial Investigation addressing the subsurface contamination detected during the removal of one 1,000 gallon underground storage tank located at 1445 South 66th Street, West Allis, Wisconsin (Figure 1). This report summarizes work performed from September 1989 to the present. This report attempts to follow the Wisconsin Department of Natural Resources (WDNR) Remedial Investigation guidelines as much as possible.

The scope of site activities consists of the removal of one 1000 gallon tank (performed on 9/19/89). Because contamination was discovered during the tank removal, two sets of soil borings and groundwater monitoring wells were installed to define the extent of soil and groundwater contamination. The first round of monitoring wells, MW-1A, MW-2A, and MW-3A, were drilled in April, 1990 (Figure 2). A second set of soil borings (SB-4 to SB-8) were installed in May, 1991. Three of these soil borings were converted to monitoring wells (MW-4, MW-5, and MW-6).

II. BACKGROUND INFORMATION

4. Site History

Pressed Steel has manufactured steel tanks and various foundry produced products for approximately 100 years.

The 1000 gallon tank removed September 19, 1989 was used as a source of gasoline for in-plant trucks servicing the needs of the factory. The tank reportedly only contained gasoline. No records of inventory or non-operation are available. The tank was never leak tested, repaired, or replaced. The age is unknown, however, it is reported to be older than 30 years.

As no single incident of a significant spill around the tank area was ever recorded, the contamination most likely is a result of small surface spills, leaking piping runs, and/or leaks from the tank itself which accumulated over a long period of time.

There has never been any reports of vapors, odors, or any other signs of contamination in area structures or nearby utilities.

A review of the WDNR's latest spills list, indicated that an unknown quantity of oily waste was reportedly spilled from some liquid waste pits on 7/22/86. The reported location of these pits is in the area of 67th and National (1 block west of the tank location). This location is topographically lower than the tank location so this spill would not appear to have affected the area around the tank.

5. Description of Tank and Soil Removal Activities

On September 19, 1989, a 1,000 gallon underground storage tank was removed at Pressed Steel Tank Inc. The tank excavation was located in a tightly confined area at the far southeast corner of the property near the intersection of 66th Street and National Avenue (Figure 2). The excavation was surrounded on the east and south sides by a security fence, to the west by a retaining wall and a vault for the sprinkler system, and to the north by a concrete drive. The property boundary is two feet outside the fence (Figure 2).

While excavating, a gasoline odor was noticed at a depth of 3.5 feet. The sand backfill was screened with an HNu Model PI-101 photoionization detector (PID) and was found to contain 100+ instrument units (IU) of volatile organic compounds (VOCs). After removal of the backfill, the perimeter soil material was sampled and screened with the HNu. VOC levels ranged from 60 to 208 IU (Table 1).

While excavating along the west side of the tank, a storm sewer lateral was encountered at a depth of 5.0 feet, approximately 1.5 to 2.0 feet west of the tank. While removing the tank, the storm sewer lateral was punctured in two places. The section of sewer piping running through the excavation and the contaminated sand that surrounded it were removed. Stained soil was observed around the sections of sewer lateral that extended to the north and south beyond the excavation.

On September 20, 1989, the contractor (Interstate Pump and Tank) removed the fence around the pit. The pit was excavated to the limits of the property, and to the maximum depth that the contractor's equipment would allow. Final dimensions of the pit were 20.2 feet by 9.0 feet by 8.5 feet deep. The perimeter material was sampled and screened with the HNu. VOC levels were greater than 50 IU. Results of PID field screening of soil samples collected from the excavation are listed in Table 1. Concentrations greater than 100 IU were detected during the initial excavating, then ranged from 50 to 60 IU after over-excavating. VOC field screening concentrations in the base of the excavation increased from 120 IU at 8.25 feet to 242 IU at 12.16 feet.

Approximately 45 cubic yards of contaminated soil was removed and placed on an impermeable layer of plastic on top of the asphalt parking lot across 66th Street. The edges of the plastic were turned up to prevent precipitation run-off from entering the pile. The soil was also covered by an impermeable layer of plastic to prevent infiltration of precipitation and subsequent leaching of contamination.

Laboratory analysis of a composite soil sample had concentrations of 320 ppm TPH, characterized as gasoline, 830 ppb (parts per billion) benzene, 3,500 ppb ethylbenzene, 6,000 ppb toluene, and 31,000 ppb total xylene. Laboratory results from soil samples collected during the tank removal are located in Appendix A. The contaminated soils were transported to Waste Management's Parkview Landfill on December 6 and 7, 1989.

TABLE 1

FIELD SCREENING AND LABORATORY RESULTS FROM TANK EXCAVATION SAMPLES

Pressed Steel Tank
Soil Samples Collected 9/19/89 to 9/21/89

Soil Location	Depth (feet)	Field Screen HNu (IU)
East Wall North	8.0	60
East Wall Center	8.0	150
East Wall South	8.0	175
South Wall East	8.0	120
Sewer Lateral Trench	6.5	20
South Wall West	8.0	208
West Wall South	8.5	60
West Wall Center	8.5	130
West Wall North	8.5	50
East Wall South	8.0	70
East Wall Center	8.0	50
South Wall (Under Sewer Lateral)	7.0	100
South Wall East	8.0	56
North Wall West	8.0	110
North Wall Center	7.0	10
North Wall East	8.0	140
Bottom	8.25	120

Soil Location	Vertical Depth	Lateral Depth	HNu (IU)	Laboratory Sample TPH (ppm)
North Wall	7.0	5.5	42	440
East Wall	7.0	5.33	68	100
South Wall	7.5	5.0	38	24
Bottom	12.16	--	242	28

TPH = Total Petroleum Hydrocarbons - (WDNR Allowable Limit is 10 ppm)
PPM = parts per million
IU = Instrument Units

On September 21, 1989, GAS returned to the site to conduct horizontal borings into the side walls of the excavation. The borings were conducted using a hand-powered bucket auger. A hole was augered into the center of each excavation wall (with the exception of the concrete retaining wall to the west) at a depth of 7.0 to 7.5 feet. Each hole was augered into the side wall 5.0 to 5.5 feet. A sample was taken, and split into equal portions. One portion was screened with the HNu (Table 1), the other was sent to the laboratory for a TPH analysis.

The first hole, Hand Auger 1 (HA-1) was augered in the north wall at a depth of 7.0 feet, 5.5 feet into the side wall of the pit. HNu screening detected 42 IU and lab analysis indicated 440 ppm TPH, characterized as gasoline.

Hand Auger 2 (HA-2) was bored into the center of the east wall at a depth of 7.0 feet. It reached 5.33 feet into the east side of the excavation. The HNu detected 68 IU and lab analysis indicated 100 ppm TPH, characterized as gasoline.

Hand Auger 3 (HA-3) was augered in the center of the south wall at a depth of 7.5 feet, extending 5.0 feet into the wall of the pit. The HNu detected 38 IU and lab analysis indicated 24 ppm TPH, characterized as gasoline.

A test pit was dug along the base of the excavation to determine vertical extent of contamination. The trench was dug to a depth of 12.3 feet with water being encountered at an approximate depth of 12.25 feet. A water sample was not collected because of the questionable validity of the sample. Because of the obvious presence of contamination, the water surrounding this tank would probably have anomalous chemical constituents which were not correlatable to actual groundwater constituent levels. It was also questionable as to whether this was actual groundwater or perched water in the tank backfill. A soil sample was taken just above the water interface at 12.2 feet. The HNu detected 242 IU and laboratory analysis indicated 28 ppm TPH characterized as gasoline. The excavation was backfilled with gravel and covered with topsoil.

Field screening and laboratory analyses of site soil samples indicated the presence of petroleum hydrocarbon contamination above the WDNR allowable limits. In February, 1990, GAS submitted a proposal to the WDNR to investigate site soils and possibly groundwater, if encountered, to define the extent of the contamination detected during the September, 1989 tank removal.

6. Continued Investigations

In April 1990, three soil borings (SB-1, SB-2 and SB-3) were installed (Figure 2). Soil boring logs are located in Appendix B. Soil samples were collected and field screened. Select samples were submitted for laboratory analyses (Table 2 and Appendix C). All three borings were converted to groundwater monitoring wells (MW-1A, MW-2A, and MW-3A). The wells were sampled for volatile organic compounds (VOC's) (Table 3, Appendix D).

Because VOC compounds were detected in each well, Pressed Steel Tank Inc. retained GAS to continue the investigation to define the extent of contamination. In May 1991, five additional soil borings were installed (SB-4 to SB-8) (Figure 2). Three of these borings, SB-5, SB-6 and SB-7 were converted to groundwater monitoring wells MW-4, MW-5 and MW-6. Results from this round of soil sampling are also located in Table 2 and Appendix C. Groundwater sample results are located in Table 3 and Appendix D.

In addition to sampling, monitoring wells were measured for groundwater flow direction. Three monitoring wells (MW-1, MW-2, MW-3) from an earlier Remedial Investigation located 240 feet north (Figure 2), were also measured and the data utilized in determining groundwater flow direction. Figure 3 illustrates the direction of groundwater flow with a calculated gradient in the contamination area of approximately 0.05 feet per foot.

B. Geology

The project site is located in the west-central section of the county within the Lake Border Moraine System. The site is near the crest of a hill that forms a divide between the Kinnickinnic and Menomonee Rivers. The site is in an industrial area with very few permeable areas available for groundwater recharge.

FIGURE 3

1. Soils

Soils in the Pressed Steel Tank Company area are part of the Ozaukee-Morley-Mequon Association (Figure 4). These soils develop in thin layers of loess over silty clay loam glacial till. The site occurs outside of the area of detailed soils series mapping, however, based on topography and soil association, site soils probably consist of silty clay loams developed in tills.

2. Glacial Geology

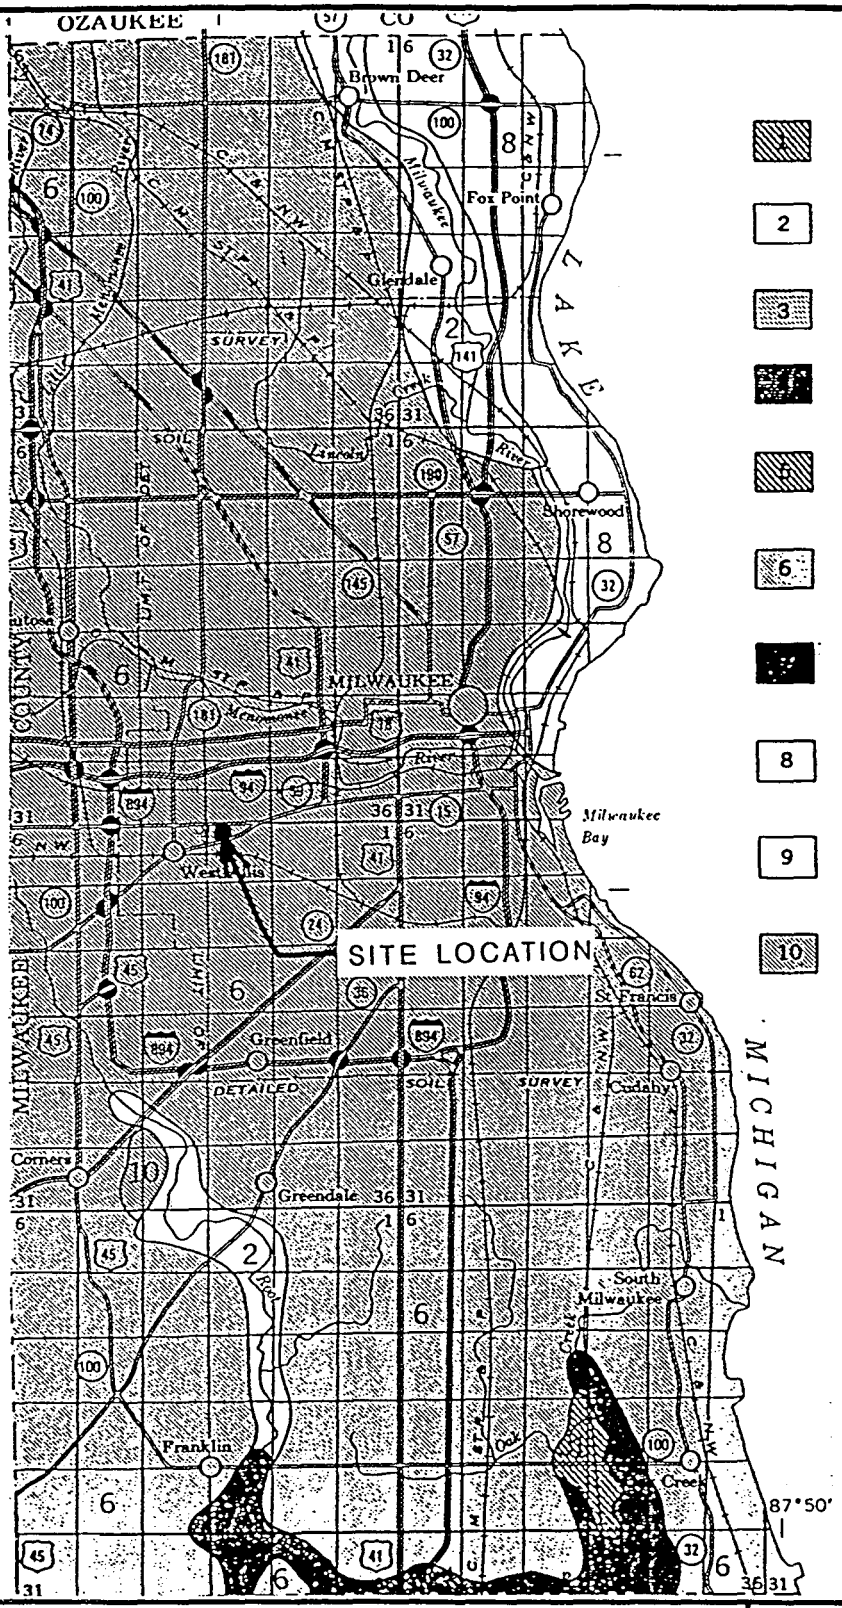
The landforms and surface deposits of Milwaukee County are a result of glaciations during the Woodfordian and Great Lakean phases of the late Wisconsinan Stage (Pleistocene Series time period). A series of recessional moraines, formed by the Lake Michigan Lobe, occur in north-trending ridges throughout the county (Figure 5). Deposits are predominantly tills, with minor areas of outwash deposits in the north, east, and south-central parts of the county. Deposits at the site are tills, based upon maps and soils in the excavation. Estimated thickness of the glacial deposits is 200 feet, based on water well contractor reports.

3. Bedrock

The bedrock units of Milwaukee County are essentially horizontally-bedded Paleozoic sedimentary rock. The northeastern one-seventh of the county is Devonian System dolomites and shales of the Milwaukee Formation (Figure 6). Bedrock in the remainder of the county is Silurian System dolomites. Estimated depth to bedrock at the site is 200 feet below ground surface, based on water well contractor reports.

C. Hydrology

Milwaukee County contains parts of the Oak Creek, Milwaukee, Menomonee, and Root River Watersheds, all of the Kinnickinnic River Watershed, and areas adjacent to Lake Michigan that drain directly into the lake. The Oak Creek, Kinnickinnic and Milwaukee Rivers drain the eastern part of the county, whereas the Root and the Menomonee Rivers drain the western part of the county.



SOIL ASSOCIATIONS

1 Houghton-Palms-Adrian association: Very poorly drained organic soils in depressions on old lakebeds and on flood plains

2 Fox-Casco association: Well-drained soils that have a subsoil of clay loam; moderately deep to shallow over sand and gravel, on outwash plains and stream terraces

3 Warsaw-Lorenzo association: Well-drained soils that have a subsoil of clay loam; moderately deep over sand and gravel, on outwash plains and river terraces

4 Boyer-Oshtemo association: Well-drained soils that have a subsoil of sandy loam and sandy clay loam; underlain by sandy material, on outwash plains

5 Rodman-Casco association: Excessively drained to well-drained soils that have a subsoil of gravelly sandy loam and clay loam; shallow over gravel and sand, on the Kettle Moraine

6 Ozaukee-Morley-Mequon association: Well-drained to somewhat poorly drained soils that have a subsoil of silty clay loam and silty clay; formed in thin loess and silty clay loam glacial till, on moraines

7 Montgomery-Martinton-Hebron-Saylesville association Poorly drained to well-drained soils that have a subsoil of clay to clay loam; formed in silty clay or silty clay loam sediments, in old lakebeds

8 Kewaunee-Manawa association: Well-drained to somewhat poorly drained soils that have a subsoil of clay and silty clay; formed in thin loess and silty clay glacial till, on moraines and in depressed areas

9 Hochheim-Theresa association: Well-drained soils that have a subsoil of clay loam and silty clay loam; formed in thin loess and loam glacial till, on ground moraines

10 Pella, moderately shallow variant-Knowles association: Poorly drained and well-drained soils that have a subsoil of silty clay loam or clay loam; moderately shallow over dolomite bedrock

FIGURE 6

Pressed Steel Inc. is located within and near the southern boundary of the Menomonee River Watershed. The boundary with the Kinnickinnic River Watershed occurs along National Avenue in the area of the investigation site. Run-off at the site is expected to be intercepted by storm sewers.

A hydrological budget for Milwaukee County from the U.S.G.S. Hydrological Atlas, based on climatological and environmental data from 1931 to 1960, may be summarized as follows. An average of 29 to 31 inches of precipitation falls on the county. Eight inches of intercepted precipitation leave the county as runoff, and 20 to 23 inches leave as evapotranspiration. Two-tenths of an inch are accounted for as pumpage and groundwater flow out of the county. On average there is no net change in storage calculated for the county. However, there are areas in Milwaukee where significant losses in storage are occurring.

D. Hydrogeology

Milwaukee County's hydrogeology is dominated by three aquifers: two bedrock aquifers in Paleozoic sedimentary rock, and a sand and gravel aquifer in unconsolidated outwash deposits.

1. Bedrock Aquifers

The deep bedrock aquifer is predominantly Cambrian and Ordovician sandstones and some dolomites, and is generally referred to as the sandstone aquifer. Throughout the county, the sandstone aquifer is confined by an aquiclude, the Ordovician Maquoketa Shale. The aquifer is used for high-yield industrial and private wells.

The shallow bedrock aquifer, the Silurian dolomite aquifer, occurs throughout the county. The aquifer, either by itself or in hydraulic connection with the overlying sand and gravel aquifer, forms the water table aquifer and is used for shallow, industrial, and private wells.

The sandstone aquifer is recharged from four sources. The first is leakage of groundwater from overlying aquifers through the intervening aquiclude, the Maquoketa Shale. Leakage occurs where the shale is thin, fractured, or interbedded with more permeable units. The second source of recharge is through uncased wells that tap both the dolomite and the sandstone aquifers. Flow of water from the dolomite to the sandstone occurs because of the greater hydraulic head in the dolomite aquifer. The third source of recharge occurs where the dolomite aquifer and the Maquoketa Shale are missing, and groundwater from sands and gravels or precipitation infiltrates into the sandstone. The fourth source of recharge is infiltration of lake or river water into the sandstone aquifer. The third and fourth sources of recharge occur west of Milwaukee County, but are the most significant sources of recharge to the aquifer.

2. Glacial Aquifer

The glacial aquifer is in sands and gravels deposited by Pleistocene ice sheets in spatially discontinuous outwash deposits throughout Milwaukee County. The aquifer is tapped for low yield private and industrial uses.

In Milwaukee County, the sand and gravel and the dolomite aquifers are recharged with waters from rivers and lakes. Depending on changing climate and seasonal weather patterns, recharge occurs where and when there is a net influx of water to an aquifer. More significantly, however, are areas where sands and gravels or dolomites are at or near the surface, and infiltration of precipitation may occur directly through higher permeability soils.

The sand and gravel and the dolomite aquifers discharge to streams, inland lakes and Lake Michigan, where and when the net effect of changing weather and climate conditions and aquifer use is an outflux of water. Other discharge areas occur where water is lost through uncased wells and leakage through the Maquoketa Shale to the sandstone aquifer. Additionally, municipal wells, industrial parks, and quarry operations can cause significant discharge areas. The only significant discharge areas of the sandstone aquifer result from high capacity wells.

A selection of water wells located in the Pressed Steel Inc. area are depicted on Figure 7. Water well contractor reports for these wells are contained in Appendix E.

III. RISK ASSESSMENT

Numerous utility lines lie within the area of contamination (Figure 2). Because the site soils consist mainly of clays, these utility lines could act as a less resistive pathway for contamination migration. The most likely utility line which could act as a conduit pathway would be the storm sewer which was located immediately adjacent to the underground storage tank. This is the utility line which was ruptured during the tank removal. Contaminated soil was located around sections of the sewer lateral which extended north and south beyond the excavation limits. Also, two large buildings lie adjacent to the area of contamination. The location of any subsurface drainage tiles lying adjacent to the two buildings is unknown but could present a pathway for contaminant migration should they be present. Basements do not exist beneath the two buildings. Construction records are not available for these buildings, however, there is the possibility of a gravel underlayment beneath the buildings which could act as a migration pathway for contamination.

A more permeable soil lens of silty sands appears to be continuous from SB-4 to MW-2A to MW-3A (Figures 2 & 8). This silty sand layer appeared in each of these borings, ranging in depth from 9 to 10 feet bgs in SB-4 and MW-2A to 16 to 22 feet in MW-3A. This sandy layer was not encountered in soil borings SB-5 and SB-6, located south of National Avenue, so it is unlikely that this layer would act as a southerly migration pathway. However, eastern or western contaminant migration through this layer is a possibility. Groundwater movement through the clay is very slow due to the "tight" nature of the soils, therefore, the contamination located in the clays would not appear to present a high migratory risk.

A. Potential Receptors of Contamination

There are a few industrial supply wells located within a one-half mile radius of the site, however, they are all cased at least 100 feet bgs and would not appear to be threatened by the contamination at Pressed Steel.

FIGURE 8

Buildings on site are of a heavy industrial nature built on 14 inches of concrete and do not contain basements. The remaining contamination located in the tight clays and thin sand seams does not appear to present a major health risk to the personnel working at Pressed Steel.

The closest residential basements are located approximately 80 feet from the tank excavation. Soils between the former source and these residences consist mainly of tight clays. Various utility lines also are located between the source and the basements which may act as a boundary for contaminant migration (Figure 3).

B. Potential Health Risks

Because the contamination lies within tight clays which are covered by 14 inches of concrete, human exposure risks are minimal. If subsurface utility work is ever performed in this area, however, there would be possible exposure to workers if contamination has migrated to the less resistant material surrounding these utilities.

The threat to area supply wells is minimal due to the low hydraulic conductivity of the site soils and because the area supply wells are cased over 100 feet bgs.

IV. RESULTS

Tables 1 to 3 summarize the field screening and laboratory results from all soil and groundwater sampling events.

