CORRESPONDENCE/MEMORANDUM

Date: April 15, 2020

To: Traci Gengler, City of West Allis

From: Steve Huberty, Project Manager
GRAEF

Subject: PHASE I HAZARDOUS MATERIAL REPORT
Project I.D.: 2410-13-00
Roadway: W. National Avenue
Termini: S. 62nd Street to S. 65th Street
Highway Number or indicate if local road: Local Road
County: Milwaukee

The Phase I Hazardous Material Report and its supporting exhibits for the above-mentioned project has been reviewed and approved by the City of West Allis.

Approved:

1. EXECUTIVE SUMMARY

1.1.1. Project Description

The W. National Avenue reconstruction project from S. 65th Street to S. 62nd Street is located in Section 3 of Township 06 North, Range 21 East in Milwaukee County, Wisconsin. The project consists of the reconstruction of approximately 0.2 miles of this two-lane major arterial roadway, in the city of West Allis, that has a parking lane on both sides of the street. The units of government responsible for the project are the Wisconsin Department of Transportation and the City of West Allis.

The project proposes to reconstruct the existing roadway and base, replace storm sewer, sanitary sewer, and water main in the project limits. Additional work includes full sidewalk replacement, grading from right-of-way to right-of-way, incorporation of streetscaping elements, new pavement marking and permanent signing. Temporary Limited Easements (TLE's) will be acquired from all fronting parcels to tie the improvements into the front yards and building fronts (approximately 5 feet to 10 feet maximum). No permanent right-of-way acquisition is anticipated to be needed at this time. The Project Construction ID is 2410-13-70. The maximum excavation depths are estimated to be 3 feet for roadway improvements, and 6 to 12 feet for the replacement of storm sewer, water main, and sanitary sewer improvements in the project corridor.

This Phase I Hazardous Materials Assessment was completed to satisfy environmental documentation requirements, to limit WisDOT's environmental liabilities, avoid costly construction emergencies and delays and to address worker safety during construction. The scope of work for the Phase I Hazardous Materials was based on procedures specified in the Wisconsin Department of Transportation (WisDOT) Facilities Development Manual, Chapter 21. This Phase 1 Hazardous Materials Assessment pertains only to the project corridor on the attached Figure 1 and will be referred to as the project corridor throughout this assessment report. Preliminary plan details and plan & profiles of the project are included in Appendix A.

1.1.2. Findings

Two sites were identified adjacent to the project corridor that could affect the project. WDNR Files were reviewed for these sites if they were available. These sites included:

- COD Plumbing Supply Inc. site located at 6203 W. National Avenue, Station 14+20 to 14+70 (**Site 1)** is listed on the ERP database and was opened by the Wisconsin Department of Natural resources in 1997. The site to the south (Viking Communications) has gasoline and fuel oil contamination that extends onto the site. The site is also shown on a 1927 Sanborn map as a gasoline station with gas tanks. Soil contamination could be present in the right-of-way. A Phase 2.0 site investigation is recommended in this area.

- Viking Land Mobile Communications Inc. site located at 1421 S. 62nd Street., Station: 13+50 to 14+20 (**Site 2)** is a LUST Site that was closed by the WDNR in 2009. The site has soil and ground water contamination. The site has contamination adjacent to the right-of-way. Soil contamination could be present in the right-of-way. A Phase 2.0 site investigation is recommended.

- The Three Pressed Steel Tank Site are closed with potential residual contamination in the right-of-way – 1441 S. 65th Street, and 1452 S. 66th Street with two separate occurrences. The intersection of S. 65th Street and W. National Avenue was previously reconstructed during a different project. Special Provisions - If contamination is encountered during work in these areas notify the engineer.