Based on laboratory analyses, soil contamination appears to be limited to the area designated on Figure 9. Appendix A contains the laboratory reports from soil samples collected during the tank removal, and Appendix C contains laboratory reports from soil samples collected during the soil boring events.

Groundwater, located at approximately 4 feet bgs, appears to be contaminated in the area illustrated on Figure 10. This conclusion is based on laboratory results from two groundwater sampling events conducted in May, 1990 and May, 1991 (Appendix D).

A. Sampling Methods Used

The following descriptions represent the soil sampling procedures which were followed for both boring events:

Soil borings were drilled with a Central Mining Equipment Model 45 truck mounted drill rig using 4.25-inch inner diameter hollow stem augers. For each sample interval, a split-spoon was driven through the lead auger, the spoon removed, the auger closed, and the hole bored to the base of the sampled interval. After the sample was removed, the spoon was washed with trisodium phosphate (TSP), double rinsed with potable water, and assembled for the next sample interval.

Each split spoon sample was separated into two equally representative portions. One portion was packed tightly into 4-ounce glass jars with teflon-lined lids and packed on ice to preserve the sample for possible laboratory analysis. The second portion was placed into 8-ounce glass jars, covered with aluminum foil and capped. These samples were allowed to warm up to approximately 70°F for at least 20 minutes before they were field screened.

Field screening of the soil samples was performed by removing the cap from the 8-ounce jar and inserting the probe of a photoionization detector (PID) through the aluminum foil seal into the headspace of the jar. Samples were screened in a location which was isolated from as many potential VOC sources as possible. Any background levels of VOC's were noted and subtracted from the PID readings.

Two types of PID's were used for field screening. During the April 17, 1990 boring event, an HNu Model PI-101 PID with a 10.6 electron volt lamp was used. On May 3, 1991 boring samples were field screened using a Thermo Environmental Instruments Inc., Model 580B Organic Vapor Meter (OVM) equipped with a 10.6 electron volt lamp. PID's were calibrated to 100 ppm isobutylene at the start of each day. The PID's were periodically checked during the day for calibration.

B. Abandonment Methods

All soil borings were abandoned by completely filling the hole with bentonite chips, then sealed with asphalt patch or concrete, flush with grade. Abandonment forms are located in Appendix F. Soil boring cuttings were placed into 55-gallon drums and stored on site.

C. Monitoring Well Installation and Sampling

All soil borings which were not abandoned were converted to groundwater monitoring wells. Wells were constructed in accordance with Chapter NR 141 of the Wisconsin Administrative Code.

Groundwater monitoring wells MW-1A, MW-2A, and MW-3A were installed into soil borings SB-1, SB-2, and SB-3 on April 17, 1990. Monitoring wells MW-4, MW-5, and MW-6 were installed into borings SB-5, SB-6 and SB-7, respectively, on May 17, 1991. All monitoring wells were constructed of 2-inch diameter Schedule 40 PVC pipe. All well screens were 10 feet in length with 0.010 inch slots, except for MW-4 which has a 15 foot screen, and MW-5 which has a 5-foot screen.. The 15-foot length of screen was chosen in MW-4 because of the uncertainty of the water table depth during the installation. The hydraulic conductivity of the tight clay at this location made it difficult to determine exact depth to groundwater so a 15-foot screen was used to insure that the water table would be intersected. A 5-foot screen was used in MW-5 because the soil boring was advanced to 8.8 feet bgs and discontinued because of drilling problems (an obstruction) and groundwater had been encountered in nearby wells at approximately 3 feet bgs. Well screens were packed with silica sand to two feet above the screens. Granular bentonite was used to seal the wells to one foot bgs. Concrete was used as a surface seal. Because the wells were located in areas of vehicle traffic, they were installed below grade and capped with flush-mount protective covers. Appendix G contains well construction forms.

D. Well Development

All wells were developed to remove any fine-grained sediments which may have entered the well screen during installation. The wells were developed using teflon or PVC bailers. See Appendix G for well development forms. All wells were able to be purged dry. All water removed during development and sampling was placed in 55-gallon drums and stored on site.

Water level measurements were obtained using an electric water level indicator. Approximately five days after well development, water samples were collected from the wells. Each well had dedicated rope to lower and raise the corresponding bailer, which was also used to collect water samples. Groundwater samples were placed in a 40-milliliter volatile organic analysis (VOA) vial and stored on ice, as indicated on the water sampling logs in Appendix H. All samples were sent with a chain-of-custody document to a State of Wisconsin certified environmental laboratory, and analyzed for VOC's. The results of the groundwater analyses are illustrated in Table 3.

Measurements of pH, specific conductivity, and temperature were also recorded from each groundwater sample as well as color, odor, and appearance (Appendix H). Laboratory analysis of a field blank was included as a quality assurance/quality control measure. A field blank was collected during well sampling. Distilled water poured through the decontaminated PVC bailer comprised the field blank.

E. Survey Methods

A total station and data collector was used to obtain topographic information of the monitoring wells and the other borings. Three elevations were taken at the north side of the monitoring well: top of the protective pipe, the top of the PVC, and the ground surface elevation. Water table elevations were also taken from the north side of the PVC. The survey data and groundwater elevations from the four monitoring wells were used in determining groundwater flow direction and horizontal gradient. Refer to Figure 3 for the groundwater elevation contour map. In addition to well elevations, lateral distances were also surveyed.

F. Slug Test Data

On June 14, 1991, a bail-down test was performed in wells MW-1 and MW-2. This test was performed in order to obtain hydraulic conductivity values of the soils surrounding these wells.

The bail down test procedure was as follows: the wells were bailed down until dry or until a minimal amount of water was remaining in the well casing. At this point, a pressure transducer was inserted into the well and the water level measured. The pressure transducer monitors the water level by the difference in pressure caused by the difference in the height of the water column. The transducer was connected to a SE 200B data logger which printed out time versus height of water column.

The received data (head ratio and time) were then plotted on semilogarithmic graph paper to produce a graph (Appendix I). These plots were accomplished using the Bouwer, Rice slug test method for unconfined aquifers with partially penetrating wells. Geraghty & Miller Inc. AQTESOLV computer program was the software used for plotting these graphs.

The resulting hydraulic conductivity values (K) were 1.77×10^{-6} ft/min for MW-1 and 1.02×10^{-6} ft/min for MW-2. These results correlate with site soils and field observations in that groundwater flow is very slow at this site and thus migration potential in these soils is minimal.

V. DISCUSSION

A. Extent of Soil Contamination

Based on field screening and laboratory analyses results of soil samples collected during the tank assessment and two soil boring events, gasoline contamination appears to be limited to the area illustrated on Figure 9. Additional compounds are present beyond the area illustrated by Figure 9, but these compounds are not found in gasoline and therefore probably were introduced into site soils from another source. Soil

boring samples that detected TPH concentrations characterized as gasoline were SB-2 (550 ppm) at 7-9 feet, and SB-4 (470 ppm) at 3-5 feet. Soil samples submitted from SB-4 at 21-23 feet and 13-15 feet in SB-4, registered no detect. Residual contamination remains in the excavation walls and floor based on results from soil samples collected during the tank removal assessment. Results from all other soil boring samples submitted to the laboratory registered no detect.

B. Extent of Groundwater Contamination

Based on laboratory analysis results from groundwater sampling, contaminated groundwater exists in the area illustrated in Figure 10. Table 3 summarizes the concentrations of various compounds detected in MW-1 through MW-6. Various VOCs were detected at wells MW-1A and MW-5, yet these VOCs are probably not the result of use of the petroleum tank system, whereas at wells MW-2A, MW-3A, and MW-4, petroleum volatile organic compounds were detected. The highest levels occurred at MW-2A where benzene, ethylbenzene, toluene and xylenes were detected at levels above the WDNR Enforcement Standard (ES) and Preventive Action Limit (PAL). In MW-3A only the level of xylenes were above the PAL; in MW-4 the xylene levels were less than in the field blank sample (lower by a factor of 10). Accordingly, the contamination detected in MW-4 may have been the result of insufficient cleaning of the sampling bailer.

C. Difficulties Encountered During the Investigations

The development and sampling of MW-5 was difficult because of the extremely slow recharge rate of this well. This well contained approximately one foot of groundwater three weeks after its installation. Distilled water was added to enable purging and surging of the well. After two surge and purge events, the well was bailed dry. A grab sample was collected and submitted for a VOC analysis once enough water accumulated in the well to collect. See Appendix G for the well development form from MW-5 which describes the procedure in detail. Realistic water elevations were recorded after allowing the well to recharge for 5 weeks after sampling.

VI. CONCLUSIONS

Gasoline contamination of site soils and groundwater occurred as a result of the operation of an underground gasoline storage tank. The presence of volatile compounds which are not found in gasoline indicates another source has possibly introduced organic contaminants into the soil and groundwater. The surface beyond the area excavated during the tank removal, where soil contamination was found, is covered with pavement. In addition, sub-surface sediments away from the building are clays, and thus little infiltration of precipitation should occur. Water moves very slowly through clays and accordingly, contaminated water should not migrate very far.

The water table probably has a local mounding in the area of the tank excavation because of the higher hydraulic conductivity of the backfill. Similarly, a mounding would have occurred when the tank was in place. A sand layer was encountered at approximately the same elevation in boreholes for MW-2A and MW-3A and borehole SB-4. Transport of contaminants to the area of MW-3A would have been accelerated by the sand layer. Contaminants from the tank area could have been transported toward the areas of MW-2A and MW-3A. Petroleum groundwater contamination does not extend to the areas of MW-1, MW-4, MW-5, or MW-6; wells where the sand layer was not encountered. Therefore, it appears that contamination migration has followed the path of least resistance and traveled through more permeable material. Groundwater flow direction (Figure 3) generally flows south, however, the migratory path of contaminants flows northeast and northwest. The topography of the area (the tank was at a topographic high) also supports the possibility of contaminant transport in the upgradient direction.

VII. RECOMMENDATIONS

Because of the limited extent of soil contamination, the low hydraulic conductivity of the soils, and pavement cover over the soils, it is recommended that the contaminated soils be allowed to passively remediate through natural processes.

BOREHOLE ABANDONMENT

Wis. Adm. Code (NR 141, NR 812, & NR 341) requires well owners to permanently abandon unused wells/drillholes/boreholes on their property. The reasons for this requirement are:

- To prevent contamination from entering the well/drillhole/borehole at the surface or through corroded well casings and moving downward to an aquifer used by other wells, and

- To prevent vertical movement of water between different geologic formations of differing water quality.

Most licensed well drillers and pump installers have the equipment, knowledge and experience needed to permanently abandon wells/drillholes/boreholes. We recommend that these licensed contractors be hired to do this work.

PROCEDURE

1. Remove any pump, pump piping, debris or other obstacles that could interfere with the sealing operation. In most situations the well casing should be left in place. When the casing is removed it should be pulled during the abandonment process so the drillhole does not collapse.

2. [illegible] pipe [illegible] pumping [illegible] and where approved [illegible].

3. The bottom end of the conductor pipe must initially reach the bottom of the well and must be kept submerged in the sealing material as it is placed.

4. Unconsolidated formation wells should be sealed with the materials listed in item (6) on the form. When clay or sodium bentonite slurry is used to fill wells, the top 20 feet must be sealed with neat cement grout, concrete grout, concrete, or bentonite chips. Bedrock formation wells should be filled with neat cement grout, concrete grout or concrete. Monitoring wells must be filled with the materials specified by NR 141, Wis. Adm. Code.

5. Fill the entire well column from the bottom to the top with the required sealing material.

6. Any standing water in the hole will be forced out by the concrete or cement grout (it is more dense) resulting in an entire column of cement to seal the well. The sealing material must flow at the surface with the same consistency as it is being pumped in.

7. The casing may be cut off several feet below the ground surface.

8. To abandon flowing wells, the flow must be stopped or greatly reduced. This can be accomplished by extending the well casing to an elevation higher than the artesian head, or inserting a seal or packer in the casing. Once the flow has been stopped or reduced, the well can be abandoned the same as other wells.

9. For a municipal well, information regarding drillhole diameter and depths and geologic formations should be submitted on a separate sheet.

10. For use of alternative methods and materials, especially for deep, multi-formation wells contact DNR.

TEMPORARY ABANDONMENT

- A well may be temporarily abandoned if it is planned to place the well back in service within a time specified by administrative rule.
- Temporary abandonment is accomplished by threading or welding a watertight cover to the casing or by filling the well with a clean clay slurry and then placing a cover over the well.
- If the well is not placed back into service, it should be permanently abandoned unless a written extension is granted by DNR.

REPORT TO DNR

The Well/Drillhole/Borehole Abandonment Form 3300-5B, on the front, must be completed by the owner (or agent) and submitted to the appropriate DNR district office or delegated county office within 30 days.

This form is authorized by chapters 144, 147 and 162, Wis. Stats. Completion of this report is mandatory. Penalties: Forfeit not less than $10.00 nor more than $5,000.00 for each violation. Fined not less than $10.00 or more than $100.00 or imprisoned not less than 30 days, or both for each violation. Each day of continued violation is a separate offense, pursuant to ss. 144.99 and 162.06, Wis. Stats.

Additional comments on development:

On 5/17/91, no water was present. The well was installed on 4/17/91. On 5/29/91, one foot of water was removed. After one hour there was zero recharge. One gallon of distilled water was added and the well purged and bailed dry. After ½ hour, zero recharged. Two gallons distilled water were added, purged and removed. After ½ hour there was zero recharge. On 6/28/91 there was 2.7 feet of water in the well so it was sampled without bailing.

James Julian
Maintenance Supervisor
Pressed Steel Tank Co. Inc.
1556 South 66th Street
Milwaukee, WI 53214

Dear Mr. Julian:

RE: PECFA Form 4 Submittal
Pressed Steel Tank
Milwaukee, Wisconsin

Enclosed please find an executed copy of the referenced PECFA Form 4 for the referenced site. Based on information contained in the GAS Inc. Phase II report dated August, 1990, investigation and initial limited soil excavation were done according to WDNR rules and regulations.

The plume has not yet been defined and therefore a remedial action plan has not been submitted. Additional work will be required to properly define the adsorbed phase and dissolved phase plume before a remedial alternative can be selected for the site.

The existence of halogenated hydrocarbons in groundwater may be from a source which is not eligible for PECFA reimbursement. DILHR will make a determination on the suitability of a progress payment and the eligibility of costs which may be related to investigation of contamination not associated to an eligible underground storage tank.

Sincerely,

Charles J. Krohn
Hydrogeologist

FORM 4
DNR SITE INVESTIGATION AND REMEDIAL ACTION PLAN REVIEW

Safety and Buildings Division
Bureau of Petroleum Inspection and Fire Protection
P.O. Box 7969
Madison, WI 53707
(608) 267-4545
(608) 267-7538

Section 101.143 (3) (c) 4, Wis. Stats., requires that a claimant obtain written approval from the Department of Natural Resources (DNR) when requesting reimbursement for activities in response to a discharge from a commercial petroleum product storage system or home oil tank. The DNR approval must indicate that the site investigation and remedial action plan is adequate to meet requirements of s. 144.76, Wis. Stats. The DNR approval is created for the purpose of meeting the requirements of s. 101.143 (3), Wis. Stats., only and does not bar the DNR from requiring that additional investigation and/or remediation activities be performed by persons responsible under s. 144.76, Wis. Stats.

Post Office Box 12436
Milwaukee, Wisconsin 53212

Dear Mr. Krohn:

Graef, Anhalt, Schloemer & Associates Inc., was contracted by Pressed Steel Tank Inc., to perform an environmental investigation of possible soil and groundwater contamination resulting from a petroleum underground storage tank located at 1445 South 66th Street, West Allis, Wisconsin. The tank and a limited amount of contaminated soils were disposed (initial Site Assessment Report). Three soil borings were drilled and monitoring wells installed during an initial phase of investigation of the vertical and lateral extent of soil and groundwater contamination. Groundwater and soil contamination were encountered and accordingly, an additional investigation was planned.

Mr. Mike Strazelic, Comptroller, Pressed Steel Tank Inc., asked that a partial payment be applied for. Accordingly, we are asking for approval of a partial payment for removal of contaminated soils and also other investigative measures to date.

Sincerely,

GRAEF, ANHALT, SCHLOEMER

Post Office Box 12436
Milwaukee, Wisconsin 53212

Dear Mr. Krohn:

Graef, Anhalt, Schloemer & Associates Inc., was contracted by Pressed Steel Tank Inc., to develop and perform a subsurface investigation of possible soil and groundwater contamination at the Pressed Steel Tank property at 1445 South 66th Street, West Allis, Wisconsin. An initial set of soil borings and monitoring wells detected soil and groundwater contamination. However, the extent of contamination was not determined.

Four soil borings and four monitoring wells are proposed to further define the lateral and vertical extent of contamination (Exhibit A).

Soil samples from soil borings will be field screened for VOCs. Soils samples will be collected from the interval with the highest VOC level and the end of a boring. Samples will be submitted to state certified laboratory and analyzed for total petroleum hydrocarbons (TPH) and benzene, toluene, ethylbenzene, and xylenes (BTEX).

Monitoring wells will be developed and sampled. The samples will be submitted to a state certified laboratory and analyzed for VOCs, and total organic carbons (TOC). Development water will be drummed and stored on site or future disposal, pending the results of laboratory analysis.

The results of the soil borings and monitoring well investigation will be presented in a report format and submitted to the Wisconsin Department of Natural Resources. Recommendations for any further action will be based on investigations to that date.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

Dear Mr. Julien,

RE: Phase III Contaminant Investigation
Pressed Steel Tank

The referenced G.A.S. report indicates that both petroleum and solvent contamination exists on Pressed Steel Tank property. Contaminant levels exceed the State Groundwater Enforcement Standards for xylenes, methyl chloride, trichloroethene, and 1,1-dichloroethene.

Pressed Steel Tank will be responsible for determining the horizontal and vertical extent of both soil and groundwater contamination for the listed parameters detected during the phase three investigation.

Please have your consultant submit a short workplan for both further assessment and proposed remedial action.

Sincerely,

Charles J. Krohn
Hydrogeologist

FACILITY DESCRIPTION ABSTRACT

Project Contact:	Mr. James Julien, Manager of Facilities, Maintenance, and Environment 1445 South 66th Street West Allis, Wisconsin 53214
Site Address:	1445 South 66th Street West Allis, Wisconsin 53214
Site Description:	NW1/4, NE1/4, Section 3, T6N, R21E, Milwaukee County
Type of Operation:	Company Fuel
Tank Excavation:	One 1,000 gallon gasoline tank

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was contracted by Pressed Steel Tank Inc. to perform an investigation of possible soil and groundwater contamination resulting from the operation of an underground petroleum storage tank at 1445 South 66th Street, West Allis, Wisconsin (Figure 1).

BACKGROUND

On September 19, 1989, a 1,000-gallon underground regular gasoline storage tank was removed at Pressed Steel Tank Company Inc. The tank excavation was located in a tightly confined area at the far southeast corner of the property near the intersection of 66th Street and National Avenue. The excavation was surrounded on the east and south sides by a security fence, to the west by a retaining wall and a vault for the sprinkler system, and to the north by a concrete drive. The property boundary is two feet outside the fence (Figure 2).

During excavation, a gasoline odor was noticed at a depth of 3.5 feet. The sand backfill was screened with an HNu Model PI-101 photoionization detector and was found to contain 100+ ppm (parts per million) of volatile organic compounds (VOCs). After removal of the backfill, the perimeter soil material was sampled and screened with the HNu. VOC levels were 60 to 208 ppm.

While excavating along the west side of the tank, a storm sewer lateral was encountered at a depth of 5.0 feet, approximately 1.5 to 2.0 feet west of the tank. While removing the tank, the storm sewer lateral was punctured in two places. The section of sewer piping running through the excavation and the contaminated sand that surrounded it were removed. Stained soil was observed around the sections of sewer lateral that extended to the north and south beyond the excavation.

On September 20, 1989, the contractor removed the fence around the pit. The pit was excavated to the limits of the property, and the maximum depth the contractor could reach. Final dimensions of the pit were 20.2 feet by 9.0 feet by 8.5 feet deep. The perimeter material was sampled and screened with the HNu; VOC levels were greater than 50 ppm.

FIGURE 2

Approximately 45 cubic yards of contaminated soils were stockpiled in the staging area. The soils were placed on an impermeable layer of plastic on top of the asphalt parking lot across 66th Street. The edges of the plastic were turned up to prevent precipitation run-off from entering the pile. The soil was also covered by an impermeable layer of plastic to prevent infiltration of precipitation and subsequent leaching of contamination.

Laboratory analysis of a composite soil sample had concentrations of 320 ppm TPH, 830 ppb (parts per billion) benzene, 3,500 ppb ethylbenzene, 6,000 ppb toluene, and 31,000 ppb total xylene. These results are further evidence of soil contamination occurring at the site.

On September 21, 1989, holes were augered into the center of each excavation wall (except the retaining wall) to a distance of 5.0 to 5.5 feet, at a depth of 7.0 to 7.5 feet. Samples were taken, screened with the HNu and sent to the laboratory for analysis of total petroleum hydrocarbons (TPH). Also, a test pit was dug in the base of the excavation. Water, possibly groundwater, was encountered at a depth of 12.5 feet. However, no sample was collected because of the questionable validity of the samples; water ponded in the sediments surrounding a tank would probably have anomalous chemical constituents levels that are probably uncorrelatable to groundwater constituent levels. A soil sample was taken, field-screened, and sent to the laboratory for analysis of TPH. Photoionization detector field screening for VOCs measured concentrations greater than 100 ppm in the initial excavation, from 50 to 60 ppm after overexcavation, and 28 to 63 ppm at a distance of five feet into the walls. VOC concentrations in the base of the excavation increased from 120 ppm at 8.25 feet to 242 ppm at 12.16 feet (Appendix A).

Soil samples collected from a distance of five feet into the walls contained from 24 to 440 ppm gasoline (laboratory interpretation of samples) and a sample from the base of the excavation contained 28 ppm gasoline.

SCOPE OF WORK AND OBJECTIVES

During this phase of investigation, the extent of study included three soil borings and three monitoring wells (Figure 2). Soil borings were drilled to determine the degree

and extent of soil contamination. Monitoring wells were constructed to sample groundwater in order to determine whether on-site groundwater was contaminated.

METHODS OF INVESTIGATIONS AND FIELD OBSERVATIONS

Every attempt was made to locate soil borings where subsurface conditions could best be documented. However, subsurface conduits, structures, and property boundaries restricted the location of boreholes.

Soil boring and monitoring well construction began on April 17, 1990, and continued through April 18, 1990 (Appendices B and C). Three soil borings (Figure 2) were drilled with a Central Mining Equipment Model 45 truck-mounted drill rig, using 2.75 inch inner diameter hollow stem augers. Soil samples were collected continuously using split spoon samplers. For each sampling interval, a split spoon was driven through the lead auger, the spoon removed, the auger closed, and the hole bored to the base of the sampled interval. After a sample was removed, the spoon was washed with TSP, double rinsed with potable water, and assembled for the next sample interval.

Each sample was split approximately in half and placed in Ziploc plastic bags. The first half was bagged and placed in a cooler in order to preserve the sample for possible laboratory analysis. The second half, enclosed in a Ziploc plastic bag, was allowed to reach room temperature and was then field screened for volatile organic compounds (VOCs). Samples were field screened with an HNu brand Model PI-101 photoionization detector. The detector was calibrated to benzene at the start of the field day and checked with benzene at the close of the day for instrument drift.

Soil samples collected for laboratory analysis were collected where the highest VOC concentration occurred in a boring, and again at the end of a boring. The samples were placed in four-ounce glass jars and packed tight to eliminate as much head space as possible. Sample jars were sealed with Teflon-lined lids, placed in a cooler and sent to a state certified laboratory. Soil samples submitted to the laboratory were analyzed for TPH.

Monitoring wells were constructed in three boreholes (Figure 2). Monitoring well construction was as follows. A ten feet long PVC well screen with 0.010 inch slots

was connected to a half-foot end cap and a schedule 40 PVC well case. PVC sections were connected using internal threads and a rubber O-ring seal between coupled sections.

After the well case was centered in a bore hole, a filter pack of number 45-50 sand was constructed to two feet above the well screen section. The filter sand was followed by two feet of fine sand. The fine sand was followed by two feet of bentonite pellets, followed by granular bentonite to two feet below ground surface (bgs). However, in MW-2 the fine sand was not used because the top of the screen was too close to ground surface. Monitoring wells were initially finished with flush with grade covers because of site traffic. However, GAS was informed that the area around MW-1 would be filled to sidewalk grade. Accordingly the PVC well case was extended to two feet above the proposed grade and the well finished with an above grade protective cover (Appendix C).

Monitoring well MW-1 extends to a depth of 27.87 feet below ground surface (bgs) and is located 30 feet southwest of the original tank excavation. Monitoring well MW-2 extends to a depth of 16.44 feet bgs and is located 50 feet northwest of the tank excavation. Monitoring well MW-3 extends to a depth of 18.66 feet bgs and is located 80 feet northeast of the tank excavation.

Monitoring wells were developed to remove fine-grained sediment from well screens and filter packs, and to develop the hydrological connection between wells and the formation. A bailer was used to purge wells dry. Wells were allowed to recover, then purged dry again. Approximately 18.5 gallons of water was bailed from MW-1. The well produced clear, sediment-free water. Approximately 39.5 gallons of water was bailed from MW-2. The water was turbid and had a petroleum odor. Droplets of petroleum were floating on the water. Approximately 28.5 gallons of water was bailed from MW-3. The water was initially turbid and remained turbid.

Before groundwater samples were collected, wells were purged in order to remove stagnant water from well casings and filter packs. Approximately 13.5 gallons was removed from MW-1, 12.5 gallons was removed from MW-2, and 9.5 gallons was removed from MW-3. Temperature, pH, and conductivity of the water samples were measured when samples were collected.

Soil Borings

The sediments encountered in the soil borings had a complex distribution; coarse-grained sediments grade into and are interbedded with fine-grained sediments (Figure 3). Soil boring SB-1 is located at the end of a topographically depressed trench-like area that contains a railroad siding, which parallels a loading dock area. Neither A or B soil horizons were present in SB-1. The sediments in SB-1 included clays and sandy clays (Appendix B).

Soil Boring SB-2 is located adjacent to a plant building. The upper ten feet of SB-2 was sand and gravel; no soil horizons were observed. It is probable that the sands and gravel are fill implaced during construction.

Soil Boring SB-3 is located on a topographic high that is also a surface water divide. In SB-3, below a layer of asphalt and crushed stone, sediments from 1 to 3 feet bgs appeared to be native soil horizons. The sediments at the location of SB-3 are probably an unaltered natural distribution. Below the soil horizons, 9 feet of clays occur. Below the clays, 11 feet of clayey sand, sand, and gravel occur.

The sands and gravels in SB-3 probably grade into the sandy clays in SB-1. A sand stringer in SB-1 may also be connected to the sand and gravel in SB-3 (Figure 3). The upper clay unit in the three soil borings appears to be the same unit, forming a seal between the surface and coarser-grained more permeable sediments at depth.

Field Screening

Samples from soil borings were field screened for VOCs using an HNu Model PI-101 photoionization detector. VOC levels ranged from <0.1 ppm to 400 ppm (Table 1). In soil boring SB-1 VOC levels were comparatively higher in the upper 19 feet than in the lower 20 feet: an average of 16 ppm compared to an average of 1.5 ppm in the lower zone. VOC levels were highest in the upper 7 feet; the levels ranged from 25 to 30 ppm. In soil boring SB-2, VOC levels were high, an average of 106 ppm. The maximum level, 400 ppm, occurred at 7 to 9 feet bgs in a layer of black-stained sediment. The soil had a noticeable gasoline odor. In soil boring SB-3, VOC levels were low. No sample had a VOC level higher than 0.5 ppm. The average was 0.2 ppm.

Groundwater

The water table elevations were measured on four occasions (Table 2). The first two measurements were collected during well development on April 24 and 30, 1990 (Figure 4). On those occasions the apparent flow direction was east of south (S16°E and S8°E). The third measurement was collected before sampling, on May 21, 1990. The apparent flow direction was to the south (S10°E).

The first three sets of measurements were collected before well covers were vented. When well covers were opened an audible release of air occurred, and well covers were lifted by pressure from released gases. After the well covers were vented and wells allowed to stabilize for two weeks, water table elevations were measured. The apparent flow direction on June 6, 1990, was to the south (S17°E). Throughout the investigation, the wells had a consistent flow direction to the south averaging S13°E.

Although the apparent flow direction appears to preclude the possibility of groundwater flow from the area where the storage tank was located, toward MW-2 (Figure 4), the water table at the tank excavation area is probably a local high. The resulting flow would be radial as in Figure 5, and thus to both MW-2 and MW-3. Additionally, a radial flow pattern would in part help to explain the observed difference in soil and groundwater BTEX levels. Additionally, a sewer lateral was located adjacent to the storage tank (Initial Environmental Assessment). The lateral extends to the west through the loading dock and to the south across National Avenue. Sediments along the sewer were probably a conduit for movement of water and petroleum from the tank area towards the loading dock area.

During the investigation from April 24 to June 6, water table elevations in MW-1, MW-2, and MW-3, in general, had an increasing trend (Figure 6). However, the water table elevations in MW-3 decreased between the third and fourth measurements.

LABORATORY RESULTS

Soil Samples

Soil samples were collected from the intervals where field screening indicated possible contamination and at the end of a boring. Soil samples were submitted to a state

certified laboratory (Appendix F). Only one soil sample had TPH levels above the laboratory detection limit of 5 ppm (Table 1). In soil boring SB-2, soils from 7 to 9 feet bgs were stained black, smelled of petroleum, and field screened at 400 ppm VOCs. The soil sample had a TPH level of 550 ppm, characterized as gasoline. The soil sample from the end of SB-2 had no detection of TPH. No TPH was detected in either SB-1 or SB-3.

Water Samples

Groundwater samples were collected on May 21, 1990, and submitted to a state certified laboratory (Appendix G). VOC scans were run on the samples to analyze for BTEX to verify field VOC screening results, and to test for possible site safety hazards. Monitoring well MW-1 did not contain measurable levels of BTEX, however, three species of chlorinated hydrocarbons were detected (Table 3). In monitoring well MW-2, both ethylbenzene and xylenes were detected at levels above the Wisconsin Department of Natural Resources (WDNR) preventative action limit (PAL), and in the case of xylenes, the level was above the WDNR enforcement standard (ES) and the PAL. Additionally, a chlorinated hydrocarbon, 1,1-dichloroethylene was detected in MW-2 at a concentration above both the PAL and the ES. In monitoring well MW-3, ethylbenzene and xylenes were detected. However, levels were below the PAL and ES for those compounds. Additionally, 1,1-dichloroethylene was detected at a concentration level above both the PAS and the ES.

CONCLUSIONS AND RECOMMENDATIONS

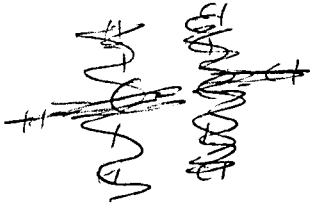
During the initial field investigation, field screening for VOCs and laboratory analysis for TPH detected significant levels of petroleum contamination, and a probable migration path, the sewer lateral, was encountered in the tank excavation. Sediments encountered in the initial tank excavation were predominantly clays. As expected, the sediments encountered in soil boring SB-1 were clays. The sediments in SB-2, however, were sands for the first eleven feet, as were the sediments in SB-3 from 12 to 23 feet bgs. Whether the sands in SB-2 are connected to SB-3 was not determined. The sewer lateral that extended through the tank excavation probably intersects the sand unit present in SB-2.

TABLE 3

Groundwater Chemical Concentrations
May 21, 1990

Groundwater Chemical Concentrations

5-21-90 Compound	MW-1 (PPB)	MW-2 (PPB)	MW-3 (PPB)	Enforcement Standard(ES) (PPB)	Preventative Action Limit(PAL) (PPB)
Benzene	ND	ND	ND	0.67	0.067
Toluene	ND	ND	ND	343	68.6
Ethylbenzene	ND	1000 >PAL	94	1360	272
Total Xylenes	ND	4400 >ES	38	620	124
Dichlorobromomethane	91	ND	ND	NA	NA
Methyl Chloride	190	ND	ND	150	15
Trichloroethene	1300	ND	ND	1.8	0.18
1,1-Dichloroethene	ND	27 >ES	160 >ES	0.24	0.024



Groundwater flow direction as indicated by field measurements would preclude migration of floating petroleum and contaminated groundwater from the tank location to MW-2, but the tank was topographically higher, and as such the water table at the tank excavation is probably higher; groundwater flow is probably to the northwest as well as to the south.

Groundwater samples from the monitoring wells MW-2 and MW-3 had petroleum contamination. However, only MW-2 had concentration levels above the WDNR PAL or ES. No petroleum contamination was detected in monitoring well MW-1, which was located ten feet west of the tank excavation. However, an in-ground cement vault was located between the tank excavation and MW-1. The vault probably was a barrier to flow of the upper few feet of groundwater flow and accordingly petroleum.

VOCs were detected in all three wells. Of the four halogenated hydrocarbons detected, three are listed in the Wisconsin Groundwater Quality Standards. All three compounds are above the respective PALs and ESs.

It is recommended that additional soil borings and monitoring wells be constructed to the south of the tank excavation to determine if soils and groundwater in that area were affected by petroleum contamination. Groundwater flow on the south side of the tank excavation is to the south, off the Pressed Steel Tank property limits. The area of recommended additional investigation is to the south of National Avenue.

a. Inside diameter: 7.0 in.
b. Length: 0.5 ft.
c. Material: Steel ☐ 04; Cast Iron; Other ☐ ____
d. Additional protection? ☒ Yes ☐ No
If yes, describe: 1.5 FT. 6 IN ID PVC

3. Surface seal: Bentonite ☒ 30; Concrete ☐ 01; Other ☐ ____

4. Material between well casing and protective pipe: Bentonite ☒ 30; Annular space seal ☐; No. 3 Red Flint Sand; Other ☒ ____

5. Annular space seal: Granular Bentonite ☒ 33
____ Lbs/gal mud weight ... Bentonite-sand slurry ☐ 35
____ Lbs/gal mud weight ..... Bentonite slurry ☐ 31
____ % Bentonite .... Bentonite-cement grout ☐ 50
1.49 Ft^3 volume added for any of the above
How installed: Tremie ☐ 01; Tremie pumped ☐ 02; Gravity ☒ 08

6. Bentonite seal: Bentonite granules ☒ 33
☐ 1/4 in. ☐ 3/8 in. ☐ 1/2 in. Bentonite pellets ☐ 32
Other ☐ ____

7. Fine sand material: Manufacturer, product name and mesh size
Badger Mining Corp. 50-70
Volume added 0.33 ft^3

8. Filter pack material: Manufacturer, product name and mesh size
Unimin Granusil 45-50
Volume added 2.07 ft^3

9. Well casing: Flush threaded PVC schedule 40 ☒ 23; Flush threaded PVC schedule 80 ☐ 24; Other ☐ ____

10. Screen material: PVC
Screen type: Factory cut ☒ 11; Continuous slot ☐ 01; Other ☐ ____
Manufacturer Monoflex
Slot size: 0.010 in.
Slotted length: 10.0 ft.

11. Backfill material (below filter pack): None ☐
Bentonite Chips; Other ☒

Mr. Jim Julien
Pressed Steel Tank
P O Box 10-J
Milwaukee, WI 53214

Dear Mr Julien:

RE: Pressed Steel Tank Property, 1445 S 66th St, West Allis, WI

Contamination resulting from a former Leaking Underground Storage Tank (LUST) system at the above referenced location was reported to this office September 20, 1990. Releases from underground storage tanks regulated under Subtitle I of the Resource Conservation and Recovery Act must comply with the provisions of 40 CFR Parts 280 and 281. The U.S. Environmental Protection Agency (EPA) has the authority to take enforcement action at any time, but generally will not taken action against parties cooperating with the state.

The Wisconsin Department of Natural Resources (WDNR) proceeds in LUST cases under the authority of s. 144.76, Wisconsin Statutes, commonly referred to as Wisconsin's Hazardous Substance Spill Law. The definition of "hazardous substance" as found in s. 144.01(4m), Wisconsin Statutes, includes petroleum products.

In response to a mandate from the EPA to make headway in remediating and closing out LUST cases, the WDNR has implemented the LUST Case Ranking and Scoring System. Based on the information you have submitted to date, your case has been assigned to the Medium Priority Rank group. The following items are considered in ranking a case:

1. Imminent threat to health or fire/explosion hazard.

2. Geologic conditions.

3. Depth to groundwater.

4. Type of contaminant.

5. Degree of contamination.

6. Aquifer use.

Additionally, cases ranked in the "high" category are scored using a Numerical LUST worksheet. LUST Project Managers are assigned a caseload of the top 20 priority cases in their region as determined by rank and numerical score. Cases which do not rank/score in the top 20 (i.e. most medium and low ranked cases), will be dealt with by District staff as time permits. Investigation and cleanup should not, however, be delayed pending WDNR review of your case.

Documentation of the investigation and cleanup should be prepared according to the guidance enclosed and sent to this office upon completion of the project. Remedial actions must adequately cleanup contaminated soil/or groundwater to current WDNR guidelines and/or standards. All products, soil, wastewater, and sludge must be disposed of in compliance with all applicable federal, state, and local laws and regulations. If you have applied for reimbursement through the Petroleum Environmental Cleanup Fund (PECFA), your Form 4 should be sent to the attention of the LUST Project Manager identified in this letter.

The WDNR hopes that the new Ranking and Scoring system will result in the expeditious remediation of LUST cases which pose the greatest risk to the environment and to human health and safety. Your cooperation in this matter is appreciated. Please be aware that failure to adequately address contamination on your site may result in enforcement action and disqualification for PECFA reimbursement.

If you have any questions, please contact me at the above address or at (414)263-8666.

Sincerely,

Charles Krohn
Hydrogeologist, Environmental Repair Section

West Allis, Wisconsin 53214

Dear Mr. Julien:

Enclosed is a copy of the Phase II report, Continued Contaminat Investigation at Pressed Steel Tank Inc., 1452 South 66th Street, West Allis, Wisconsin. Please review and make any corrections you feel are necessary.

Upon your approval, the report will be submitted to the Wisconsin Department of Natural Resources.

Should you have any questions or comments please us at (414) 259-1500.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

FACILITY DESCRIPTION ABSTRACT

Project Contact:	Mr. James Julien, Manager of Facilities, Maintenance, and Environment 1445 South 66th Street West Allis, Wisconsin 53214
Site Address:	1452 South 66th Street West Allis, Wisconsin 53214
Site Description:	NW1/4, NE1/4, Section 3, T6N, R21E, Milwaukee County
Type of Operation:	Company Garage
Tank Excavation:	One 1,000 gallon gasoline tank

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was contracted by Pressed Steel Tank Inc. to perform an investigation of possible soil and groundwater contamination resulting from the operation of an underground petroleum storage tank at 1452 South 66th Street, West Allis, Wisconsin (Figure 1).

BACKGROUND

On October 27, 1989, a 1,000-gallon underground regular gasoline storage tank was removed at Pressed Steel Tank Company Inc. The tank excavation was located at the northwest corner of Building B on the east side of 66th Street (Figure 2).

During excavation, soil samples were screened with an HNu Model PI-101 photoionization detector. Soils at three- or four-foot depths were found to contain 3.8 to 19.6 parts per million (ppm) of volatile organic compounds (VOCs). At a depth of seven feet, backfill material was screened with the HNu and found to contain 52 ppm VOCs. After removal of the backfill, the perimeter material was screened with the HNu and found to contain 2.4 to 72 ppm VOCs.

The pit was excavated to the limits of the property, to physical barriers, and to the maximum depth the contractor could reach (Figure 2). The final excavation dimensions were 12 feet by 9 feet by 9 feet deep. Following excavation, soil samples were screened with the HNu and sent to the laboratory for analysis of total petroleum hydrocarbons (TPH). Photoionization detector field screening for VOCs encountered levels that were generally higher in the north and east walls and base than in the west and south walls of the excavation. However, in the bottom of the east wall, the VOC concentrations were higher after overexcavation. For example, VOCs increased from 3.4 to 4.6 ppm (6.0 to 8.0 feet) in the southeast corner, from 4.0 to 48 ppm (6.0 to 7.0 feet) in the southwest corner, and from 4.0 to 58 ppm (6.0 to 8.0 feet) in the northwest corner. Concentration of VOCs remained at 52 ppm in the base of the excavation. Soil samples collected from corners and the base were analyzed for TPH. However, no TPH was detected at a 5.0 ppm detection limit (Appendix A).

FIGURE 2

SCOPE OF WORK AND OBJECTIVES

During this phase of investigation, the extent of study included three soil borings and three monitoring wells (Figure 2). Soil borings were drilled to determine the degree and extent of soil contamination. Monitoring wells were constructed to sample groundwater in order to determine whether on-site groundwater was contaminated.

METHODS OF INVESTIGATIONS AND FIELD OBSERVATIONS

Every attempt was made to locate soil borings where subsurface conditions could best be documented. However, subsurface conduits, structures, and property boundaries restricted the location of boreholes.

Soil boring and monitoring well construction began on April 17, 1990, and continued through April 19, 1990 (Appendices B and C). Three soil borings (Figure 2) were drilled with a Central Mining Equipment Model 45 truck-mounted drill rig, using 2.75 inch inner diameter hollow stem augers. Soil samples were collected continuously using split spoon samplers. For each sampling interval, a split spoon was driven through the lead auger, the spoon removed, the auger closed, and the hole bored to the base of the sampled interval. After a sample was removed, the spoon was washed with TSP, double rinsed with potable water, and assembled for the next sample interval.

Each sample was split approximately in half and placed in Ziploc plastic bags. The first half was double bagged and placed in a cooler in order to preserve the sample for possible laboratory analysis. The second half, enclosed in a Ziploc plastic bag, was allowed to reach room temperature and was then field screened for volatile organic compounds (VOCs). Samples were field screened with an HNu brand Model PI-101 photoionization detector. The detector was calibrated to benzene at the start of the field day and checked with benzene at the close of the day for instrument drift.

Soil samples collected for laboratory analysis were collected where the highest VOC concentration occurred in a boring, and again at the end of a boring. The samples were placed in four-ounce glass jars and packed tight to eliminate as much head

space as possible. Sample jars were sealed with Teflon-lined lids, placed in a cooler and sent to a state certified laboratory. Soil samples submitted to the laboratory were analyzed for TPH.

Monitoring wells were constructed in three boreholes (Figure 2). Monitoring well construction was as follows. A ten feet long PVC well screen with 0.010 inch slots was connected to a half-foot end cap and a schedule 40 PVC well case. PVC sections were connected using internal threads and a rubber O-ring seal between coupled sections.

After the well case was centered in a bore hole, a filter pack of number 45-50 sand was constructed to two feet above the well screen section. The filter sand was followed by two feet of number 50-70 fine sand. The fine sand was followed by two feet of bentonite pellets, followed by granular bentonite to two feet below ground surface (bgs).

Monitoring well MW-1 extends to a depth of 22.81 feet bgs and is located immediately north of the original tank excavation. Monitoring well MW-2 extends to a depth of 20.66 feet bgs and is located 70 feet northeast of the tank excavation. Monitoring well MW-3 extends to a depth of 20.94 feet bgs and is located 80 feet southeast of the tank excavation.

Monitoring wells were developed to remove fine-grained sediment from well screens and filter packs, and to develop the hydrological connection between wells and the formation. A bailer was used to purge wells dry. Wells were allowed to recover, then purged dry again. Bailing was continued until a total of 13 gallons was removed from MW-1, 11 gallons from MW-2, and 8.5 gallons from MW-3. All three wells produced clear sediment free water (Appendix D). Water purged from monitoring wells was stored on site in sealed drums.

Prior to water sampling, wells were purged of approximately two casing volumes of groundwater in order to remove the stagnant water from the well cases and filter packs. The wells were finished in clayey sediments and as such recharge occurred slowly. Water temperature, conductivity, and pH were measured before sampling (Appendix E).

Soil Borings

Sediments encountered in the soil borings had a uniform distribution (Figure 3). The soils were clays with varying amounts of sand, pebbles, and gravel (Appendix B). Below a layer of asphalt and crushed stone, sediments had a crumbly texture. Discrete soil peds were visible. The soils were mottled light gray and brown and were stained with iron oxide. The horizonization of the soil was interpreted as evidence that the sediments were not physically displaced and therefore probably not fill. A transition in color occurs at depth (9 to 17 feet); clays change color from brown to gray. Additionally, no sand seams or layers of coarse-grained sediments were detected in either soil borings SB-4 or SB-5. However, a three-inch thick sand seam occurred in SB-6 at 7 feet bgs.

Field Screening

Samples from soil borings were field screened for VOCs using an HNu Model PI-101 photoionization detector. VOC levels ranged from 0.2 ppm to 50 ppm (Table 1). In soil borings SB-5 and SB-6 VOC levels were below 5.0 ppm. Soil boring SB-4 had VOC levels greater than 5.0 ppm from 7 to 13 feet bgs. The highest level, 50 ppm, occurred at 7 to 9 feet bgs.