2. PHASE 1 HAZARDOUS MATERIALS ASSESSMENT OBJECTIVES AND SCOPE

The purpose of the Phase 1 Hazardous Materials Assessment was to identify parcels in the proximity of the project corridor that may have environmental concerns; and provide recommendations for additional investigations necessary to further assess these potential environmental impacts. Sites were reviewed within a radius of one-quarter mile of the project corridor. This report presents the findings of the Phase 1 Reconnaissance and Record Search as well as recommendations. The scope of work for the Phase 1 Hazardous Materials Assessment was based on procedures specified in the Wisconsin Department of Transportation (WisDOT) Facilities Development Manual, Chapter 21. The scope of work consisted of the following tasks:

- A review of federal, state, and local regulatory agency databases;
- Identification of other potential sources of contamination upon visual inspection of

the project corridor;

- Recommendations for further investigation; and+
- Preparation of the Phase 1 Hazardous Material Assessment Report.

3. PROJECT CORRIDOR INFORMATION

3.1 Jurisdiction

The W. National Avenue project corridor extends from S. 65th Street to S. 62nd Street, located south of IH-94. The project limits fall within the local municipal boundaries of the City of West Allis, Milwaukee County. Wisconsin Department of Transportation and the City of West Allis are the units of government responsible for the project.

3.2 Land Use

Land use adjacent to the project corridor includes a mix of commercial, residential, limited industrial properties, and apartment buildings. Intersecting roadways with W. National Avenue include: S. 65th Street, S. 64th Street, S. 63rd Street, S. 62nd Street, and W. Greenfield Avenue.

3.3 Physical Site Settings

3.3.1 Size and Shape of Parcel

The project corridor extends along W. National Avenue from S. 65th Street to S. 62nd Street, approximately 0.2 miles long and is rectangular in shape. The existing right-of-way width is 66'. The existing roadway width is 46' from face of curb to face of curb.

3.3.2 Surface Elevation and Topography

The project corridor is located in an area of grading and filling completed for construction of a municipal roadway. Surface elevations within the east-west project corridor, based on the city of West Allis datum, range from approximately 145' (west) to 120' (east) feet above mean sea level (msl), representing an eastward surface gradient.

3.3.3 Soils, and Geology

The project corridor is in an area where no detailed mapping has been performed by the US Department of Agricultural. The general soil map for Milwaukee County describes the area

as belonging to the Ozaukee-Morley-Mequon Soil Association. These soils are well drained to somewhat poorly drained that have a subsoil of clay to clay loam formed in silty clay loam glacial till on moraines.

The glacial geology of the immediate area consists of Quaternary Age glacial lake deposits consisting mainly of silt and clay. Thicknesses of the unconsolidated glacial sediments are mapped at approximately 100-150 feet thick.

Bedrock beneath the project corridor is approximately 100-150 feet below grade based on published information. The uppermost sedimentary bedrock is Silurian Age dolomites of the Niagara formation. Beneath the Silurian Age dolomites are Ordovician Shales of the Maquoketa Formation. These shales provide a barrier between the shallow and deep bedrock aquifer. The sedimentary bedrock units function as a regional aquifer as described briefly below.

3.3.4 Hydrology and Hydrogeology

The project is located within the Kinnickinnic River watershed, which drains eastward into Lake Michigan. Storm water at the site is controlled by storm water management features including curb & gutter and inlets that route the runoff into the existing storm sewer system that conveys the flows away from the site.

The direction of local shallow ground water is variable and is likely eastward towards the Kinnickinnic River. The direction of shallow ground water flow can be complicated by local surface water features such as storm water ponds, wetlands, ditches, and swales, which can add or remove water from the ground water system. Based on the published information, the shallow water table in the glacial sediments is likely between 5 to 15 feet below ground surface. The regional direction of ground water flow in the combined dolomite and glacial aquifers is likely eastward towards Lake Michigan.

The shallow bedrock aquifer consists of Silurian Age dolomite. Locally, there is a mantle of glacial lake sediments covering the shallow bedrock aquifer. Based on available information, the sediments are interpreted to be approximately 100-150 feet thick and should provide a reasonable measure of protection from surface spills impacting the shallow bedrock aquifers.