Groundwater

The water table elevations were measured on four occasions (Table 2). The first two measurements were collected during well development on April 24 and 30, 1990 (Figure 4). On those occasions the apparent flow direction was to the southeast (S33°E and S42°E). The third measurements were collected before sampling. However, the wells were not vented, and as such the wells had not equalized. When the wells were opened, an audible release of air occurred and well covers were lifted by pressure from the released gases. On May 21, 1990, the apparent flow direction was to the southwest. However, the water table elevation in MW-4 was 4.5 feet below the average elevation calculated from three other measured elevations (a change in water table elevation of similar magnitude was observed in MW-6). After the well covers were vented and the wells allowed to stabilize for two weeks, water table

elevations were measured on June 6, 1990. The apparent flow direction was to the east (N88°E).

During the investigation from April 24 to June 6, 1990, water table elevations fluctuated (Figure 5), yet there was not a consistent trend among the wells. In general, monitoring wells MW-4 and MW-6 had an increase in water table elevation, whereas MW-5 had a decrease in water table elevation.

LABORATORY RESULTS

Soil Samples

Soil samples were collected from the intervals where field screening indicated possible contamination and from the end of soil borings SB-4 and SB-5. Only one sample had TPH levels above the laboratory detection limit of 5 ppm. In soil boring SB-4, the soil sample from 7 to 9 feet bgs had a TPH of 16 ppm (the interval field screened at 50 ppm VOCs). Soil boring SB-4 was located immediately north of the tank excavation, in the area where a water main prevented overexcavation of additional sediment. The base of the tank was at approximately 8 feet bgs; the highest VOC levels occurred at approximately that depth. Soils at that location were expected to have some contamination. The end of soil boring SB-4 had no detectable TPH. No TPH was detected in samples from either SB-5 or SB-6 (Appendix F).

Groundwater

Groundwater samples were sent to a state certified laboratory and analyzed for BTEX. None of the water samples had BTEX levels above the laboratory detection limits for those compounds (Appendix G).

CONCLUSIONS

During the initial site assessment, a water main prevented overexcavation on the north wall of the excavation. Soil samples collected during the initial assessment had VOC levels that increased with overexcavation and remained approximately constant in the base of the excavation. The soil boring that was expected to have the highest levels of contamination was SB-4. Field screening and laboratory analysis confirmed that

expectation. Detectable levels of petroleum compounds were found in SB-4. The TPH concentration level, 16 ppm, was above the WDNR clean-up standard of 10 ppm. However, field screening was indicative of contamination in only a limited area (7 to 9 feet bgs and 11 to 13 feet bgs). Because a water main extends through the area of questionable soils, excavation of these soils would be difficult. Additionally, the soils are adjacent to the tank excavation, where a soil vent is in place. Soil venting of fine-grained soils is, in general, of limited affect, yet the volume of soil involved may be small enough to be affectively remediated.

No BTEX was detected in groundwater samples from monitoring wells. Although there is some uncertainty as to the direction of groundwater flow, the water samples are probably indicative of the groundwater conditions in the area of the former storage tank. Therefore, no further environmental investigation is recommended, however additional monitoring of the wells may be warranted.

Dear Mr. Julian:

RE: G.A.S. & Associates Proposal for Continued Phase I Assessment, 1452 South 66th Street, Milwaukee, Wisconsin

This letter acknowledges the receipt of the Scope of Work Plan/Assessment Proposal dated March 6, 1990, for the above referenced site, submitted on your behalf by G.A.S. & Associates. The Wisconsin Department of Natural Resources (WDNR) approves this plan as proposed but reserves the right to require additional work if results of this site investigation prove insufficient to:

1. Define the extent and character of contamination at the site; or

2. Develop an adequate remedial action plan.

Questions regarding this case should be directed to the undersigned at the above address or at (414) 562-9685.

Sincerely,

Charles J. Krohn
Hydrogeologist, Environmental Response

Dear Mr. Julian:

RE: Proposal for Phase I Continued Investigation, 1445 S. 66th Street, Milwaukee, Wisconsin

This letter is in response to a Phase I report submitted by G.A.S. Consultants containing results from assessment work performed to date and a proposed workplan for continued assessment.

The Department of Natural Resources approves the work plan outlined on page 16 of the referenced G.A.S. report as proposed.

Should the additional assessment fail to define the horizontal or vertical extent of soil and groundwater contamination or if the assessment proves insufficient to develop an adequate remedial action plan, the WDNR reserves the right to require additional assessment of the site.

Sincerely,

Charles J. Krohn
Hydrogeologist, Environmental Response

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was retained by Interstate Pump and Tank (IPT) to perform a tank abandonment assessment of one underground tank for Pressed Steel Company, Inc., located at 1452 South 66th Street, West Allis, Wisconsin (Figure 1). The first report, entitled Initial Site Assessment for Removal of One Underground Storage Tank was submitted to the Wisconsin Department of Natural Resources on December 7, 1989. Field screening and the results of laboratory testing of soil samples were presented and discussed in the initial site report. No groundwater was in the excavation. Accordingly, no samples were collected. Reproductions of this data are contained in Appendices A and B.

BACKGROUND

On October 27, 1989, a 1,000-gallon underground regular gasoline storage tank was removed at Pressed Steel Tank Company Inc. The tank excavation was located at the northwest corner of Building 2 on the east side of 66th Street (Figure 2).

During excavation, soil samples were screened with an HNu Model PI-101 photoionization detector. Soils at 3 to 4 foot depth were found to contain 3.8 to 19.6 ppm of volatile organic compounds (VOCs). At a depth of 7 feet backfill material was screened with the HNu and found to contain 52 ppm VOCs. After removal of the backfill, the perimeter material was screened with the HNu and found to contain 2.4 to 72 ppm VOCs.

The pit was excavated to the limits of the property, physical barriers, and the maximum depth the contractor could reach (Figure 2). The final dimensions were 12 feet by 9 feet by 9 feet deep. Following excavation, soil samples were screened with the HNu and sent to the laboratory for analysis of total petroleum hydrocarbons (TPH). The result of photoionization detector field screening for VOCs are depected

FIGURE 2

in Table 1. VOC concentrations were generally higher in the north and east walls and base than in the west and south walls of the excavation, except in the bottom of the east wall, the VOC concentrations were higher after overexcavation. For example, VOCs increased from 3.4 to 4.6 ppm (6.0 to 8.0 feet) in the southeast corner, from 4.0 to 48 ppm (6.0 to 7.0 feet) in the southwest corner, and from 4.0 to 58 ppm (6.0 to 8.0 feet) in the northwest corner. Concentration of VOCs remained at 52 ppm in the base of the excavation.

Soil samples collected from corners and the base were analyzed for total petroleum hydrocarbons (TPH). No TPH was detected at a 5.0 ppm detection limit.

Although the results of laboratory analysis for TPH and field screening appear contradictory, an explanation lies in the history of the site. The tank, according to Pressed Steel Personnel, was not used for a "long time". If petroleum hydrocarbons leaked or spilled and sufficient time elapsed for natural flushing of the petroleum hydrocarbons from the soils, no TPH would be detected. The VOCs could be residual concentrations from volatilization of initial petroleum hydrocarbons. Yet if sufficient time has elapsed for natural flushing of the petroleum hydrocarbons, the volatile fraction should also have been removed. A possible explanation, then, is that petroleum hydrocarbons at depth could generate soil gas, the VOCs detected in the excavation; the VOC concentrations increase in the direction of the source, that is with depth, as observed in the excavation. Alternatively, however, VOCs could result from a volume of immobile gases locked in tight soils below the former tank location; the VOCs decrease toward the surface because of increased distance from the source. In order to determine the source of the VOCs and determine if soil and or groundwater contamination exist further investigation is required.

TABLE 1
PHOTOIONIZATION DETECTOR READINGS
H.N.U. PI-101
AND LABORATORY RESULTS
10/27/89

SAMPLE LOCATION	DEPTH (ft)	HNu (PPM)	LAB SAMPLE
West Wall Center	4.0	19.6	
West Wall Center	6.0	22	
West Wall Bottom	8.0	9.6	
East Wall Bottom	8.0	68	
North Wall Center	6.0	72	
South Wall Center	6.0	11.4	
Southwest Corner	6.0	4.0	
Southeast Corner	6.0	3.4	
Northwest Corner	6.0	2.4	
North Wall Center	3.0	3.8	
After overexcavation the results are as follows:			
Bottom Middle Center	8.0	52	
Bottom Middle Center	10.0	52	<5.0
Southwest Corner	7.0	48	<5.0
Northeast Corner	7.0	50	<5.0
East Wall Bottom	8.0	56	
Southeast Corner	8.0	4.6	<5.0
Northwest Corner	8.0	58	<5.0

Approximately 30 cubic yards of soils were removed from the excavation. The soils were staged on a Pressed Steel parking lot. Photoionizaton detector field-screening of the soils measured VOC concentrations of 48 to 58 ppm. Laboratory analysis of a composite soil sample had concentrations of < 5.0 ppm TPH, < 10 ppb (parts per billion) benzene, 2,600 ppb ethylbenzene, 300 ppb toluene, and 7,600 ppb xylene. Additionally, total lead levels were sufficiently low, 3.4 ppm; the level was below the maximum concentration for EP toxicity of lead, 5.0 ppm, which would be a measure of lead that could leach from a soil. An EP toxicity measure would be lower than a total metal concentration for the same soil.

DESCRIPTION OF WORK AND OBJECTIVES

The scope of this work includes three soil borings (Figure 2), in which groundwater sampling wells will be constructed. However, soil borings will be drilled to a maximum depth of 40 feet. If no groundwater is encountered at that depth, a well will not be constructed. The objective is to further determine the extent of subsurface soil and possible groundwater contamination at the site. Following completion of the work, results will be furnished in a report format.

GEOLOGY

Physiography

The physiography of Milwaukee County can be characterized as gently rolling north trending glacial-sculptured hills that roughly parallel Lake Michigan. Three rivers, the Kinnickinnic, Menomonee, and Milwaukee Rivers, dissect the low areas between the moraines and in places cut moraine highlands where the rivers trend eastward. Bluffs formed of glacial deposits border the Lake Michigan shore at various locations along the eastern edge of the county. The bluffs form prominent highlands often

subject to severe erosional problems. The project site, however, is located in the west-central section of the county within the Lake Border Moraine System. The site is near the crest of a hill that forms the divide between the Kinnickinnic and Menomonee River Watershed.

Soils

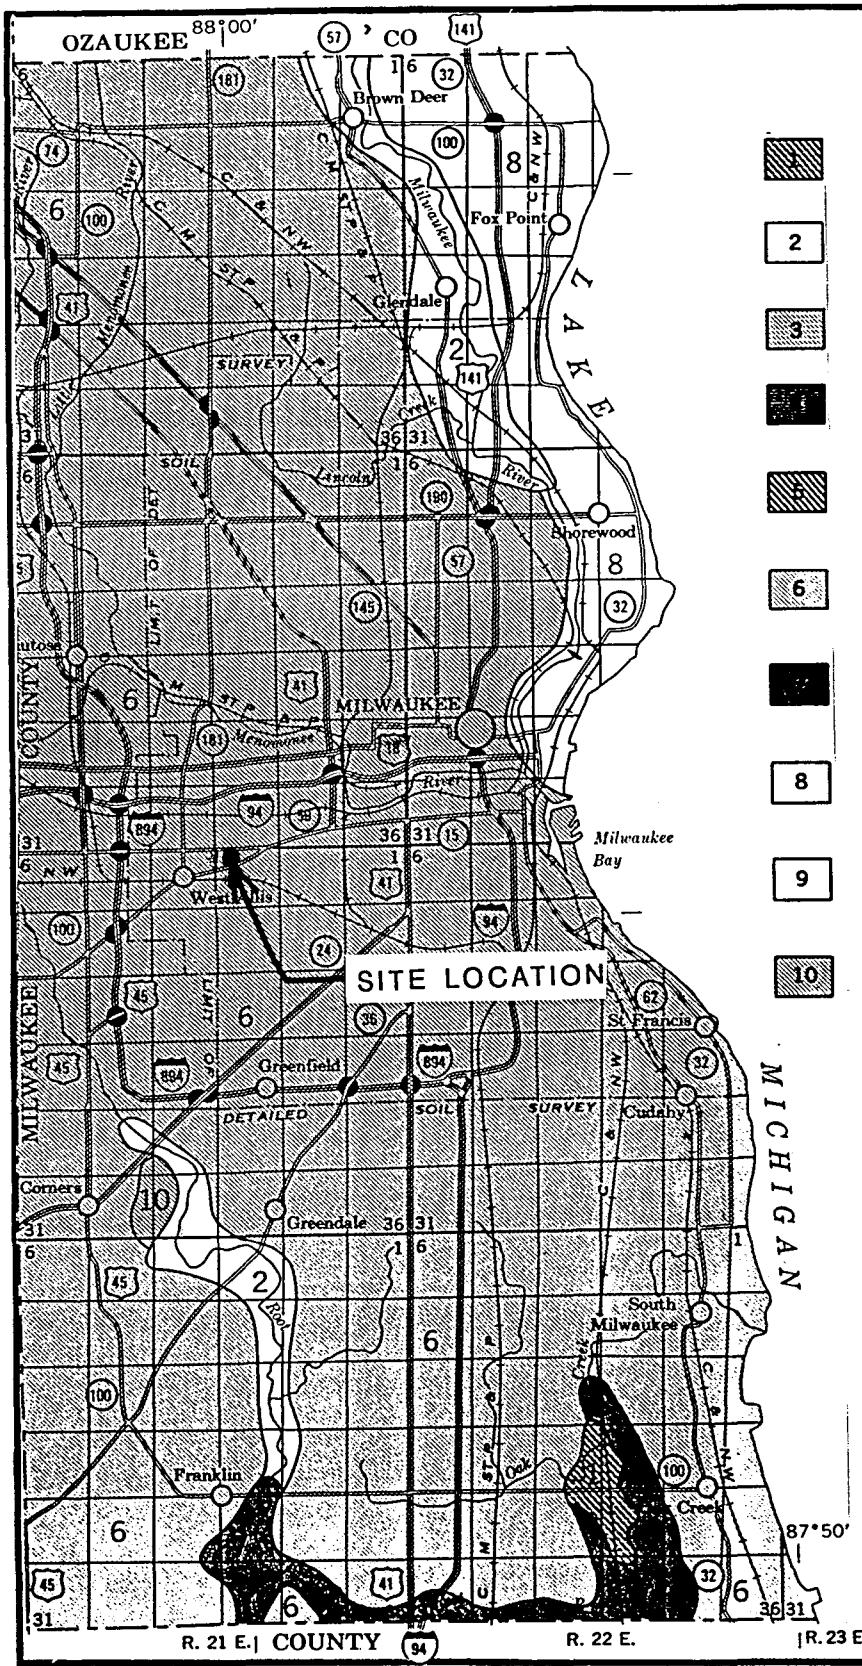
Soils in the Pressed Steel Tank Company area are part of the Ozaukee-Morley-Mequon Association (Figure 3). These soils develop in thin layers of loess over silty clay loam glacial till. The site occurs outside of the area of detailed soils series mapping, yet based on topography and soil association, site soils are probably silty clay loams developed in tills.

Glacial Geology

The landforms and surface deposits of Milwaukee County are a result of glaciations during the Woodfordian and Great Lakean phases of the late Wisconsinan Stage (Pleistocene Series time period) (Figure 4). A series of recessional moraines, formed by the Lake Michigan Lobe, occur in north-trending ridges throughout the county. Deposits are predominantly tills, with minor areas of outwash deposits in the north, east, and south-central parts of the county. Deposits at the site are tills, based upon maps and soils in the excavation. Estimated thickness of the glacial deposits is 200 feet, based on water well contractor reports.

Bedrock

The bedrock units of Milwaukee County are essentially horizontally-bedded Paleozoic sedimentary rock. The northeastern one-seventh of the county is Devonian System dolomites and shales of the Milwaukee Formation (Figure 5). Bedrock in the remainder of the county is Silurian System dolomites. Estimated depth to bedrock at the site is 200 feet below ground surface, based on water well contractor reports.



SOIL ASSOCIATIONS

1 Houghton-Palms-Adrian association: Very poorly drained organic soils in depressions on old lakebeds and on flood plains

2 Fox-Casco association: Well-drained soils that have a subsoil of clay loam; moderately deep to shallow over sand and gravel, on outwash plains and stream terraces

3 Warsaw-Lorenzo association: Well-drained soils that have a subsoil of clay loam; moderately deep over sand and gravel, on outwash plains and river terraces

4 Boyer-Oshtemo association: Well-drained soils that have a subsoil of sandy loam and sandy clay loam underlain by sandy material, on outwash plains

5 Rodman-Casco association: Excessively drained to well-drained soils that have a subsoil of gravelly sandy loam and clay loam; shallow over gravel and sand, on the Kettle Moraine

6 Ozaukee-Morley-Mequon association: Well-drained to somewhat poorly drained soils that have a subsoil of silty clay loam and silty clay; formed in thin loess and silty clay loam glacial till, on moraines

7 Montgomery-Martinton-Hebron-Saylesville association: Poorly drained to well-drained soils that have a subsoil of clay to clay loam; formed in silty clay or silty clay loam sediments, in old lakebeds

8 Kewaunee-Manawa association: Well-drained to somewhat poorly drained soils that have a subsoil of clay and silty clay; formed in thin loess and silty clay glacial till, on moraines and in depressed areas

9 Hochheim-Theresa association: Well-drained soils that have a subsoil of clay loam and silty clay loam; formed in thin loess and loam glacial till, on ground moraines

10 Pella, moderately shallow variant-Knowles association: Poorly drained and well-drained soils that have a subsoil of silty clay loam or clay loam; moderately shallow over dolomite bedrock

FIGURE 5

HYDROLOGY

Milwaukee County contains parts of the Oak Creek, Milwaukee, Menomonee, and Root River Watersheds, all of the Kinnickinnic River Watershed, and areas adjacent to Lake Michigan that drain directly into the lake. The Oak Creek, Kinnickinnic and Milwaukee Rivers drain the eastern part of the county, whereas the Root and the Menomonee Rivers drain the western part of the county.

Pressed Steel Inc. is located within and near the southern boundary of the Menomonee River Watershed. The boundary with the Kinnickinnic River Watershed occurs along National Avenue in the area of the investigation site. Run-off at the site is expected to be intercepted by stormsewers.

A hydrological budget for Milwaukee County from the U.S.G.S. Hydrological Atlas, based on climatological and environmental data from 1931 to 1960, may be summarized as follows. An average of 29 to 31 inches of precipitation falls on the county. Eight inches of intercepted precipitation leave the county as runoff, and 20 to 23 inches leave as evapotranspiration. Two-tenths of an inch are accounted for as pumpage and groundwater flow out of the county. On average there is no net change in storage calculated for the county. However, there are areas in Milwaukee where significant losses in storage are occurring.

HYDROGEOLOGY

Milwaukee County's hydrogeology is dominated by three aquifers: two bedrock aquifers in Paleozoic sedimentary rock, and a sand and gravel aquifer in unconsolidated outwash deposits. Aquifer properties are summarized in Table 2.

TABLE 2

Water resources	Ground water			
	Sand and gravel aquifer		Niagara aquifer	Sandstone aquifer
	Surficial deposits	Buried deposits	Dolomite	Sandstone and dolomite
Quantity	Large yields as much as 1,200 gpm from conventional wells Specific capacities as much as 50 gpm per foot of drawdown Well depths commonly from 30 to 120 feet Limited areal extent Not used extensively	Small to moderate yields, generally not greater than 125 gpm Well depths commonly from 50 to 480 feet Limited areal extent Not used extensively	Small to large yields, as much as 1,200 gpm Specific capacity for wells ranges from 0.2 gpm per foot to 400 gpm per foot of drawdown Well depths commonly from 75 to 300 feet Underlies most of the basin Used extensively over most of the basin	Large yields are as much as 1,500 gpm Specific capacity of high-capacity wells are as much as 14 gpm per foot of drawdown Well depths commonly from 1,000 to 1,800 feet Underlies entire basin Used extensively for high-capacity wells in the lower one-third of the basin
Quality	Good quality Generally very hard (greater than 180 mg/l hardness) water, but locally hard (about 140 mg/l)	Good quality Generally very hard water, but locally hard	Good quality Generally very hard water but locally soft to moderately hard Highly mineralized locally	Quality varies by area Water hard to very hard Saline in some areas
Special considerations	Water table generally shallow Easily polluted by surface wastes	Water table generally shallow; locally artesian Deposits are often thin Generally not subject to pollution except locally	Water table generally from 50 to 100 feet deep; locally artesian Subject to pollution	Artesian Regional decline in water levels due to pumping in lower one-third of basin Not easily polluted
Suitability	Yields locally adequate for municipal, industrial, and other uses Quality adequate	Yields locally adequate for domestic and small municipal and industrial uses Quality adequate	Yields range from adequate for municipal and industrial uses to adequate for only small domestic uses Quality adequate	Yields adequate for municipal, industrial, and other uses Quality adequate except in local areas having saline water

AQUIFER CHARACTERISTICS OF SOUTHEAST WISCONSIN

CONSULTING ENGINEERS
GRAEF ANHALT SCHLOEMER & ASSOCIATES INC.
345 North 95th Street
Milwaukee, Wisconsin 53226

Bedrock Aquifers

The deep bedrock aquifer is predominantly Precambrian and Ordovician sandstones and some dolomites, and is generally referred to as the sandstone aquifer. Throughout the county, the sandstone aquifer is confined by an aquiclude, the Ordovician Maquoketa shale. The aquifer is used for high-yield industrial and private wells.

The shallow bedrock aquifer, the Silurian dolomite aquifer, occurs throughout the county. The aquifer, either by itself or in hydraulic connection with the overlying sand and gravel aquifer, forms the water table aquifer and is used for shallow, industrial, and private wells.

Glacial Aquifer

The glacial aquifer is in sands and gravels deposited by Pleistocene ice sheets in spatially discontinuous outwash deposits throughout Milwaukee County. The aquifer is tapped for low yield private and industrial uses.

In Milwaukee County, the sand and gravel and the dolomite aquifers are recharged with waters from rivers and lakes. Depending on changing climate and seasonal weather patterns, recharge occurs where and when there is a net influx of water to an aquifer. More significantly, however, are areas where sands and gravels or dolomites are at or near the surface, and infiltration of precipitation may occur directly through higher permeability soils.

The sandstone aquifer is recharged from four sources. The first is leakage of groundwater from overlying aquifers through the intervening aquiclude, the Maquoketa Shale. Leakage occurs where the shale is thin, fractured, or interbedded with more permeable units. The second source of recharge is through uncased wells that tap both the dolomite and the sandstone aquifers. Flow of water from the dolomite to

the sandstone occurs because of the greater hydraulic head in the dolomite aquifer. The third source of recharge occurs where the dolomite aquifer and the Maquoketa Shale are missing, and groundwater from sands and gravels or precipitation infiltrates into the sandstone. The fourth source of recharge is infiltration of lake or river water into the sandstone aquifer. The third and fourth sources of recharge occur to the west of Milwaukee County, but are the most significant sources of recharce to the aquifer.

The sand and gravel and the dolomite aquifers discharge to streams, inland lakes and Lake Michigan, where and when the net effect of changing weather and climate conditions and aquifer use is an outflux of water. Other discharge areas occur where water is lost through uncased wells and leakage through the Maquoketa Shale to the sandstone aquifer. Additionally, municipal wells, industrial parks, and quarry operations can cause significant discharge areas. The only significant discharge areas of the sandstone aquifer result from high capacity wells.

A selection of water wells located in the Pressed Steel Inc. area are depicted on Figure 6. Water well contractor reports for these wells are contained in Appendix B.

DESCRIPTION OF FIELD ACTIVITIES

Three soil boring will be drilled and sampled using hollow-stem auger drilling techniques. Samples will be collected continuously with a 2-foot split-spoon soil sampler until field screening detects background levels of VOCs or until groundwater is encountered. Once groundwater is encountered a two feet sample will be collected every five feet. VOC concentrations are detected with a portable HNu photoionization detector equipped with a 10.2 electron volt lamp. Each working day the instrument is calibrated before sample screening begins and checked for drift at the end of each day.

FIGURE 6

Soil samples from each split spoon will be divided in half. One part will be put in a Ziploc-type plastic bag and allowed to attain room temperature, which will be noted and recorded. The HNu meter's probe will be inserted into the bag's headspace and VOC levels will then be recorded. The remaining soils will be placed into a Ziploc-type bag and double bagged. The bags will immediately be placed on ice for possible laboratory analysis. Laboratory analysis of soil samples will be for total petroleum hydrocarbons (TPH) and lead. Soil samples submitted for laboratory analysis will be accompanied by a chain-of-custody form.

Groundwater monitoring wells will be installed in the three soil borings where groundwater is encountered. Monitoring well construction will be of schedule 40 PVC pipe and screens. Ten feet of PVC screen will be used for each well, followed by schedule 40 PVC pipe to ground surface. Each well will be constructed as follows: The annulus surrounding the well screen will be packed with filter sand to two feet above above the screen, covered by one foot of fine sand, followed by a 2-foot thick bentonite pellet seal. A bentonite slurry will follow the pellets to within 2 feet below ground surface. The groundwater monitoring wells will be completed by cementing protective well cover in place. Each well will be surveyed to U.S. Geological Survey datum.

Groundwater monitoring wells will be developed before sampling. A Teflon bailer will be used to alternately purge and surge a well until it produces sediment free water or until ten well volumes have been removed or until the well has been bailed dry. The bailer will be cleaned with a trisodium phosphate detergent (TSP) or Alconox and rinsed with distilled water between wells to prevent cross-contamination.

Prior to sampling, wells will be bailed until the water is clear and pH and electrical conductivity values become stable or until five well volumes have been removed. The

bailer will be cleaned with TSP and rinsed with distilled water between wells. Groundwater samples will be taken using a clear Teflon bailer equipped with a bottom emptying device. The bottom third of the bailer volume will be discarded and all samples will be taken from the middle third of the bailer volume. In-field samples will be immediately tested for conductivity, pH, and temperature. The color, turbidity, and odor of the samples will also be noted. Laboratory samples will be collected in 40-milliliter vials fitted with Teflon-lined lids. A positive meniscus will be attained in the vials, the lids will be slid into place, and the cap secured tightly on top to eliminate any headspace. A total of two field-blank samples will be collected. Field-blank samples will be taken half way through and at the end of each sampling day. The samples will consist of distilled water that has been decanted through the cleaned bailer and bottom emptying device. Field-blanks are used to determine the effectiveness of in-field measures taken to prevent cross-contamination of groundwater samples. All samples (including field-blanks) will be placed on ice in an insulated container and sent to a state-certified laboratory for analysis. The samples will be analyzed for benzene, toluene, xylene, and ethylbenzene (BTEX) and lead.

Drilling equipment will be steam cleaned prior to its use on-site. Augers and downhole tools will be steam cleaned between boring locations. Steam cleaning helps prevent cross-contamination. The split-spoon soil sampler will be washed with TSP and double-rinsed with potable water between collection intervals.

DESCRIPTION OF DATA PRESENTATION

A report will be furnished to the WDNR at the conclusion of the on-site investigation. The report will include soil descriptions, results of the HNu field screening, boring logs, well construction and sampling reports, and analytical sample results. A map

will be generated from these results depicting the extent of any contamination. The three monitoring wells will provide groundwater elevations and flow direction. Recommendations for further investigations and or remediation will be made, based on information gathered during this phase of the study.

RE: Proposals for Phase I Continued
Investigations at Pressed Steel Tank Co., Inc.
West Allis, Wisconsin 53214

Dear Mr. Krohn:

Enclosed are copys of the above referenced proposals. Graef, Anhalt, Schloemer & Associates Inc. (GAS) was contracted by Pressed Steel Tank Company to supervise the removal of one underground storage tank at each of two locations, and conduct an on-site assessment of the soils in the underground tank excavations.

Results based on the on-site screening and laboratory analysis of soils from the tank excavations indicate there is some contamination of the underlying soils.

If you have any questions, or require additional information, please call us at (414) 259-1500.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was retained by Interstate Pump and Tank (IPT) to perform a tank abandonment assessment of one underground storage tank for Pressed Steel Company, Inc., located at 1445 South 66th Street, West Allis, Wisconsin (Figure 1). The first report, entitled Initial Site Assessment for Removal of One Underground Storage Tank was submitted to the Wisconsin Department of Natural Resources (WDNR) on December 7, 1989. Field screening and the results of l[Boratory testing of soil samples were presented and discussed in the initial site report. Water was encountered below the base of excavations, but no sample were collected because it was not possible to determine whether or not the water was representative of local groundwater or water trapped in the immediate vicinity of the tank soils. Reproductions of this data are contained in Appendices A and B.

BACKGROUND

On September 19, 1989, a 1,000-gallon underground regular gasoline storage tank was removed at Pressed Steel Tank Company Inc. The tank excavation was located in a tightly confined area at the far southeast corner of the property near the intersection of 66th Street and National Avenue (Figure 1). The excavation was surrounded on the east and south sides by a security fence, to the west by a retaining wall and a vault for the sprinkler system, and to the north by a concrete drive. The property boundary is two feet outside the fence (Figure 2).

During excavation, a gasoline odor was noticed at a depth of 3.5 feet. The sand backfill was screened with an HNu Model PI-101 photoionization detector and was found to contain 100+ ppm (parts per million) of volatile organic compounds (VOCs). After removal of the backfill, the perimeter soil material was sampled and screened with the HNu. VOC levels were 60 to 208 ppm.

FIGURE 2

While excavating along the west side of the tank, a storm sewer lateral was encountered at a depth of 5.0 feet, approximately 1.5 to 2.0 feet west of the tank. While removing the tank, the storm sewer lateral was punctured in two places. The section of sewer piping running through the excavation and the contaminated sand that surrounded it were removed. Stained soil was observed around the sections of sewer lateral that extended to the north and south beyond the excavation.

On September 20, 1989, the contractor removed the fence around the pit. The pit was excavated to the limits of the property, and the maximum depth the contractor could reach. Final dimensions of the pit were 20.2 feet by 9.0 feet by 8.5 feet deep. The perimeter material was sampled and screened with the HNu; VOC levels were greater than 50 ppm.

Approximately 45 cubic yards of contaminated soils were stockpiled in the staging area. The soils were placed on an impermeable layer of plastic on top of the asphalt parking lot across 66th street. The edges of the plastic were turned up to prevent precipitation run-off from entering the pile. The soil was also covered by an impermeable layer of plastic to prevent infiltration of precipitation and subsequent leaching of contamination.

Laboratory analysis of a composite soil sample had concentrations of 320 ppm TPH, 830 ppb (parts per billion) benzene, 3,500 ppb ethylbenzene, 6,000 ppb toluene, and 31,000 ppb total xylene. These results are further evidence of soil contamination occuring at the site.

On September 21, 1989, holes were augered into the center of each excavation wall (except the retaining wall) to a distance of 5.0 to 5.5 feet, at a depth of 7.0 to 7.5 feet. Samples were taken, screened with the HNu and sent to the laboratory for analysis of total petroleum hydrocarbons (TPH). Also, a test pit was dug in the

base of the excavation. Water, possibly groundwater, was encountered at a depth of 12.5 feet. However, no sample was collected because of the questionable validity of the samples; water ponded in the surrounding a tank would probably have anomalous chemical constituents that are probably uncorrelatable to groundwater constituent levels. A soil sample was taken, field-screened, and sent to the laboratory for analysis of TPH.

The results of photoionization detector field screening for VOCs are depicted in Table 1. Concentrations were greater than 100 ppm in the initial excavation, from 50 to 60 ppm after overexcavation, and 28 to 63 ppm at a distance of five feet into the walls. VOC concentrations in the base of the excavation increased from 120 ppm at 8.25 feet to 242 ppm at 12.16 feet.

Soil samples collected from a distance of five feet into the walls contained from 24 to 440 ppm gasoline (laboratory interpretation of samples) and a sample from the base of the excavation contained 28 ppm gasoline.

From the field screening and laboratory analysis it is obvious that some petroleum hydrocarbon contamination of site soils has occurred. VOC concentrations increase with depth. Movement of released or spilled product was probably directed downward except where the product encountered zones of higher permeability. For example, gasoline concentrations were greatest to the north, 440 ppm, where movement through the soil along the sewer lateral occurred. Downward directed movement of product is evidenced by the increase in VOC concentrations with depth.

The VOCs detected in the site soils could be a result of: a) residual product, as evidenced by the detected gasoline, b) residual volatiles locked in tight soils, or c) soil gas volatilizing from petroleum product located at depth. In order to determine the

nature and extent of contamination, further investigation of the site is necessary.

DESCRIPTION OF WORK AND OBJECTIVES

The scope of this work includes three soil borings (Figure 2), in which groundwater sampling wells will be constructed. However, soil borings will be drilled to a maximum depth of 40 feet. If no groundwater is encountered at that depth, a well will not be constructed. The objective is to further determine the extent of subsurface soil and possible groundwater contamination at the site. Following completion of the work, results will be furnished in a report format.

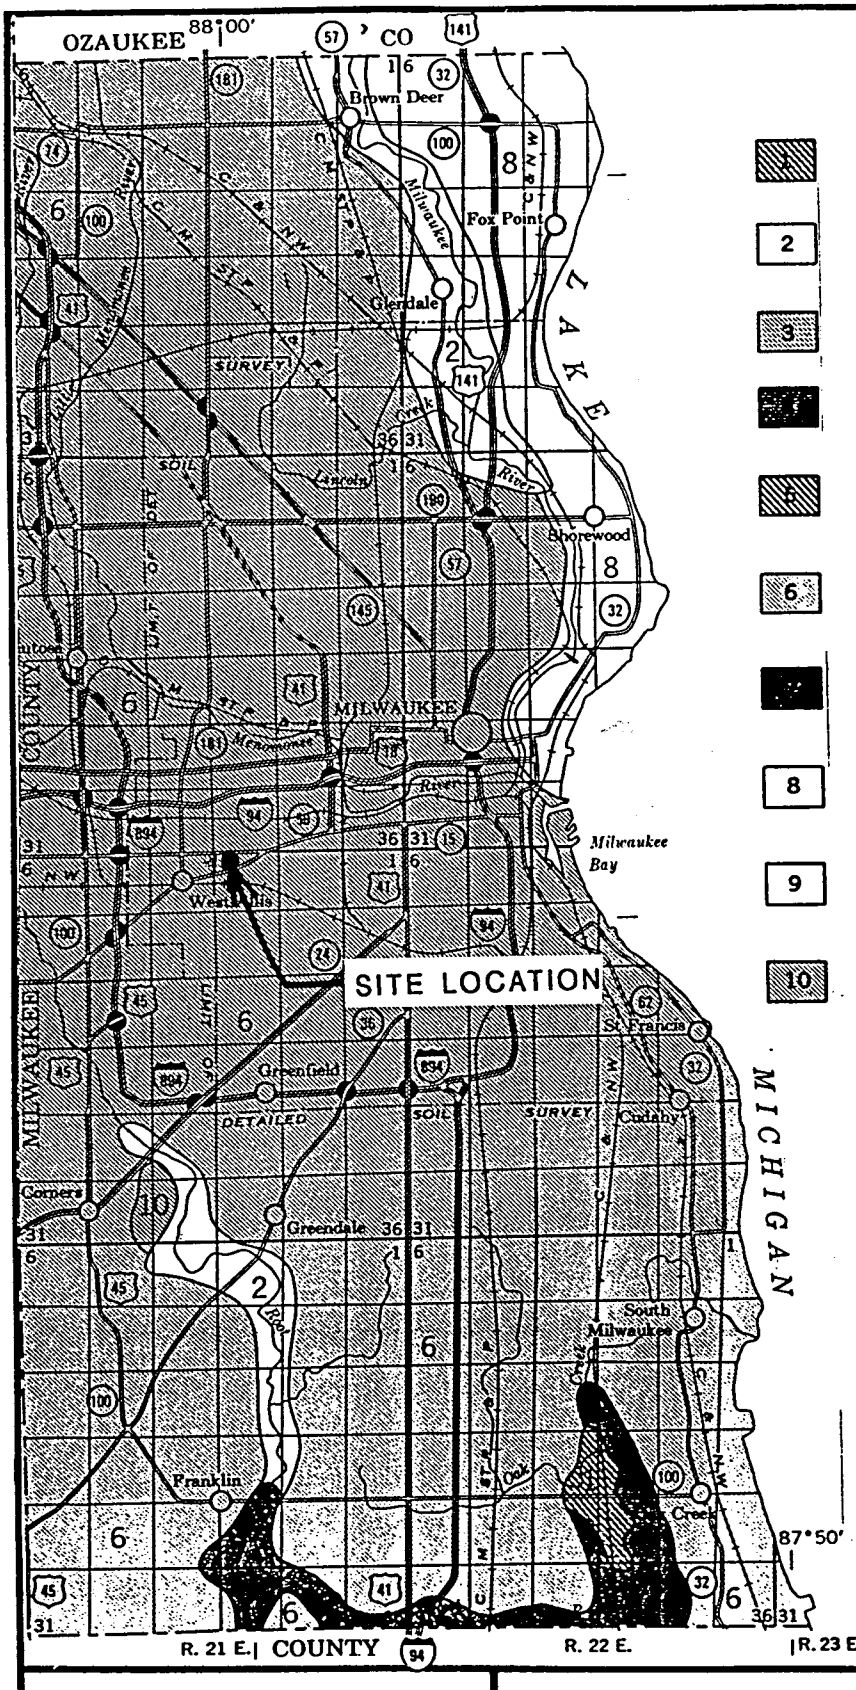
GEOLOGY

Physiography

The physiography of Milwaukee County can be characterized as gently rolling north trending glacial-sculpted hills that roughly parallel Lake Michigan. Three rivers, the Kinnickinnic, Menomonee, and Milwaukee Rivers, dissect the low areas between the moraines and in places cut moraine highlands where the rivers trend eastward. Bluffs formed of glacial deposits border the Lake Michigan shore at various locations along the eastern edge of the county. The bluffs form prominent highlands often subject to severe erosional problems. The project site, however, is located in the west-central section of the county within the Lake Border Moraine System. The site is near the crest of a hill that forms the divide between the Kinnickinnic and Menomonee Rivers.

Soils

Soils in the Pressed Steel Tank Company area are part of the Ozaukee-Morley-Mequon Association (Figure 3). These soils develop in thin layers of loess over silty clay loam glacial till. The site occurs outside of the area of detailed soils series



SOIL ASSOCIATIONS

1 Houghton-Palms-Adrian association: Very poorly drained organic soils in depressions on old lakebeds and on flood plains

2 Fox-Casco association: Well-drained soils that have a subsoil of clay loam; moderately deep to shallow over sand and gravel, on outwash plains and stream terraces

3 Warsaw-Lorenzo association: Well-drained soils that have a subsoil of clay loam; moderately deep over sand and gravel, on outwash plains and river terraces

Boyer-Oshtemo association: Well-drained soils that have a subsoil of sandy loam and sandy clay loam; underlain by sandy material, on outwash plains

5 Rodman-Casco association: Excessively drained to well-drained soils that have a subsoil of gravelly sandy loam and clay loam; shallow over gravel and sand, on the Kettle Moraine

6 Ozaukee-Morley-Mequon association: Well-drained to somewhat poorly drained soils that have a subsoil of silty clay loam and silty clay; formed in thin loess and silty clay loam glacial till, on moraines

Montgomery-Martinton-Hebron-Saylesville association Poorly drained to well-drained soils that have a subsoil of clay to clay loam; formed in silty clay or silty clay loam sediments, in old lakebeds

8 Kewaunee-Manawa association: Well-drained to somewhat poorly drained soils that have a subsoil of clay and silty clay; formed in thin loess and silty clay glacial till, on moraines and in depressed areas

9 Hochheim-Theresa association: Well-drained soils that have a subsoil of clay loam and silty clay loam; formed in thin loess and loam glacial till, on ground moraines

10 Pella, moderately shallow variant-Knowles association: Poorly drained and well-drained soils that have a subsoil of silty clay loam or clay loam; moderately shallow over dolomite bedrock

FIGURE 3

mapping, yet based on topography and soil association, site soils are probably silty clay loams developed in tills.

Glacial Geology

The landforms and surface deposits of Milwaukee County are a result of glaciations during the Woodfordian and Great Lakean phases of the late Wisconsinan Stage (Pleistocene Series time period) (Figure 4). A series of recessional moraines, formed by the Lake Michigan Lobe, occur in north-trending ridges throughout the county. Deposits are predominantly tills, with minor areas of outwash deposits in the north, east, and south-central parts of the county. Deposits at the site are tills, based upon maps and soils in the excavation. Estimated thickness of the glacial deposits is 200 feet, based on water well contractor reports.

Bedrock

The bedrock units of Milwaukee County are essentially horizontally-bedded Paleozoic sedimentary rock. The northeastern one-seventh of the county is Devonian System dolomites and shales of the Milwaukee Formation (Figure 5). Bedrock in the remainder of the county is Silurian System dolomites. Estimated depth to bedrock at the site is 200 feet below ground surface, based on water well contractor reports.

HYDROLOGY

Milwaukee County contains parts of the Oak Creek, Milwaukee, Menomonee, and Root River Watersheds, all of the Kinnickinnic River Watershed, and areas adjacent to Lake Michigan that drain directly into the lake. The Oak Creek, Kinnickinnic and Milwaukee Rivers drain the eastern part of the county, whereas the Root and the Menomonee Rivers drain the western part of the county.

Pressed Steel Inc. is located within and near the southern boundary of the Menomonee River Watershed. The boundary with the Kinnickinnic River

FIGURE 5

Watershed occurs along National Avenue in the area of the investigation site. Run-off at the site is expected to be intercepted by stormsewers.

A hydrological budget for Milwaukee County from the U.S.G.S. Hydrological Atlas, based on climatological and environmental data from 1931 to 1960, may be summarized as follows. An average of 29 to 31 inches of precipitation falls on the county. Eight inches of intercepted precipitation leave the county as runoff, and 20 to 23 inches leave as evapotranspiration. Two-tenths of an inch are accounted for as pumpage and groundwater flow out of the county. On average there is no net change in storage calculated for the county. However, there are areas in Milwaukee where significant losses in storage are occurring.

HYDROGEOLOGY

Milwaukee County's hydrogeology is dominated by three aquifers: two bedrock aquifers in Paleozoic sedimentary rock, and a sand and gravel aquifer in unconsolidated outwash deposits. Aquifer properties are summarized in Table 2.

Bedrock Aquifers

The deep bedrock aquifer is predominantly Precambrian and Ordovician sandstones and some dolomites, and is generally referred to as the sandstone aquifer. Throughout the county, the sandstone aquifer is confined by an aquiclude, the Ordovician Maquoketa shale. The aquifer is used for high-yield industrial and private wells.

The shallow bedrock aquifer, the Silurian dolomite aquifer, occurs throughout the county. The aquifer, either by itself or in hydraulic connection with the overlying sand and gravel aquifer, forms the water table aquifer and is used for shallow, industrial, and private wells.

TABLE 2

Water resources	Ground water			
	Sand and gravel aquifer		Niagara aquifer	Sandstone aquifer
	Surficial deposits	Buried deposits	Dolomite	Sandstone and dolomite
Quantity	Large yields as much as 1,200 gpm from conventional wells Specific capacities as much as 50 gpm per foot of drawdown Well depths commonly from 30 to 120 feet Limited areal extent Not used extensively	Small to moderate yields, generally not greater than 125 gpm Well depths commonly from 50 to 480 feet Limited areal extent Not used extensively	Small to large yields, as much as 1,200 gpm Specific capacity for wells ranges from 0.2 gpm per foot to 400 gpm per foot of drawdown Well depths commonly from 75 to 300 feet Underlies most of the basin Used extensively over most of the basin	Large yields are as much as 1,500 gpm Specific capacity of high-capacity wells are as much as 14 gpm per foot of drawdown Well depths commonly from 1,000 to 1,800 feet Underlies entire basin Used extensively for high-capacity wells in the lower one-third of the basin
Quality	Good quality Generally very hard (greater than 180 mg/l hardness) water, but locally hard (about 140 mg/l)	Good quality Generally very hard water, but locally hard	Good quality Generally very hard water but locally soft to moderately hard Highly mineralized locally	Quality varies by area Water hard to very hard Saline in some areas
Special considerations	Water table generally shallow Easily polluted by surface wastes	Water table generally shallow; locally artesian Deposits are often thin Generally not subject to pollution except locally	Water table generally from 50 to 100 feet deep; locally artesian Subject to pollution	Artesian Regional decline in water levels due to pumping in lower one-third of basin Not easily polluted
Suitability	Yields locally adequate for municipal, industrial, and other uses Quality adequate	Yields locally adequate for domestic and small municipal and industrial uses Quality adequate	Yields range from adequate for municipal and industrial uses to adequate for only small domestic uses Quality adequate	Yields adequate for municipal, industrial; and other uses Quality adequate except in local areas having saline water

Glacial Aquifer

The glacial aquifer is in sands and gravels deposited by Pleistocene ice sheets in spatially discontinuous outwash deposits throughout Milwaukee County. The aquifer is tapped for low yield private and industrial uses.

In Milwaukee County, the sand and gravel and the dolomite aquifers are recharged with waters from rivers and lakes. Depending on changing climate and seasonal weather patterns, recharge occurs where and when there is a net influx of water to an aquifer. More significantly, however, are areas where sands and gravels or dolomites are at or near the surface, and infiltration of precipitation may occur directly through higher permeability soils.