4 SOURCES OF ENVIRONMENTAL INFORMATION

4.1 Environmental Data Resources, Inc.

4.1.1 Introduction

Published Federal, State, Local and Proprietary environmental databases were searched and compiled by Environmental Data Resources, Inc. (EDR) for properties listed within the specified search distances from the project corridor. GRAEF personnel reviewed information provided by EDR for the potential presence of nearby sources of environmental contamination. The summary section of the EDR report and a copy of the entire report on an electronic disk is included in Appendix C. The database review included the following:

- National Priorities List (NPL), USEPA CERCLIS subset of uncontrolled or abandoned hazardous waste sites
- Delisted NPL
- Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS), USEPA inventory of reported potential hazardous waste site
- Corrective Action Report (CORRACTS)
- RCRA – Treatment, Storage and Disposal (RCRA-TSDF)
- Federal RCRA generators List, RCRA – Large Quantity Generators (RCRA – LQG), RCRA – Small Quantity Generators (RCRA – SQG), RCRA – Conditionally Exempt Small Quantity Generator (RCRA – CESQG)
- Federal institutional controls / engineering controls registries, Engineering Controls Sites List (US ENG Controls), Sites with Institutional Controls (US INT CONTROL), Land Use Control Information System (LUCIS)
- Emergency Response Notification System (ERNS)
- State Hazardous Waste Sites (SHWS),
- Registry of Waste Disposal Sites In Wisconsin WDS
- Solid Waste Facilities / Landfill Sites (SWF), WDNR list of solid waste disposal facilities or landfills
- Wisconsin Department of Agriculture, Trade and Consumer Protection (DATCP) Storage Tank Database
- Wisconsin Leaking Underground Storage Tanks list- LUST
- WI Spills

- RCRIS-Small and Large Quantity Generators
- Leaking Underground Storage Tank (LUST)
- Leaking Aboveground Storage Tank Listing (LAST)
- Leaking Underground Storage Tank on Indian Land (INDIAN LUST)
- Registered Underground Storage Tanks (UST)
- Tank Database (AST)
- Underground Storage Tank on Indian Land (INDIAN UST)
- Underground Storage Tank Listing (FEMA UST)
- Closed Remedial Sites (CRS)
- Deed Restriction at Closed Sites (AUL)
- Voluntary Party Liability Exemption Sites (VCP)
- Brownfields Environmental Assessment Program (BEAP)
- Brownfields Site Locations Listing (BROWNFIELDS)
- Hazardous Materials Information System (HRMIS)
- Spill Database (SPILLS)
- Agricultural Spill Cases (AGSPILLS)
- RECRA – Non Generators (RECRA-NonGen)

The EDR Report identified the following databases with sites as having potential environmental risks within ¼ mile of the project corridor.

Database	**Search Distance (miles)**	**1/8 – 1/4 mile**
Standard Environmental Records		
Federal RCRA generators RCRA-LQG list		
RCRA-VSQG	0.250	2
State- and tribal - equivalent CERCLIS		
WI ERP	0.500	3
State and tribal landfill and/or solid waste disposal site lists		
WI WDS	0.500	0
WI SHWIMS	0.500	5
State and tribal leaking storage tank lists		

WI LAST	0.500	0
WI LUST	0.500	4
State and tribal registered storage tank lists		
WI UST	0.250	9
WI AST	0.250	0
State and tribal institutional control / engineering control registries		
WI AUL	0.500	1
Local BROWNFIELDS Lists		
WI Brownfields	0.500	0
US BROWNFIELDS	0.500	1
Records of Emergency Release Reports		
WI SPILLS	0.001	0
Other Ascertainable Records		
RCRA Non Gen / NLR	0.250	3
FINDS	0.001	0
WI MANIFESTS	0.250	1
EDR HIGH RISK HISTORICAL RECORDS		
EDR Exclusive Records		
EDR HIST AUTO	0.125	1
EDR HIST CLEANER	0.125	0
Totals		32

NR = Not Requested at this search distance.

The following sections include only sites in the text within one eighth to one quarter mile of the project corridor with conditions that could affect the project corridor.

4.1.2 Leaking Underground Storage Tanks LUST Sites

Wisconsin and/or Tribal Leaking Underground Storage Tanks (LUST) List, Leaking Aboveground Storage Tanks (LAST) List, and Emergency Repair Program (ERP) Database.