The sandstone aquifer is recharged from four sources. The first is leakage of groundwater from overlying aquifers through the intervening aquiclude, the Maquoketa Shale. Leakage occurs where the shale is thin, fractured, or interbedded with more permeable units. The second source of recharge is through uncased wells that tap both the dolomite and the sandstone aquifers. Flow of water from the dolomite to the sandstone occurs because of the greater hydraulic head in the dolomite aquifer. The third source of recharge occurs where the dolomite aquifer and the Maquoketa Shale are missing, and groundwater from sands and gravels or precipitation infiltrates into the sandstone. The fourth source of recharge is infiltration of lake or river water into the sandstone aquifer. The third and fourth sources of recharge occur to the west of Milwaukee County, but are the most significant sources of recharce to the aquifer.

The sand and gravel and the dolomite aquifers discharge to streams, inland lakes and Lake Michigan, where and when the net effect of changing weather and climate conditions and aquifer use is an outflux of water. Other discharge areas occur where water is lost through uncased wells and leakage through the Maquoketa Shale

to the sandstone aquifer. Additionally, municipal wells, industrial parks, and quarry operations can cause significant discharge areas. The only significant discharge areas of the sandstone aquifer result from high capacity wells.

A selection of water wells located in the Pressed Steel Inc. area are depicted on Figure 6. Water well contractor reports for these wells are contained in Appendix B.

DESCRIPTION OF FIELD ACTIVITIES

Three soil boring will be drilled and sampled using hollow-stem auger drilling techniques. Samples will be collected continuously with a 2-foot split-spoon soil sampler until field screening detects background levels of VOCs or until groundwater is encountered. Once groundwater is encountered a two feet sample will be collected every five feet. VOC concentrations are detected with a portable HNu photoionization detector equipped with a 10.2 electron volt lamp. Each working day the instrument is calibrated before sample screening begins and checked for drift at the end of each day.

Soil samples from each split spoon will be divided in half. One part will be put in a Ziploc-type plastic bag and allowed to attain room temperature, which will be noted and recorded. The HNu meter's probe will be inserted into the bag's headspace and VOC levels will then be recorded. The remaining soils will be placed into a Ziploc-type bag and double bagged. The bags will immediately be placed on ice for possible laboratory analysis. Laboratory analysis of soil samples will be for total petroleum hydrocarbons (TPH) and lead. Soil samples submitted for laboratory analysis will be accompanied by a chain-of-custody form.

Groundwater monitoring wells will be installed in the three soil borings where

Milwaukee, Wisconsin 53226

FIGURE 6

groundwater is encountered. Monitoring well construction will be of schedule 40 PVC pipe and screens. Ten feet of PVC screen will be used for each well, followed by schedule 40 PVC pipe to ground surface. Each well will be constructed as follows: The annulus surrounding the well screen will be packed with filter sand to two feet above above the screen, followed by a 2-foot thick bentonite pellet seal. A bentonite slurry will follow the pellets to within 2 feet below ground surface. The groundwater monitoring wells will be completed by cementing protective well cover in place. Each well will be surveyed to U.S. Geological Survey datum.

Groundwater monitoring wells will be developed before sampling. A Teflon bailer will be used to alternately purge and surge a well until it produces sediment free water or until ten well volumes have been removed or until the well has been bailed dry. The bailer will be cleaned with a trisodium phosphate detergent (TSP) or Alconox and rinsed with distilled water between wells to prevent cross-contamination.

Prior to sampling, wells will be bailed until the water is clear and pH and electrical conductivity values become stable or until five well volumes have been removed. The bailer will be cleaned with TSP and rinsed with distilled water between wells. Groundwater samples will be taken using a clear Teflon bailer equipped with a bottom emptying device. The bottom third of the bailer volume will be discarded and all samples will be taken from the middle third of the bailer volume. In-field samples will be immediately tested for conductivity, pH, and temperature. The color, turbidity, and odor of the samples will also be noted. Laboratory samples will be collected in 40-milliliter vials fitted with Teflon-lined lids. A positive meniscus will be attained in the vials, the lids will be slid into place, and the cap secured tightly on top to eliminate any headspace. A total of two field-blank samples will be collected. Field-blank samples will be taken half way through and at the end of each sampling day.

The samples will consist of distilled water that has been decanted through the cleaned bailer and bottom emptying device. Field-blanks are used to determine the effectiveness of in-field measures taken to prevent cross-contamination of groundwater samples. All samples (including field-blanks) will be placed on ice in an insulated container and sent to a state-certified laboratory for analysis. The samples will be analyzed for benzene, toluene, xylene, and ethylbenzene (BTEX) and lead.

Drilling equipment will be steam cleaned prior to its use on-site. Augers and downhole tools will be steam cleaned between boring locations. Steam cleaning helps prevent cross-contamination. The split-spoon soil sampler will be washed with TSP and double-rinsed with potable water between collection intervals.

DESCRIPTION OF DATA PRESENTATION

A report will be furnished to the WDNR at the conclusion of the on-site investigation. The report will include soil descriptions, results of the HNu field screening, boring logs, well construction and sampling reports, and analytical sample results. A map will be generated from these results depicting the extent of any contamination. The three monitoring wells will provide groundwater elevations and flow direction. Recommendations for further investigations and or remediation will be made, based on information gathered during this phase of the study.

Mr. Jim Julien
Pressed Steel Tank Co. Inc.
P.O. Box 10-J
Milwaukee, WI 53214

Dear Mr. Julien:

RE: Pressed Steel Tank, 1445 S. 66th Street, West Allis, WI

This letter is in response to an Initial Site Assessment Report dated September 1989, submitted to this office by G.A.S. Consultants, detailing assessment work performed on the referenced property.

The report indicates that both soils and groundwater have been impacted by a release of hydrocarbons at the Pressed Steel Tank plant site.

Please have G.A.S. Consultants submit a detailed workplan for further assessment of the site. The assessment should define the vertical and horizontal extent of groundwater and soil contamination, and should conclude with a proposal for remediation.

Enclosed please find WDNR Site Assessment Guidelines for your information.

Sincerely,

Charles J. Krohn
Environmental Response Hydrogeologist

RE: Site Assessment Report For Removal
of One Underground Storage Tank Located at
1445 South 66th Street

Dear Mr. Julian:

Enclosed is one copy of the above referenced Site Assessment Report. Graef, Anhalt, Schloemer & Associates (GAS) was retained by Interstate Pump & Tank (IPT) to supervise the removal of one underground storage tank, and conduct an on-site assessment of the underground tank excavation soils.

Results based on the on-site screening and laboratory analysis of soils from the tank excavations indicate that there is some contamination of the underlying soils at the site. The Wisconsin Department of Natural Resources (WDNR) was notified, and this proposal follows the required process defined by the WDNR.

If you have any questions or require additional information, please call me at (414) 259-1500, extension 66.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

BUREAU OF SOLID -
HAZARDOUS WASTE MANAGEMENT

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was contracted to perform a site assessment on the abandonment by removal of one underground storage tank at Pressed Steel Tank Company Inc., 1452 South 66th Street, West Allis, Wisconsin (Figure 1).

The purpose of this study was to assess the subsurface conditions surrounding an underground gasoline tank and the associated dispenser and piping at the time of excavation. The excavation involved the removal and disposal of one 1,000-gallon tank. The site assessment followed the Department of Industry, Labor, and Human Relations (DILHR) guidelines for underground tank change of service.

SOIL SAMPLING PROCEDURES

DILHR requirements state that soil samples be taken within or below the excavation at the following locations:

A. At both ends of the tank.
B. Every 20 feet, or segment thereof, along piping runs.
C. Underneath each island on the supply side.
D. At points where strong odors or soil discoloration indicate presence of contamination.
E. If groundwater is encountered within the excavation, a groundwater sample must be taken and analyzed for benzene, toluene, ethylbenzene, and xylene (BTEX).
F. Redundant samples need not be taken.

Representative soil samples were obtained from the walls and bottom of the tank excavation (Figure 2). The samples were split, with one-half being sealed in 1-quart ziploc bags. The duplicate half of the samples were placed in 4-ounce glass jars with Teflon-lined lids, packed on ice, and sent to the laboratory for analysis, accompanied by a chain-of-custody record.

PHOTOIONIZATION DETECTOR READINGS

All soil samples were field-screened with an HNu model PI-101 photoionization detector. The HNu is a portable device capable of detecting the presence of volatile organic compounds (VOC's). It is equipped with a 10.2 electron volt lamp and is calibrated to benzene at the start of each working day.

The HNu field screening process allows soil samples, sealed in Ziploc bags, to warm to ambient temperature. VOC's trapped in the soils volatilize and collect in the headspace of the bag. The HNu probe is inserted and VOC content, in parts per million (ppm), is determined. However, the HNu is only a field screening device; the screening results must be confirmed by lab analysis.

FIELD OBSERVATIONS

On October 27, 1989, Interstate Pump and Tank of Menomonee Falls, Wisconsin removed a 1,000 gallon underground regular gasoline tank at Pressed Steel Tank Company Inc. The tank excavation was located at the northwest corner of building number B. on the east side of 66th Street (Figure 2). The tank was a 1,000 gallon regular gasoline tank, of steel construction installed approximately 35 years ago. Prior to removal, the tank was found to be full of water. The tank was pumped free of water product by National Tank service.

While exposing the tank top, soil samples were screened with an HNu meter. The soils at the 3 to 4 foot depth were found to contain 3.8 to 19.6 ppm of VOC's, using the HNu meter. At a depth of 7 feet, a gasoline odor was noticed and the silty clay backfill material was screened with the HNu. The backfill material was found to contain 52 ppm of VOC's, using the HNu meter (Table 1). The decision was made to remove the tank and then assess the degree of contamination.

After uncovering the tank and exposing the north side, the Contractor pulled the tank out of the pit. While removing the tank, numerous holes and pitting were noticed in the tank shell.

A staging area was designated in one of Pressed Steel Tank Company's parking lots on the other side of the No. B building, south of the project site. The contaminated backfill material was removed from the excavation and piled on plastic and covered, at the staging area.

After removing the backfill material, the perimeter of the excavation was sampled and screened with the HNu. VOC levels ranged from 2.4 to 72 ppm, using the HNu (Table 1). The soil samples were very moist.

The excavation was surrounded on the south side by a building. To the west was the property line, sidewalk and South 66th street. The north side of the excavation contained a water main that was located approximately 5 feet away from the tank.

The pit was excavated to the limits of the property and physical barriers. It was excavated to the maximum depth the Contractor could reach. Final dimensions of the pit were 12 feet long by 9 feet wide by 9 feet deep. The contaminated soils removed from the excavation were piled on the staging area. The VOC levels were 48 ppm to 58 ppm, using the HNu meter (Table 1).

A six inch soil venting sump was installed in the excavation. It was placed in the southern middle of the excavation. The sump is constructed of .10 inch slotted PVC piping.

Scrap disposal records can be found in Appendix B. The tank inventory form can be found in Appendix C. Photodocumentation can be found in Appendix D.

The excavated contaminated soils that are staged on site will be properly permitted and landfilled at a state registered landfill site.

This subsurface assessment is limited to the immediate area surrounding the tank excavation. GAS cannot be held responsible for the documentation of on-site contamination that may be present at other areas of the project site.

This form is to be completed pursuant to Section 101.142, Wis. Stats., to register all underground tanks in Wisconsin that have stored or currently store petroleum or regulated substances. Please see the reverse side for additional information on this program. An underground storage tank is defined as any tank with at least 10 percent of its total volume (included piping) located below ground level. A separate form is needed for each tank. Send each completed form to the agency designated in the top right corner.

This registration applies to a tank that is (check one):
1. ☐ In Use
2. ☐ Abandoned With Product
3. ☐ Abandoned No Product (empty) or With Water
4. ☒ Abandoned - Tank Removed
6. ☐ Abandoned - Filled With Inert Material
7. ☐ Out of Service

Milwaukee, WI 53214

Dear Mr. Julien:

RE: 1445 S. 66th Street, West Allis, WI

This letter acknowledges your report of contamination resulting from the former underground storage tank operation at the above referenced location.

> Wisconsin Statute 144.76(3) states: A person who possesses or controls a hazardous substance which is discharged or who causes the discharge of a hazardous substance shall take the actions necessary to restore the environment to the extent practicable and minimize the harmful effects from the discharge to the air, lands, or waters of this state."

The Department identifies Pressed Steel Tank Company, Inc. as the party responsible for taking the actions necessary to restore the environment. You are required to conduct a subsurface investigation to determine the extent and character of the contamination and implement a clean up program. A scope of work plan should be submitted to this office within 30 days.

If you have any questions please contact me at (414) 562-96684 or at the above address.

Sincerely,

Bernice A Aument

BUREAU OF SOLID -
HAZARDOUS WASTE MANAGEMENT

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was contracted to perform a site assessment on the abandonment by removal of one underground storage tank at Pressed Steel Tank Company Inc., 1445 South 66th Street, West Allis, Wisconsin (Figure 1).

The purpose of this study was to assess the subsurface conditions surrounding an underground gasoline tank and the associated dispenser and piping at the time of excavation. The excavation involved the removal and disposal of one 1,000-gallon tank. The site assessment followed the Department of Industry, Labor, and Human Relations (DILHR) guidelines for underground tank change of service.

SOIL SAMPLING PROCEDURES

DILHR requirements state that soil samples be taken within or below the excavation at the following locations:

A. At both ends of the tank.
B. Every 20 feet, or segment thereof, along piping runs.
C. Underneath each island on the supply side.
D. At points where strong odors or soil discoloration indicate presence of contamination.
E. If groundwater is encountered within the excavation, a groundwater sample must be taken and analyzed for benzene, toluene, ethylbenzene, and xylene (BTEX).
F. Redundant samples need not be taken.

Representative soil samples were obtained from the walls and bottom of the tank excavation, under the fill pipe and along the supply lines (Figure 2). The samples were split, with one-half being sealed in 1-quart ziploc bags. The duplicate half of the samples were placed in 4-ounce glass jars with Teflon-lined lids, packed on ice, and sent to the laboratory for analysis, accompanied by a chain-of-custody record.

PHOTOIONIZATION DETECTOR READINGS

All soil samples were field-screened with an HNu model PI-101 photoionization detector. The HNu is a portable device capable of detecting the presence of volatile organic compounds (VOC's). It is equipped with a 10.2 electron volt lamp and is calibrated to benzene at the start of each working day.

The HNu field screening process allows soil samples, sealed in Ziploc bags, to warm to ambient temperature. VOC's trapped in the soils volatilize and collect in the headspace of the bag. The HNu probe is inserted and VOC content, in parts per million (ppm), is determined. However, the HNu is only a field screening device; the screening results must be confirmed by lab analysis.

FIELD OBSERVATIONS

On September 19, 1989, Interstate Pump and Tank of Menomonee Falls, Wisconsin removed a 1,000 gallon underground regular gasoline tank at Pressed Steel Tank Company Inc. The tank excavation was located at the far southeast corner of the property near the intersection of 66th Street and National Avenue. The tank was a 1,000 gallon regular gasoline tank, of steel construction installed approximately 45 - 50 years ago. Prior to removal, the tank was pumped free of any excess product.

While exposing the tank top, no contamination was encountered. However, at a depth of 3.5 feet, a gasoline odor was noticed and the sand backfill material was screened with the HNu. The backfill material was found to contain 100+ ppm of VOC's. The decision was made to remove the tank and then assess the degree of contamination.

While excavating along the west side of the tank, a storm sewer lateral was encountered at a depth of 5.0 feet, approximately 1.5 to 2.0 feet west of the tank. After uncovering the tank and exposing the west side, the Contractor attempted to drag the tank out of the pit. The tank appeared to be in very poor condition, with excessive pitting and corrosion. While raising the tank, product and water escaped through numerous holes in the bottom of the tank shell. The tank was immediately set down on an angle to prevent the remaining product from escaping. The chain was reattached and the tank was removed and set on its side. A commercial absorbent material was used to clean up the product released onto the concrete drive.

A staging area was designated in one of Pressed Steel Tank Company's parking lots on the other side of 66th Street, east of the project site. The contaminated backfill material was removed from the excavation and piled at the staging area.

While removing the tank, the storm sewer lateral was punctured in two places. It was decided to remove the section of sewer piping running through the excavation and remove the contaminated sand that surrounded it.

After removing the backfill material, the perimeter of the excavation was sampled and screened with the HNu. VOC levels were 60+ ppm to 208 ppm (Table 1).

The project site was located at the extreme southeast corner of the property in a tightly confined area. The excavation was surrounded on the east and south sides by a security fence. To the west was a retaining wall and vault for the sprinkler system, and to the north was a concrete drive. Two feet from the outside of the fence is the city sidewalk and boundary of the property (Figure 2).

The following day, September 20, 1989, the Contractor returned and removed the fence. The pit was excavated to the limits of the property and physical barriers. It was excavated to the maximum depth the Contractor could reach. Final dimensions of the pit were 20.2 feet long by 9.0 feet wide by 8.5 feet deep. The contaminated soils removed from the excavation were piled on the staging area. Soil samples were taken from the perimeter of the excavation and screened with the HNu. The VOC levels were all 50 ppm or greater (Table 1).

Approximately 45 cubic yards of contaminated soils were stockpiled in the staging area. The soils were placed on an impermeable layer of plastic on top of the asphalt parking lot. The edges of the plastic were turned up to prevent precipitation run-off from entering the pile. The soil pile was also covered by an impermeable layer of plastic to prevent infiltration of precipitation and subsequent leaching of contamination.

On Thursday, September 21, 1989, GAS returned to the site to conduct horizontal borings into the side walls of the excavation. The borings were conducted using a hand-powered bucket auger. A hole was augered into the center of each excavation wall (with the exception of the concrete retaining wall to the west) at a depth of 7.0 to 7.5 feet. Each hole was augered into the side wall 5.0 to 5.5 feet. A sample was taken, screened with the HNu (Table 2) and sent to the lab for analysis of TPH (Appendix B).

The first hole, Hand Auger 1 (HA-1) was augered in the north wall at a depth of 7.0 feet, 5.5 feet into the side wall of the pit. HNu screening detected 42 ppm and lab analysis indicated 440 ppm TPH (Appendix A).

Hand Auger 2 (HA-2) was bored into the center of the east wall at a depth of 7.0 feet. It reached 5.33 feet into the east side of the excavation. The HNu detected 68 ppm and lab analysis indicated 100 ppm TPH (Appendix A).

Hand Auger 3 (HA-3) was augered in the center of the south wall at a depth of 7.5 feet, extending 5.0 feet into the wall of the pit. The HNu detected 38 ppm and lab analysis indicated 24 ppm TPH (Appendix A).

A test pit was dug along the base of the excavation to determine vertical extent of contamination. The trench was dug to a depth of 12.3 feet with groundwater being encountered at an approximate depth of 12.25 feet. A soil sample was taken just above the groundwater interface at 12.2 feet. The HNu detected 24+ ppm and lab analysis indicated 28 ppm TPH (Appendix A).

CONCLUSION AND RECOMMENDATIONS

The Wisconsin Department of Natural Resources (WDNR) sets a maximum allowance of TPH in soils at 10 ppm. Lab analysis of the soil samples taken with the use of a hand auger beyond the walls of the excavation and a sample taken at the groundwater interface exceeded this limit.

It is recommended that a Phase II investigation be initiated. The purpose of this investigation would be to define the extent of contamination. It would include descriptions of present site conditions, soils, local hydrogeology, and proposed field activities including borings and monitoring well installation. A proposal for this Phase II investigation will be submitted to the WDNR and Pressed Steel Tank Company Inc. for their approval.

UNDERGROUND PETROLEUM PRODUCT TANK INVENTORY

Send Completed Form To:
Safety & Buildings Division
P.O. Box 7969
Madison, WI 53707
Telephone (608) 267-5280

This form is to be completed pursuant to Section 101.142, Wis. Stats., to register all underground tanks in Wisconsin that have stored or currently store petroleum or regulated substances. Please see the reverse side for additional information on this program. An underground storage tank is defined as any tank with at least 10 percent of its total volume (included piping) located below ground level. A separate form is needed for each tank. Send each completed form to the agency designated in the top right corner.

This registration applies to a tank that is (check one):
1 ☐ In Use
2 ☐ Abandoned With Product
3 ☐ Abandoned No Product (empty) or With Water
4. ☒ Abandoned - Tank Removed
6. ☐ Abandoned - Filled With Inert Material
7. ☐ Out of Service

Fire Department Providing Fire Coverage Where Tank Located: West Allis

C. TANK CONSTRUCTION:

1. ☒ Bare Steel
2. ☐ Cathodically Protected and Coated Steel (☐ Sacrificial Anodes or ☐ Impressed Current)
3. ☐ Coated Steel
4. ☐ Fiberglass
5. ☐ Other (specify): _____
6. ☐ Relined
7. ☐ Steel - Fiberglass Reinforced Plastic Composite

Is tank UL Approved? ☐ Yes ☒ No
Is Tank Double Walled? ☐ Yes ☒ No
Overfill Protection Provided? ☐ Yes ☐ No If yes, identify type:

D. PIPING CONSTRUCTION

1. ☒ Bare Steel
2. ☐ Cathodically Protected Steel (With Coating? ☐ Yes ☐ No)
3. ☐ Coated Steel
4. ☐ Fiberglass
5. ☐ Other (specify): _____
6. ☐ Unknown

Cathodic Protection By: ☐ Sacrificial Anodes or ☐ Impressed Current
UL Approved? ☐ Yes ☐ No
Double Walled ☐ Yes ☐ No

E. TANK CONTENTS

1. ☐ Diesel
2. ☒ Leaded
3. ☐ Unleaded
4. ☐ Fuel Oil
5. ☐ Gasohol
6. ☐ Other
7. ☐ Empty
8. ☐ Sand/Gravel/Slurry
9. ☐ Unknown
10. ☐ Premix
11. ☐ Waste Oil
12. ☐ Propane
13. ☐ Chemical * _____ _____ _____
14. ☐ Kerosene
15. ☐ Aviation

* If # 13 is checked, indicate the chemical name(s) or number(s) of the chemical or waste

If Tank Abandoned, Give Date (mo/day/yr): 9-19-89
Has Clean Closure Status Been verified? (see reverse side for details) ☐ Yes ☐ No

If installation of a new tank is being reported, indicate who performed the installation inspection.
1 ☐ Fire Department
2. ☐ DILHR
3 ☐ Other (identify) _____

Date Signed: 11-16-89

BACKGROUND FOR TANK INVENTORY

On May 4, 1984, legislation commonly known as the Groundwater Protection Act was signed into law. This legislation required the creation of an inventory of underground petroleum product storage tanks. A record of this information was necessitated by numerous reported incidents of groundwater contamination by petroleum products. Many tanks have been installed, used and forgotten. These installations can threaten the groundwater.

This underground tank inventory is being established to help identify the need for future actions required to clear up potential problems before they occur. Your help in identifying abandoned, " in use " and " new use " tank locations will greatly assist this effort to protect Wisconsin's groundwater.

CLEAN CLOSURE INFORMATION

Requirements for clean closure of an out-of-service underground storage tank were outlined in the proposed federal rules in the April 17, 1987 Federal Register, Volume 52, No. 74 at § 280.80 as follows:

> (d) This requirement is satisfied if one of the external monitoring release detection methods allowed under § 280.41 is in use at the site at the time of closure, or if the owner or operator uses:
>
> (1) Portable gas chromatograph mapping;
>
> (2) Analysis of soil core samples for hydrocarbon and /or chemical contamination in the unsaturated zone;
>
> (3) Analysis of groundwater surrounding the tank for released product; or
>
> (4) Another site assessment method that has been approved by the implementing agency.

To record a clean closure, a report of the information and results obtained through the site assessment must be submitted to the following address:

Safety & Buildings Division
P.O. Box 7969
Madison, WI 53707

Additional Comments:

1-1000 gal UST, regular gas, not in use for many years, full of H_2O. Did some excavating but contamination continued on down into soil. Backfilled until later. This is the same site where a LUST was found about 1 month ago.

PRIORITY SCREENING WORKSHEET

HIGH FACTORS: (DEFINITION: Any case which presents an actual threat to human health, or has a high potential of causing a threat to human health and property; and/or any case which has caused or has a high potential of causing substantial impacts to the soil, waters and air of the State of Wisconsin).

EMERGENCY FACTORS:

___ Contaminated private or public well >NR 140 enf. std.
___ Explosive or toxic vapors in structures
___ Threat of fire

HIGH FACTORS:

___ Floating product (including sheen)
___ GW contamination (>140 enf. std.)
___ Impacted surface water - - wetland, trout stream, etc. impacted
___ Saturated soil contamination posing a risk to groundwater

MEDIUM FACTORS: (DEFINITION: Any case which does not appear to be an immediate threat to human health or vital natural resources but which shows levels of contamination that may cause substantial environmental impacts if left unaddressed.)

___ Moderate soil contamination with potential for impacting groundwater.
___ Impacted surface water - - no critical habitat threats.
___ Groundwater contamination >NR 140 PAL.

LOW FACTORS: (DEFINITION: Any case where contamination has been documented, but which presents limited potential for immediate threat to human health and vital natural resources.)

___ Soil contamination which appears to have a limited potential for impacting groundwater.
___ Initial Remedial action has substantially reduced environmental threat.

UNKNOWN FACTORS: (DEFINITION: Any case where some indication of contamination is present, but due to incomplete or inaccurate information the level of threat to human health or the environment can not be assessed at this time.)

___ Inadequate information to assign a high, medium, or low ranking.

NUMERICAL LUST SCORING WORKSHEET

1. GROUNDWATER & SOILS:

POINTS:		Points:	
20	Municipal well impacted	10	Major soil and/or gw >ES within 1200' of a public well
18	>6 private wells impacted	8	Major soil and/or gw >ES within 1200' of one or more private wells
16	4 - 6 private wells impacted	6	Groundwater contamination >ES
14	2 - 3 private wells impacted	4	Groundwater contamination <ES
12	1 private well impacted	2	Soil contamination

For purposes of this scoring, private well includes any non-municipal water supply system (e.g. non-community and other than municipal)

2. EXPLOSIVE OR TOXIC VAPORS:

POINTS: CONFIRMED	POTENTIAL	
20	10	Explosive levels in a residence or building
16	8	Explosive levels in a sewer or other confined space
12	6	Toxic levels in a residence or building

NOTE: Explosive levels determined to be >20% LEL as per an explosivity meter, toxicity levels are based on OSHA permissible exposure limits (PEL's)

3. SURFACE WATER IMPACTS:

POINTS: CONFIRMED	POTENTIAL	
14	7	Visible sheen or product on sensitive surface water environment (e.g. wetland, trout stream)
10	5	Visible sheen or product on non-sensitive surface water area.
6	3	Exceedance of NR 102, 103 or 104 surface water quality standards.

Request assistance from District Water Resources staff in evaluating surface water impacts.

4. HYDROGEOLOGIC SETTING:

Points:

12 Permeable stratigraphy (gravel, sand, fractured bedrock or utilities capable of intercepting and directing flow) and groundwater within 25 feet of the ground surface.
10 Permeable stratigraphy and groundwater greater than 25 feet below ground surface.
8 Moderately permeable stratigraphy (silty sands, silty gravel, clayey sands) and groundwater within 25 feet of ground surface.
6 Moderately permeable stratigraphy and groundwater greater than 25 feet below ground surface.
4 Low permeability stratigraphy (silt, clayey silt, sand clays) and groundwater within 25 feet of ground surface.
2 Low permeability stratigraphy and groundwater greater than 25 feet below ground surface.

5. TYPE OF PRODUCT:

POINTS: FREE PRODUCT	DISSOLVED PRODUCT	
12	8	Gasoline, mixture of gasoline and other products, other light petroleum products.
10	6	Diesel, fuel oil.
6	2	Bunker oil, other heavy oils or crude fractions.

ERR LUST

Dr. Robert Purtock
675 Lake LaBelle Drive
Oconomowoc, WI 53066

Dear Dr. Purtock:

RE: CLOSURE for Purtock, Robert - property; 1430 S. 62nd St., West Allis, WI.

Based on the reports; *Results of Soil Analytical Testing* (January 7, 1993) and *Supplemental Soil Sampling and Analytical Testing* (August 26, 1994) prepared by Giles Engineering Associates, Inc. (Giles), the Wisconsin Department of Natural Resources (WDNR) has determined that no further action is necessary at the above referenced site.

You should note that this letter does not constitute Department "certification" under s. 144.765 (2) (a) 3, Stats., as created by 1993 Wisconsin Act 453 (May 12, 1994). Persons who meet the definition of "purchaser" in s. 144.765 (1) (c) must receive Department pre-approval prior to conducting a site investigation in order to be eligible for the liability exemption under s. 144.765, Stats.

The release was reported to the WDNR on October 26, 1992. One 1,000 gallon fuel oil Underground Storage Tank was removed and disposed of. Approximately 6.51 tons of contaminated soil was removed from the site and disposed of at Metro RDF in Franklin, WI.

If you have any questions about this letter or the site in general, please contact me at the letterhead address or at (414) 961-2787.

Printed on Recycled Paper

Sincerely,

Jerry W. Dawson

Subject: Supplemental Soil Sampling and Analytical Testing
Dr. Robert Purtock Residential Structure
1430 South 62nd Street
West Allis, Wisconsin
GEA Project No. 1E-940723

Dear Dr. Purtock:

In accordance with your request and subsequent authorization, Giles Engineering Associates, Inc. (GEA) collected a soil sample from the bottom of the former fuel oil underground storage tank (UST) excavation at the Purtock residential structure located at 1430 South 62nd Street, West Allis, Wisconsin to confirm the absence of petroleum-impacted soil at the base of the excavation. The location of the subject site is shown on Figure 1. This work was done at the request of Mr. Jerry Dawson of the Wisconsin Department of Natural Resources (WDNR). As you know, the services previously performed by GEA were documented in the *Results of Soil Analytical Testing* report (GEA Project No. 1E-921049, dated January 7, 1993).

The soil sample was collected by GEA after advancing a soil boring to beyond the fill/native soil interface to a depth of 13 to 15± feet utilizing a TerraProbe operated by GEA. The location of the soil boring is shown on Figure 2. Photographs of the drilling operations are included as Attachment 1 of this letter. A soil sample was collected at a depth of 13 to 15± feet (approximate bottom of former UST excavation limits) at the soil boring location and submitted under standard Chain-of-Custody procedures to EnChem, Inc., Green Bay, Wisconsin (WDNR Lab Certification No. 405132750) for laboratory analysis for diesel range organics (DRO). The sample collection, storage and transportation were performed in general accordance with ASTM and other applicable specifications. The analytical results and Chain-of-Custody form are included as Attachment 2 of this letter and summarized below.

GILES ENGINEERING ASSOCIATES, INC.

Sample ID	Depth (feet below grade)	DRO (mg/kg)
G-1	13-15±	7.2

The results of the analytical testing indicated a detectable level of DRO was measured in the soil confirmation sample (G-1) collected from the center bottom at a concentration level of 7.2 milligrams per kilogram (mg/kg). The measured DRO level does not exceed the proposed WDNR DRO interim soil closure guidelines of 250 mg/kg for non-permeable unconsolidated formations.

The location of the previous confirmation soil samples collected from the former fuel oil UST excavation are enclosed in Attachment 3; no detectable levels of DRO were measured in the north and south bottom of the excavation. Therefore, due to the results of the analytical testing performed for this study, in addition to the previous confirmation soil sample results, further exploration and soil sampling is not considered warranted. It is recommended that the WDNR issue closure on the subject site.

Very truly yours,

GILES ENGINEERING ASSOCIATES, INC.

RE: ROBERT PURTOCK CONTAMINATED SOIL DISPOSAL

In regards to our phone conversation on March 3, 1994 I am writing this letter to verify that the contaminated soil for Robert Purtock was disposed of at Metro Recycling & Disposal Facility.

I show in our records that it was only one load of soil disposed of on December 31, 1992 equaling 6.51 tons for Profile #MW003559.

If you have any other questions or need further information please call me at (414) 529-6180.

Thank you,

Lisa A Garner

City, State, Zip Code (Site Address): WEST ALLIS, WI 53193	Environmental Consulting Firm: GILES ENGINEERING
County in Which Site is Located: MILWAUKEE	DNR Site Identification Number: SED-2783 (from DNR correspondence)

SITE STATUS - Check all which apply, enter yards and gallons in the spaces provided. **Definitions are on back of page.**

___ Field Investigation - This site was still being investigated in the preceding calendar year to identify the extent of contamination.

___ Soil Excavation in preceding calendar year.
(Indicate cubic yards for each below.)

_____ yds^3 Landfilled
_____ yds^3 Mixed into asphalt
_____ yds^3 Thermal treatment process ("incineration")
_____ yds^3 Thinspead
_____ yds^3 Excavated and placed into active bioremediation
_____ yds^3 Landspread (Ch. NR 518, Wis. Adm. Code)
_____ yds^3 Placed in a stockpile awaiting treatment or disposal
_____ yds^3 Other: _____

___ In-situ (in place) Soil Treatment in preceding calendar year.
(Indicate systems active in 1992, regardless of the year started.)

_____ (est.) yds^3 Soil vapor extraction system
_____ (est.) yds^3 Natural (passive) contaminant biodegradation
_____ (est.) yds^3 Active bioremediation
_____ (est.) yds^3 Other: _____

___ Groundwater Treatment in preceding calendar year

_____ gals. Pumped and airstripped
_____ gals. Pumped and other aboveground treatment
Type of treatment unit - _____
_____ (est.) gals. Air sparging
_____ (est.) gals. Active groundwater bioremediation
_____ gals. Other: _____

___ Free Product Recovery - _____ gallons of petroleum product were removed from the water table at this site in the preceding calendar year.

Signature: Robert Purtock Date Signed: 6-30-93

X Site owner
___ Other (indicate your relationship to this site) _____

Please use this space and the back of the page to provide any additional information you would like the Department to have regarding the status of this site.

Thank You.

SPOKE WITH LAURIE EGRE REGARDING THE ABOVE SITE & REPORT (ENCLOSED). I WAS LED TO BELIEVE THIS IS ALL TAKEN CARE OF AFTER HEFTY FEE'S TO TANK REMOVAL SERVICE & GILES ENGINEERING. PLEASE FIND REPORT. HOPE ALL IS NOW DONE.

THANKS

Definitions:

FIELD INVESTIGATION - The initial investigation to determine the extent and degree of contamination in soil and groundwater was in progress.

SOIL EXCAVATION - Contaminated soil was excavated and stored, treated or disposed. This may be a partial or total response to contamination. This definition does not include removal of clean tank backfill material. Enter the cubic yards of soil which went to each destination.

LANDFILLED - Excavated contaminated soil was disposed of at a licensed landfill.

MIXED INTO ASPHALT - Excavated contaminated soil was mixed into asphalt as a plant which is permitted to accept petroleum contaminated soil.

THERMAL TREATMENT - Excavated contaminated soil was treated in a unit which heats soil to volatilize contaminants and controls emissions of contaminants to the atmosphere.

THIN SPREAD - Excavated contaminated soil was spread on an impermeable surface and remediated by exposure to the atmosphere and naturally occurring microbes.

ACTIVE BIOREMEDIATION - Oxygen and/or nutrients were added to soil or groundwater to promote the breakdown of contaminants by microbes. Active bioremediation may be an in-situ or ex-situ treatment method.

LANDSPREAD - Excavated contaminated soil was spread on the land surface to promote natural degradation of the contaminants through exposure to the atmosphere and naturally occurring microbes. Landspreading must be conducted in accordance with the requirements of Ch. NR 518, Wis. Adm. Code.

IN-SITU TREATMENT - Contaminated soil and/or groundwater was remediated without removal from its original location. Soil vapor extraction is an example of in-situ soil treatment .

SOIL VAPOR EXTRACTION - A system consisting of vapor recovery wells, pumps and, in some cases, an off-gas treatment system, was installed to remove contamination from the soil.

NATURAL BIODEGRADATION - The rate of natural breakdown of petroleum compounds by naturally occurring microbes in soil or groundwater was monitored.

GROUNDWATER TREATMENT - Contaminated groundwater was treated in compliance with applicable state and federal requirements to remove contaminants.

PUMPED AND AIRSTRIPPED - Contaminated groundwater was pumped from the aquifer and treated to remove the contaminants by mixing the water with air in a tower or other structure.

AIR SPARGING - Air was injected into the aquifer to move dissolved contaminants from groundwater into the air. Air sparging is usually used in conjunction with soil vapor extraction.

FREE PRODUCT - Liquid petroleum which was floating on the water table was removed by pumping.

Subject: Results of Soil Analytical Testing
Former Fuel Oil Underground Storage Tank
Purtock Residential Structure
1430 South 62nd Street
West Allis, Wisconsin
GEA Project No. 1E-921049

Dear Dr. Purtock:

In accordance with your request and subsequent authorization, Giles Engineering Associates, Inc. (GEA) collected soil samples from the excavation following removal of one fuel oil underground storage tanks (UST) at the above-referenced site. Select soil samples were subsequently submitted for analytical testing. A summary of the scope of services and the results of the analytical testing is presented below.

INTRODUCTION

The Purtock residential structure is located on South 62nd Street, in the City of West Allis, Milwaukee County, Wisconsin, and is referenced by the street address of 1430 South 62nd Street. The Purtock residential structure consists of a two-story brick mult-unit residential structure with a basement. Site location and features are shown on the following Figures 1 and 2, respectively.

One (1) 1,000± gallon capacity underground storage tank (UST) was removed from the subject site on October 23, 1992. The date of installation of the UST is unknown, as no records of this UST are present with the Wisconsin Department of Industry Labor and Human Relations (WDILHR). R-K Tank Removal provided on-site tank removal and excavation services.

AND CONSTRUCTION MATERIALS CONSULTANTS

Lieutenant Ronald Kling of the City of West Allis Fire Department was on-site to observe the removal of the UST. Following removal of the UST, close examination of the tank (including removal of rust scale) revealed a small hole at what was the south end of the tank while in-place. A small amount of soil (<0.25 yards) was excavated from this area of potential leakage prior to collection of laboratory confirmation soil samples.

GEA SITE VISIT

Mr. James J. Kubash of GEA, Wisconsin Department of Industry Labor, and Human Relations (WDILHR) Certified Site Assessor (No. 03526), arrived at the subject site on the afternoon of October 23, 1992 to collect soil samples from the excavation following removal of the underground storage tanks (UST). Observations at that time indicated that the former 1,000± gallon fuel oil UST was located at the northwest corner of the existing structure. The original tank excavation measured 9± feet long (in an east to west direction), 10± feet wide (in a north to south direction), and 11± feet deep. No groundwater or free product was observed within the former UST excavation. Site photographs dated October 23, 1992 are included as Appendix 1.

TANK AND SLUDGE DISPOSAL

The UST was being properly cleaned prior to planned removal from the property by R-K Tank Removal, Inc. Following removal, cleaning and dismantling, the tank was reportedly going to be transported to Miller Compression Company for recycling.

This tank had apparently been "abandoned in-place" at some point in the past, as it was found to be substantially full of pea gravel at the time of removal. During and following removal of this pea gravel, sludge was not found to be present in the UST. A sample of tank contents was collected for volatile organic vapor scan and analytical testing. Test results are included in Table 1 and 2.

SOIL SAMPLING AND VOLATILE VAPOR SCAN

Following removal of the UST on October 23, 1992, six (6) soil samples were collected by GEA from within the tank pit excavation. Sampling locations are depicted in Figure 2. One (1) soil sample was collected from pea gravel material found to be present within the UST. Samples of pea gravel (tank contents) were placed in a clean, laboratory-approved 1 quart glass jar with a plastic lid and new, laboratory-approved 8 ounce jar with a metal lid. The two different containers were utilized to provide adequate quantity of sample for Protocol D-1 Solid Waste Profile Analysis and Field HNU Volatile

E1049-2/BU12

Organic Compound Vapor Head Space Screening, respectively. Six (6) soil samples collected from within the tank pit excavation were placed in clean, laboratory-approved 4 ounce jars with Teflon® lids and new, laboratory-approved 8 ounce jars with metal lids covered with foil for Diesel Range Organic (DRO) laboratory analysis and field head space screening, respectively.

The soil samples collected in the 8 ounce jars were subjected to a head space volatile organic vapor scan utilizing a HNU Photoionization Detector (PID) equipped with 11.7 eV lamp calibrated to a Benzene standard. The volatile organic vapor scan technique is a screening method used to access the presence of volatile organic vapor emissions and the necessity for further exploration and analytical testing. The contents of the 8 ounce jars were agitated for 30± seconds prior to performing the volatile organic vapor scan. The probe of the HNU PID penetrated only the foil cover during the volatile organic vapor scan.

The results of the field screening indicated volatile organic vapor levels at concentrations below level of detection (BDL) in the soil samples collected from tank excavation and 90 HNU units in the pea-gravel sample collected within the tank. Soil sample locations, classification and results of the vapor scan are presented on the following Table 1.

ANALYTICAL TESTING AND RESULTS

Two of the collected soil samples were submitted for chemical analysis in the GEA analytical laboratory (WDNR Certification No. 368305180) for the presence and concentration levels of Diesel Range Organics (DROs) in accordance with the modified Wisconsin method. The results of analytical testing of Soil Sample No. BS and BN (collected from the southern and northern ends of the tank excavation bottom, respectively), indicated measured DRO levels of less than 10 milligrams per kilogram (mg/kg), which is equivalent to parts per million (ppm). The measured levels of DRO in soil samples collected within the excavation are below the current WDNR DRO guideline level of 10 ppm. Chain-of-Custody and laboratory analysis reports are included in Appendix 2.

Standard Protocol D-1 Solid Waste Profile Analysis was performed upon sample of pea gravel collected from within UST. Testing indicated that this material satisfied all requirement of landfill acceptance with the exception of DRO which slightly exceeded specified limit of 2,000 ppm with a measured concentration level of 2,500 ppm. Analytical DRO test results are summarized in Table 2. Chain-of-Custody and laboratory analysis reports are included in Appendix 2.

GILES ENGINEERING ASSOCIATES, INC.

The elevated DRO levels of the tank backfill was discussed with WDNR representatives whom approved a variance to allow for landfilling of this material based upon measured DROs slightly exceeding protocol limits, small quantity of material involved, and one-time nature of proposed disposal. A copy of the variance approval is included as Appendix 3.

RECOMMENDATIONS

Analytical testing of representative soil samples collected within the tank excavation indicate that WDNR DRO guidelines have not been exceeded. Based upon the results of analytical testing and observed site conditions, it is recommended that no further action is necessary at this site. Analytical testing of pea gravel removed from within the tank indicated DRO content in excess of WDNR guidelines. It is recommended that this material be properly disposed.

GEA appreciates the opportunity to be of continued service on this project. If there are any questions regarding the information contained herein, or if GEA can be of any additional service, please feel free to call Mr. James F. Drought or Mr. Robert R. Russell at your convenience.

SUBJECT—MESSAGE:

The Wisconsin Department of Natural Resources hereby Approves Landfilling of ± 3 yards of soil characterized by soil sample #3451 as documented by the attached preliminary Lab sheets. This approval/exemption is for the exceedance of DRO limits for Landfilling of petroleum contaminated soils. The LUST DRO limit for Landfilling soil is 2000 ppm. The soil sample #3451 was analyzed at 2500 ppm.

October 29, 1992

Mr. Robert Purtock
675 Lake Labelle Drive
Oconomowoc, WI 53066

Dear Mr. Purtock:

RE: Purtock Property - 1430 S. 62nd Street, West Allis, WI

Wisconsin Department of Natural Resources (WDNR) has been notified that petroleum contamination was discovered October 26, 1992 at the above referenced location. Based on the site specific information provided, this case has been assigned to the Medium Priority Rank group. The purpose of this letter is to inform you of your legal responsibilities to address this situation.

Releases from underground storage tanks regulated under Subtitle I of the Resource Conservation and Recovery Act require compliance with the provisions of 40 CFR Parts 280 and 281. The Environmental Protection Agency (EPA) has the authority to take enforcement action at any time, but will generally not take action against parties cooperating with the state. The WDNR proceeds in LUST cases under the authority of s. 144.76, Wisconsin Statutes, commonly referred to as Wisconsin's Hazardous Substance Spill Law. The definition of "hazardous substance" as found in s. 144.01(4m), Wisconsin Statutes, includes petroleum products.

Wisconsin Statute 144.76(2a) states: "A person who possesses or controls a hazardous substance which is discharged or who causes the discharge of a hazardous substance shall notify the Department immediately of any discharge not exempted under sub.(9)."

Wisconsin Statute 144.76(3) states: "A person who possesses or controls a hazardous substance which is discharged or who causes the discharge of a hazardous substance shall take the actions necessary to restore the environment to the extent practicable and minimize the harmful effects from the discharge to the air, lands, or waters of this state."

Because you possess or control a hazardous substance which has been released to the environment, the Department identifies you as the party responsible for taking the actions necessary to restore the environment. You are required to:

1. Immediately notify the WDNR Spills Hotline at (414) 263-8491 should emergency conditions involving explosive vapors and/or well contamination develop.

2. Conduct an investigation to determine the extent of soil and groundwater contamination.

3. Remediate all of the environmental impacts caused by this situation.

4. Sample private water supply wells which may have been impacted by the release.

The Department suggests that you have a qualified environmental engineer or hydrogeologist direct the remedial investigation, assess the environmental impact, and coordinate the implementation of a cleanup program. Within 15 days of receiving this letter, you should provide the WDNR with the date the remedial investigation will begin.

The Department requires that the location of the tank and/or release be submitted with the work plan. **Requirements for location are Latitude, Longitude, 1/4, 1/4, Township, and Range (east or west).**

Final documentation of the investigation and cleanup should be prepared according to the guidance enclosed and sent to this office on completion of compliance with all applicable federal, state and local laws and regulations. Remedial actions must adequately cleanup contaminated soil and/or groundwater to current WDNR guidelines and/or standards. All product, soil, wastewater, and sludge must be disposed of in compliance with all applicable federal, state and local laws and regulations. Because the Department is experiencing a backlog of leaking underground storage tank cases of emergency status and your case is not currently ranked as an emergency, your submittals will be reviewed as time permits. Investigation and cleanup should not, however, be delayed pending WDNR review of your case.