The LUST/LAST lists are inventories of reported spills and leaks, both active and inactive. It includes stationary and non-stationary source spills reported to state, tribal and federal agencies,

including remediated and contaminated leaking UST/AST sites. The ERP database is an inventory of non-LUST/LAST sites with contaminated soil and/or groundwater.

Site Name	Address	Contamination	Site Status [1.]	Listed on Table 1 Appendix B Hazardous Materials Summary [2.]	Direction and Distance from the Project Corridor
All American Graphics (LUST)	6317 W. Greenfield Avenue	Gasoline – Unleaded and Leaded	Closed	No	North, 350 Feet
Thelens Service Station (LUST)	2101 Douglas Avenue	Gasoline – Unleaded and Leaded	Closed	No	North, 350 Feet
Viking Communications Inc. (LUST)	1421 S. 62nd Street	Gasoline – Unleaded and Leaded, Diesel Fuel - Off-Site	Closed	Yes	Adjacent, South Side
Purtock Robert Property (LUST)	1430 S. 62nd Street	Petroleum - Unknown	Closed	No	Adjacent South Side
Walgreens #10963 (LUST)	6101 W. Greenfield Avenue	Diesel Fuel	Closed	No	East, 250 Feet
Pressed Steel Co (LUST)	1452 S. 66th Street	Gasoline – Unleaded and Leaded, Arsenic, Chromium, Lead, VOC's, PAH's	Closed	No	Adjacent, West End
Pressed Steel Tank Co Inc. (former) (LUST)	1445 S. 66th Street	Gasoline – Unleaded and Leaded	Open	No	Adjacent, West End

[1.] Closed means that the site required no further action at the time the site was closed by the WDNR but could require further action if conditions on the site change in the future.

[2.] Sites listed on the Hazardous Materials Summary Table in Appendix B could affect the project corridor.

Four of the sites listed above are adjacent to the project corridor. Six of the seven sites are closed. The three sites not adjacent to the project corridor are excluded due to the distance of 250 feet or further from the project corridor.

Sites not listed on the Hazardous Materials Table were excluded from further consideration based on WDNR file review, type of incident and site status, or distance off the project corridor.

4.1.3 Underground Storage Tanks UST Sites

Wisconsin and/or Tribal Registered Storage Tanks (RST / UST) Facility List

The RST / UST facility list is an inventory of registered liquid bulk storage tanks. Inclusion of a site on the RST / UST list does not necessarily constitute environmental contamination, but instead merely indicates the presence of registered bulk storage tanks.

Site Name	Address	Tank Status	Listed on Table 1 Appendix B Hazardous Materials Summary [1. 2.]	Direction and Distance from the Project Corridor
Motor Castings Rental Property	6325 W. National Avenue	3 Tanks Closed / Removed	No	South, On-Corridor
George Johnson	6428 W. National Avenue	1 Tank In-Use	No	North, On-Corridor
Larry Buzzell	6428 W. National Avenue	1 Tank Closed / Removed	No	North, 350 Feet
City of West Allis right-of-way	S. 65th Street and W. National Avenue	1 Tank Closed / Removed	No	West, Off- Corridor
Pressed Steel Tank Company	1445 S. 66th Street	1 Tank Closed / Removed	No	West, Off-Corridor
Pressed Steel Tank Company	1445 S. 66th Street	2 Tanks Closed / Removed, 1 Tank Closed In-Place	No	West, Off- Corridor
Six Points Farmers Market Project	6633 / 6639 W. National Avenue	3 Tanks Closed / Removed	No	West, 500 Feet
Salvage Heaven	6633 / 6639 W. National Avenue	1 Tank Closed / Removed	No	West, 500 Feet
All American Graphics	6317 W. Greenfield Avenue	8 Tanks Closed / Removed, 1 Tank Closed / Filled	No	North, 350 Feet
Thelens Service Station	6427 W. Greenfield Avenue	6 Tanks Closed / Removed	No	North, 350 Feet
Thompson Bakery	6207 W. Greenfield Avenue	1 Tank Closed / Filled	No	South, On-Corridor
Mary Jane St Clair	1532 S. 64th Street	1 Tanks Closed / Removed	No	South, 250 Feet

Viking Land Mobil Communications Inc.	1421 S. 62nd Street	2 Tanks Closed / Removed	Yes	South, On Corridor

1. Closed means that the site required no further action at the time the site was closed by the WDNR but could require further action if conditions on the site change in the future.