The WDNR requests that concise LUST project updates be submitted every six months for all medium priority sites; biannual updates will enable WDNR project managers to monitor the status of remedial investigations and/or corrective actions on projects which are not under direct WDNR oversight.

You are encouraged to contact the Department of Industry, Labor, and Human Relations (DILHR), the state agency that administers the Petroleum Environmental Cleanup Fund (PECFA). This fund may reimburse you for eligible costs associated with the remedial investigation and cleanup. DILHR should be contacted at (608) 267-4545 to obtain current information regarding the PECFA program.

Please be aware that your ability to utilize PECFA funds will be dependent on your cooperation in adequately addressing this problem.

Sincerely,

Giselle Red

LUST CASE PRIORITY SCREENING WORKSHEET

HIGH FACTORS: (DEFINITION: Any case which presents an actual threat to human health, or has a high potential of causing a threat to human health and property; and/or any case which has caused or has a high potential of causing substantial impacts to the soil waters and air of the State of Wisconsin.

____ Contaminated private or public well >NR140 enf. std.
____ Explosive or toxic vapors in structures
____ Threat of fire

HIGH OR MEDIUM FACTORS: (write in choice of high or medium)
____ Floating product (medium if no receptors within 1 mile)
____ Known gw contamination (private or public well <140 enf. std.)
____ Impacted surface water - -wetland, trout stream, etc. impacted
____ Saturated soil contamination

MEDIUM FACTORS: (DEFINITION: Any case which does not appear to be an immediate threat to human health or vital natural resources but which shows levels of contamination that may cause substantial environmental impacts if left unaddressed.)

____ Moderate (e.g. 100 - 500 ppm TPH) soil contamination with moderate potential for impacting groundwater.
____ Impacted surface water - - no critical habitat threats.

LOW FACTORS: DEFINITION: Any case where contamination has been documented, but which presents limited potential for any immediate threat to human health and vital natural resources.)

____ Soil contamination (e.g. less than 100 ppm TPH) which appears to have a limited potential for impacting groundwater.
____ Initial remedial action has substantially reduced environmental threat.

UNKNOWN FACTOR: (DEFINITION: Any case where some indication of contamination is present, but due to incomplete or inaccurate information the level of threat to human health or the environment can not be assessed at this time.)

____ Inadequate information to assign a high, medium, or low ranking.

OVERALL RANKING: The screening rank for the site along with the date of ranking. This may be updated when additional information is received. Special circumstances for a particular case may be taken into account in the comment section. The District LUST coordinator may independently set the ranking of a site based upon "special circumstances."

Circle one & date, indicate in priority screening box opposite side _____ HIGH _____ MEDIUM _____ LOW _____ UNKNOWN

Overall Site Comment:

_____

NUMERICAL LUST SCORING WORKSHEET (Complete for LUST cases ranked HIGH)

1. GROUNDWATER & SOILS: (circle one)

POINTS	
20	Municipal Well
18	>5 private wells
16	4 - 6 private wells
14	2 - 3 private wells
12	1 private well

_____ SCORE

POINTS	
8	Soil & gw within 1200' of a public well
6	Soil & gw within 1200' of one or more private wells
4	GW contamination, no wells within 1200'
2	Soil contamination

*For purposes of this scoring, private well includes any non-municipal water supply system.

2. EXPLOSIVE OR TOXIC VAPORS: (circle one)

POINTS CONFIRMED	POTENTIAL	
20	10	Explosive levels in a residence or building
	8	Explosive levels in a sewer or structure
12	6	Toxic levels in a residence or building

NOTE: Explosive levels determined to be >20% LEL as per an explosivity meter; toxicity levels are based on OSHA permissible exposure limits (PEL)

_____ SCORE

3. HYDROGEOLOGIC SETTING: (circle one)

POINTS	
12	Permeable stratigraphy (gravel, sand, fractured bedrock or utilities capable of intercepting and directing flow) and groundwater within 25 feet of the ground surface.
10	Permeable stratigraphy and groundwater greater than 25 feet below ground surface.
8	Moderately permeable stratigraphy (silty sands, silty gravel, clayey sands) and groundwater within 25 feet of ground surface.
6	Moderately permeable stratigraphy and groundwater greater than 25 feet below ground surface.
4	Impermeable stratigraphy (silt, clayey silt, sand clays) and groundwater within 25 feet of ground surface.
2	Impermeable stratigraphy and groundwater greater than 25 feet below ground surface.

_____ SCORE

4. TYPE OF PRODUCT: (circle one)

POINTS	
8	Gasoline, mixture of gasoline and other products, other light petroleum products.
6	Diesel, fuel oil

GIS Registry Checklist

Form 4400-245 (R 3/10)

This Adobe Fillable form is intended to provide a list of information that is required for evaluation for case closure. It is to be used in conjunction with Form 4400-202, Case Closure Request. The closure of a case means that the Department has determined that no further response is required at that time based on the information that has been submitted to the Department.

NOTICE: Completion of this form is mandatory for applications for case closure pursuant to ch. 292, Wis. Stats. and ch. NR 726, Wis. Adm. Code, including cases closed under ch. NR 746 and ch. NR 726. The Department will not consider, or act upon your application, unless all applicable sections are completed on this form and the closure fee and any other applicable fees, required under ch. NR 749, Wis. Adm. Code, Table 1 are included. It is not the Department's intention to use any personally identifiable information from this form for any purpose other than reviewing closure requests and determining the need for additional response action. The Department may provide this information to requesters as required by Wisconsin's Open Records law [ss. 19.31 - 19.39, Wis. Stats.].

BRRTS #: 0241543660, 0241543659 PARCEL ID #:

ACTIVITY NAME: Properties No. 102 and 113 WTM COORDINATES: E 683478 N 284494 E 683515 N 284526

CLOSURE DOCUMENTS (the Department adds these items to the final GIS packet for posting on the Registry)

☒ **Closure Letter**

☐ **Maintenance Plan** (*if activity is closed with a land use limitation or condition (land use control) under s. 292.12, Wis. Stats.*)

☐ **Continuing Obligation Cover Letter** (for property owners affected by residual contamination and/or continuing obligations)

☐ **Conditional Closure Letter**

☐ **Certificate of Completion (COC)** (for VPLE sites)

SOURCE LEGAL DOCUMENTS

☒ **Deed:** The most recent deed as well as legal descriptions, for the **Source Property** (where the contamination originated). Deeds for other, off-source (off-site) properties are located in the **Notification** section.
Note: *If a property has been purchased with a land contract and the purchaser has not yet received a deed, a copy of the land contract which includes the legal description shall be submitted instead of the most recent deed. If the property has been inherited, written documentation of the property transfer should be submitted along with the most recent deed.*

☒ **Certified Survey Map:** A copy of the certified survey map or the relevant section of the recorded plat map *for those properties where the legal description in the most recent deed refers to a certified survey map or a recorded plat map.* (lots on subdivided or platted property (e.g. lot 2 of xyz subdivision)).

Figure #: **Title:**

☒ **Signed Statement:** A statement signed by the Responsible Party (RP), which states that he or she believes that the attached legal description accurately describes the correct contaminated property.

MAPS (meeting the visual aid requirements of s. NR 716.15(2)(h))

Maps must be no larger than 11 x 17 inches unless the map is submitted electronically.

☒ **Location Map:** A map outlining all properties within the contaminated site boundaries on a U.S.G.S. topographic map or plat map in sufficient detail to permit easy location of all parcels. If groundwater standards are exceeded, include the location of all potable wells within 1200 feet of the site.
Note: *Due to security reasons municipal wells are not identified on GIS Packet maps. However, the locations of these municipal wells must be identified on Case Closure Request maps.*

Figure #: 1 **Title: Site Location Map**

☒ **Detailed Site Map:** A map that shows all relevant features (buildings, roads, individual property boundaries, contaminant sources, utility lines, monitoring wells and potable wells) within the contaminated area. This map is to show the location of all contaminated public streets, and highway and railroad rights-of-way in relation to the source property and in relation to the boundaries of groundwater contamination exceeding a ch. NR 140 Enforcement Standard (ES), and/or in relation to the boundaries of soil contamination exceeding a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Levels (SSRCL) as determined under s. NR 720.09, 720.11 and 720.19.

Figure #: 2, 3 **Title: Figure 2 Pre-Redevelopment Site Layout; Figure 3 Redevelopment Site Layout**

☒ **Soil Contamination Contour Map:** For sites closing with residual soil contamination, this map is to show the location of all contaminated soil and a single contour showing the horizontal extent of each area of contiguous residual soil contamination that exceeds a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Level (SSRCL)as determined under s. NR 720.09, 720.11 and 720.19.

Figure #: 4, 5 **Title: Figure 4 Soil DRO, GRO, and VOC Analytical Results; Figure 5 Excavation Limits**

BRRTS #: 0241543660, 0241543659 ACTIVITY NAME: Properties No. 102 and 113

MAPS (continued)

☐ **Geologic Cross-Section Map:** A map showing the source location and vertical extent of residual soil contamination exceeding a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Level (SSRCL). If groundwater contamination exceeds a ch. NR 140 Enforcement Standard (ES) when closure is requested, show the source location and vertical extent, water table and piezometric elevations, and locations and elevations of geologic units, bedrock and confining units, if any.

Figure #: **Title:**

Figure #: **Title:**

☒ **Groundwater Isoconcentration Map:** For sites closing with residual groundwater contamination, this map shows the horizontal extent of all groundwater contamination exceeding a ch. NR140 Preventive Action Limit (PAL) and an Enforcement Standard (ES). Indicate the direction and date of groundwater flow, based on the most recent sampling data.
Note: *This is intended to show the total area of contaminated groundwater.*

Figure #: 7 **Title: Groundwater Dissolved Metal Analytical Results**

☒ **Groundwater Flow Direction Map:** A map that represents groundwater movement at the site. If the flow direction varies by more then 20° over the history of the site, submit 2 groundwater flow maps showing the maximum variation in flow direction.

Figure #: 8 **Title: Groundwater Contour Map, February 23, 2001**

Figure #: **Title:**

TABLES (meeting the requirements of s. NR 716.15(2)(h)(3))

Tables must be no larger than 11 x 17 inches unless the table is submitted electronically. Tables must not contain shading and/or cross-hatching. The use of **BOLD** or *ITALICS* is acceptable.

☒ **Soil Analytical Table:** A table showing remaining soil contamination with analytical results and collection dates.
Note: This is one table of results for the contaminants of concern. Contaminants of concern are those that were found during the site investigation, that remain after remediation. It may be necessary to create a new table to meet this requirement.

Table #: 1 through 6 **Title: Soil DRO, GRO, VOC, PVOC, PAH, Benzo(a)pyrene Equivalent RCL, Metal, PCB**

☒ **Groundwater Analytical Table:** Table(s) that show the most recent analytical results and collection dates, for all monitoring wells and any potable wells for which samples have been collected.

Table #: 7 through 9 **Title: VOC, PAH, Dissolved Metal**

☒ **Water Level Elevations:** Table(s) that show the previous four (at minimum) water level elevation measurements/dates from all monitoring wells. If present, free product is to be noted on the table.

Table #: 10 **Title: Groundwater Elevations**

IMPROPERLY ABANDONED MONITORING WELLS

For each monitoring well not properly abandoned according to requirements of s. NR 141.25 include the following documents.
Note: *If the site is being listed on the GIS Registry for only an improperly abandoned monitoring well you will only need to submit the documents in this section for the GIS Registry Packet.*

☒ **Not Applicable**

☐ **Site Location Map:** A map showing all surveyed monitoring wells with specific identification of the monitoring wells which have not been properly abandoned.
Note: *If the applicable monitoring wells are distinctly identified on the Detailed Site Map this Site Location Map is not needed.*

Figure #: **Title:**

☐ **Well Construction Report:** Form 4440-113A for the applicable monitoring wells.

☐ **Deed:** The most recent deed as well as legal descriptions for each property where a monitoring well was not properly abandoned.

☐ **Notification Letter:** Copy of the notification letter to the affected property owner(s).

BRRTS #: 0241543660, 0241543659 ACTIVITY NAME: Properties No. 102 and 113

NOTIFICATIONS

Source Property

☒ **Not Applicable**

☐ **Letter To Current Source Property Owner:** If the source property is owned by someone other than the person who is applying for case closure, include a copy of the letter notifying the current owner of the source property that case closure has been requested.

☐ **Return Receipt/Signature Confirmation:** Written proof of date on which confirmation was received for notifying current source property owner.

Off-Source Property

Group the following information per individual property and label each group according to alphabetic listing on the "Impacted Off-Source Property" attachment.

☒ **Not Applicable**

☐ **Letter To "Off-Source" Property Owners:** Copies of all letters sent by the Responsible Party (RP) to owners of properties with groundwater exceeding an Enforcement Standard (ES), and to owners of properties that will be affected by a land use control under s. 292.12, Wis. Stats.
Note: *Letters sent to off-source properties regarding residual contamination must contain standard provisions in Appendix A of ch. NR 726.*

Number of "Off-Source" Letters:

☐ **Return Receipt/Signature Confirmation:** Written proof of date on which confirmation was received for notifying any off-source property owner.

☐ **Deed of "Off-Source" Property:** The most recent deed(s) as well as legal descriptions, for all affected deeded **off-source property(ies).** This does not apply to right-of-ways.
Note: *If a property has been purchased with a land contract and the purchaser has not yet received a deed, a copy of the land contract which includes the legal description shall be submitted instead of the most recent deed. If the property has been inherited, written documentation of the property transfer should be submitted along with the most recent deed.*

☐ **Letter To "Governmental Unit/Right-Of-Way" Owners:** Copies of all letters sent by the Responsible Party (RP) to a city, village, municipality, state agency or any other entity responsible for maintenance of a public street, highway, or railroad right-of-way, within or partially within the contaminated area, for contamination exceeding a groundwater Enforcement Standard (ES) and/or soil exceeding a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Level (SSRCL).

Number of "Governmental Unit/Right-Of-Way Owner" Letters:

Mr. Helmut Toldt
Toldt Development, Inc
4040 N Calhoun Road
Brookfield, WI 53005

Subject: Final Case Closure for Properties 102 and 113 (a.k.a. Former Pressed Steel Tank – Parking Lot Property), located at 1452 S 66th Street and 1441 S 65th Street, West Allis, WI

Dear Mr. Toldt:

On September 17, 2010, the Wisconsin Department of Natural Resources (WDNR) reviewed your request for closure of the case described above. The WDNR reviews environmental remediation cases for compliance with state rules and statutes to maintain consistency in the closure of these cases.

Based on the correspondence and data provided, it appears that your case meets the closure requirements in ch. NR 726, Wisconsin Administrative Code. The Department considers this case closed and no further investigation or remediation is required at this time, however, you and future property owners must comply with certain continuing obligations as explained in this letter.

Please be aware that this case may be reopened pursuant to s. NR 726.09, Wisconsin Administrative Code, if additional information regarding site conditions indicates that contamination on or from the site poses a threat to public health, safety or welfare, or the environment.

GIS Registry

The conditions of case closure set out below in this letter require that your site be listed on the Remediation and Redevelopment Program's GIS Registry. The specific reason is summarized below:

- Residual soil contamination exists that must be properly managed should it be excavated or removed (Property 102 -1452 S 66th Street)

This letter and information that was submitted with your closure request application will be included on the GIS Registry. To review the sites on the GIS Registry web page, visit the RR Sites Map page at http://dnr.wi.gov/org/aw/rr/gis/index.htm. If your property is listed on the GIS Registry because of remaining contamination and you intend to construct or reconstruct a well, you will need prior Department approval in accordance with s. NR 812.09(4)(w), Wis. Adm.

Code. To obtain approval, Form 3300-254 needs to be completed and submitted to the DNR Drinking and Groundwater program's regional water supply specialist. This form can be obtained on-line http://dnr.wi.gov/org/water/dwg/3300254.pdf or at the web address listed above for the GIS Registry.

Residual Soil Contamination

Approximately 32 tons of diesel range organic (DRO) impacted residual soil contamination remains at the site in the area of soil boring AGMSB-9 as indicated **on the attached map** and in the information submitted to the Department of Natural Resources. The area of soil contamination is currently beneath parking lot pavement. If soil in the specific location described above is excavated in the future, then pursuant to ch. NR 718 or, if applicable, ch. 289, Stats., and chs. 500 to 536, the property owner at the time of excavation must sample and analyze the excavated soil to determine if residual contamination remains. If sampling confirms that contamination is present the property owner at the time of excavation will need to determine whether the material is considered solid or hazardous waste and ensure that any storage, treatment or disposal is in compliance with applicable standards and rules. In addition, all current and future owners and occupants of the property need to be aware that excavation of the contaminated soil may pose an inhalation or other direct contact hazard and as a result special precautions may need to be taken to prevent a direct contact health threat to humans.

The Department appreciates your efforts to restore the environment at this site. If you have any questions regarding this closure decision or anything outlined in this letter, please contact Andy Boettcher at (414) 263-8541.

Sincerely,

Andrew F Boettcher
SER Hydrogeologist

SURVEYOR'S CERTIFICATE

STATE OF WISCONSIN)
MILWAUKEE COUNTY) SS

I, William R. Henrichs, Registered Land Surveyor, do hereby certify:

That I have surveyed, mapped and divided All of Block 2, in C. A. Maynard & Agnew's Subdivision No. 3, Being a part of the Northwest 1/4 of the Northeast 1/4 of Section 3, Township 6 North, Range 21 East, in the City of West Allis, Milwaukee County, Wisconsin, which is bounded and described as follows:

Commencing at the Northwest corner of said Northeast 1/4;
Thence N 88°05'31"E along the North line of said Northeast 1/4 and the centerline of West Greenfield Avenue, a distance of 819.03 feet;
Thence S 01°53'33"E, a distance of 33.00 feet to the South right-of-way line of West Greenfield Avenue and the POINT OF BEGINNING;
Thence N 88°05'31"E along said South right-of-way line, a distance of 246.00 feet to a point on the West right-of-way line of South 65th Street;
Thence S 01°53'33"E along said West right-of-way line, a distance of 468.65 feet to the North right-of-way line of West National Avenue;
Thence S 57°20'37"W along said North right-of-way line, a distance of 281.29 feet;
Thence N 62°16'28"W along said North right-of-way line, a distance of 4.94 feet to the East right-of-way line of South 66th Street;
Thence N 01°53'33"W along said East right-of-way line, a distance of 610.02 feet to the South right-of-way line of West Greenfield Avenue and the POINT OF BEGINNING.

Containing 133,280 square feet or 3.0597 acres.

That I have made such survey, land division and map by the direction of Toldt Development, Inc., owner of said land.

That such plat is a correct representation of all the exterior boundaries of the land surveyed and the land division thereof made.

That I have fully complied with the provisions of Chapter 236 of the Wisconsin State Statutes and the City of West Allis in surveying, mapping and dividing the same.

Toluene	<35	<33	<34	<34	<22	<20	<21	<20	<20	<34	<33
Xylenes, Total	<94	<88	<91	<92	<64	<59	<59	<58	<58	<91	<90

Methylene chloride is a common laboratory contaminant and thus not evaluated.

100	Concentration exceeds the NR 720 RCL.
100	Concentration exceeds the NR 746 RCL (indicator of of residual petroleum product in soil pores).
(a)	Add isomers together before comparing to criteria.
*	Napthalene in check standard is 134 percent.
DRO	Diesel Range Organics.
H	Late eluding hydrocarbon.
µg/kg	Micrograms per kilogram.
mg/kg	Milligrams per kilogram.
NA	Not analyzed.
NE	Not established.
RCL	Residual contaminant level.
SSL	Soil Screening Level.
VOC	Volatile Organic Compounds.

Table 3. Benzo(a)pyrene Equivalent Residual Contaminant Level Calculations and Results, Former Pressed Steel Company Parking Lot Property, West Allis, Wisconsin.

Risk-Based Algorithms for Soil Ingestion

The default exposure factors used for direct ingestion of contaminated soil are those specified in s. NR 720.19(5), Wis. Adm. Code.
The value for non-industrial and industrial exposure are the same as the default values used by U.S. EPA in the soil screening in level methodology (U.S. EPA 1996). (1)

Algorithm for Ingestion of Carcinogenic Contaminants in Non-Industrial Soil

Target Cancer Risk Level, TR (unitless)	1.00E-07		
Combined Target Cancer Risk Level for *in situ* contaminated soil	1.00E-05	Average Body Weight from, Age 1-6, BWc (kg)	15
Averaging Time, AT (yr)	70	Ingestion Rate of Soil Age 7-31, IRa (mg/d)	100
Exposure Frequency, EF (d/yr)	350	Exposure Duration from Age 7-31, EDa (yr)	24
Age-adjusted Soil Ingestion Factor, IFs (mg*yr/kg*d)	34	Average Adult Body Weight, BWa (kg)	70
Ingestion Rate of Soil Age 1-6, IRc (mg/d)	200		

Benzo(a)pyrene equivalent concentration - RCL ingestion, all PAHs detected, non-industrial

$$\text{RCL} = \frac{\text{TR} \times \text{AT} \times 365\ \text{day/year}}{\text{SFo} \times 10^{-6}\ \text{kg/mg} \times \text{EF} \times \text{IFs}}$$

$$\text{RCL} = \frac{(1*10^{-5})*70*365}{(7.3*10^{-6})*350*114} = \frac{0.2555}{0.29127}$$

= 0.88 mg/kg or 880 µg/kg

Algorithm for Ingestion of Carcinogenic Contaminants in Industrial Soil

Target Cancer Risk Level, TR (unitless)	1.00E-06	Exposure Duration, ED (yr)	25
Combined Target Cancer Risk Level for *in situ* contaminated soil	1.00E-05	Average Adult Body Weight, BWa (kg)	70
Averaging Time, AT (yr)	70		
Exposure Frequency, EF (d/yr)	250		
Ingestion Rate of Soil for Adult, IRa (mg/d)	100		

Benzo(a)pyrene equivalent concentration - RCL ingestion, all PAHs detected, industrial

$$\text{RCL} = \frac{\text{TR} \times \text{BWa} \times \text{AT} \times 365\ \text{day/year}}{\text{SFo} \times 10^{-6}\ \text{kg/mg} \times \text{EF} \times \text{ED} \times \text{IRa}}$$

$$\text{RCL} = \frac{(1*10^{\wedge -5})*70*70*70*365}{(7.3*10^{\wedge -6})*250*25*100} = \frac{17.885}{4.5625}$$

= 3.9 mg/kg or 3,900 µg/kg

Milwaukee, WI 53214
Contact: Edward Diesch

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Graef were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.