2. Sites listed on the Hazardous Materials Summary Table in Appendix B could affect the project corridor.

Sites not listed on the Hazardous Materials Table were excluded from further consideration based on WDNR file review, type of incident and site status, or distance off the project corridor.

4.1.4 RCRA-VSQG

RCRA generator sites include generators of hazardous waste regulated under RCRA. Under RCRA, hazardous waste generators are classified by the quantity of hazardous waste generated in a calendar month into the following categories: Large Quantity Generator (LQG), greater than 1,000 kilograms (kg); Small Quantity Generator (SQG), 100 to 1,000 kg; and Conditionally-Exempt Small Quantity Generator (CESQG), less than 100 kg, and Very Small Quantity Generators (VSQG) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. RCRA Generators, while they represent some form of hazardous waste activity, are most significant if they are determined to have Class I Violations or to be non-compliant.

Analysis: There are two RCRA Very Small Quantity Generators (RCRA-VSQG), within 1/8 – 1/4 mile of the project corridor.

One of the RCRA-VSQG sites was listed with no violations. The second listing, Westway Auto Body Inc. located at 1402 S. 62nd Street, had a compliance evaluation inspection on-site with written informal violation of Generators – Pre-Transport in 2010. The site was brought back into compliance and has no violations since then.

4.1.5 RCRA-NonGen

The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Three of the RCRA NonGen sites were listed with no violations.

The Pressed Steel Tank Company located at 1445 S. 64th Street had violations:

- A general compliance evaluation inspection on-site with a Written Informal notice in October of 1993 for Generators - General.
- A general compliance evaluation inspection on-site with a Written Informal notice in October of 1996 for Generators - General.
- A general compliance evaluation inspection on-site with a Written Informal notice in October of 2003 for Generators - General.

The site was brought back into compliance after each violation, and has no violations listed since 2005.

4.1.6 FINDS

The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

Analysis: EDR identified five FINDS sites within the specified search radius of 1/8 mile of the project corridor. Castech located at 6325 W. National Avenue (UST site), All American Graphics located at 6317 W. Greenfield Avenue (LUST site), Thelens Service Station located at 6427 W. Greenfield Avenue (LUST site), Westway Auto Body Inc. located at 1412 S. 62nd Street (Manifests site), and 700 Properties located at 6500 W. National Avenue (US Brownfields). All of the sites were previously covered in the report.

4.1.7 WI MANIFEST

These sites are required to use manifests to track their shipping and disposal of hazardous waste. This database is only used to track hazardous waste and does not mean there have been spill or releases at the site.

Analysis: There are five Wisconsin MANIFESTS sites within 1/8 mile of the project corridor. Westway Auto Body Inc., located at 1402 S. 62nd Street, had a violation in 2010 and was brought back into compliance. The Pressed Steel Tank Company, located at 1445 S. 64th Street, had violations in 1996, 2003, and 2005 and was brought back into compliance. The three remaining sites did not have any violations listed.

4.1.8 WI ERP

WI Emergency Repair Program (ERP) database includes non-LUST sites with contaminated soil and/or groundwater. Often these are historical releases to the environment.

Analysis: Six WI ERP sites were located within 1/8 mile of the project corridor:

- Property No 113 located at 1441 S. 65th Street was opened in 2005 under WDNR jurisdiction with soil and groundwater contaminated with arsenic, chromium, lead, gasoline – unleaded and leaded, Polynuclear Aromatic Hydrocarbons, and Volatile Organic Compounds. The site was closed by WDNR in 2010. There is some low-level residual soil contamination on the northwest corner of 65th and W. National Avenue that could extend into the right-of-way and affect the project corridor. (Special Provisions)
- Pressed Steel Company located at 1452 S. 66th Street was opened in 2005 under WDNR jurisdiction with soil and groundwater contaminated with arsenic, chromium, lead, gasoline – unleaded and leaded, Polynuclear Aromatic Hydrocarbons, and Volatile Organic Compounds. The site was closed by WDNR in 2010. The site is located adjacent to the west end of the corridor and could affect the project corridor. No WDNR file was available for this area of site. (Special Provisions).
- Pressed Steel Tank Company located at 1445 S. 66th Street was opened in 2002 under WDNR jurisdiction with soil and groundwater contaminated with acid, Polynuclear Aromatic Hydrocarbons, and Chlorinated Solvents. The site is listed as open. The site is located 330 feet to the west end of the corridor and should not affect the project corridor. (Special Provisions)
- Thelens Service Station located at 6427 W. Greenfield Avenue was opened in 1980 under WDNR jurisdiction with soil contaminated with gasoline – unleaded and leaded. The site was closed by the WDNR in 1996 with a deed restriction for residual soil contamination.

The site is located approximately 300 feet to the north of the project corridor and should not affect the project.

- COD Plumbing Supply Inc. is located at 6203 W. National Avenue was opened under WDNR Jurisdiction in 1997 with soil contaminated with diesel fuel, and gasoline – unleaded and leaded. The site is listed as an open site. The site is located adjacent to the project corridor on the south side and could affect the project corridor. (borings)
- Wells Fargo Bank located at 6130 W. National Avenue was opened in 1996 under WDNR jurisdiction with soil and groundwater contaminated with mineral oil. The site was closed by WDNR in 2009. The site is located approximately 250 feet northeast of the project corridor and should not affect the project.

4.1.9 WI AUL

WI AUL indicates a deed restriction is recorded at the Register of Deeds office for a property. Extent of soil contamination is known but impracticable to remove now or engineering control is required to be maintained or NR720 industrial standards are applied and restricts property use or requires future action.

Analysis: There are the three WI AUL sites with 1/4 mile of the project corridor.

- Pressed Steel Company located at 1452 S. 65th Street was opened in 2005 under WDNR jurisdiction with soil and groundwater contaminated with arsenic, chromium, lead, gasoline – unleaded and leaded, Polynuclear Aromatic Hydrocarbons, and Volatile Organic Compounds. The site was closed by WDNR in 2010. The site is located adjacent to the west end of the corridor and could affect the project corridor. (Special Provisions)
- Pressed Steel Tank Company located at 1445 S. 65th Street was opened in 2002 under WDNR jurisdiction with soil and groundwater contaminated with acid, Polynuclear Aromatic Hydrocarbons, and Chlorinated Solvents. The site is listed as open. The site is located adjacent to the west end of the corridor and could affect the project corridor. (Special Provisions)
- Viking Communications Inc. located at 1421 S 62nd Street was opened under WDNR Jurisdiction in 1996 with soil contaminated with gasoline – unleaded and leaded, and diesel fuel. The site was closed in 2009 by the Department of Commerce. The site was closed with groundwater contamination below the PAL groundwater standards, and residual soil contamination above the residual contamination level (RCL). The was also a note about

off-site concerns. The site is located on the south side of the project corridor and could affect it. (borings)

4.1.10 State and Tribal Voluntary Cleanup Sites (VCP)

The Voluntary Party Liability Exemption is an elective environmental cleanup program. Interested persons who meet the definition of "voluntary party" are eligible to apply. A voluntary party is any person who submits an application and pays all the necessary fees.

Analysis: The EDR report listed one VCP site within 1/8 mile of the project corridor, Pressed Steel Tank Company located at 1445 S. 66th Street. The site is listed above as a WI ERP, LUST, and an AUL site.

4.1.11 Brownfield Sites

Brownfields are abandoned, idle or under used commercial or industrial properties, where the expansion or redevelopment is hindered by real or perceived contamination.

Analysis: Three US Brownfield sites were located within 1/8 mile along or adjacent to the project corridor:

- West Allis Six Points / Farmers Market located at 6501-6533 W. Greenfield Avenue is listed as a Brownfield site. The site received a site assessment grant (SAG) in 2002 related to contamination, demolition, tank/container removal or other actions. The site is also listed as a UST site listed above. The site is located adjacent to the west end of the project corridor and could affect it. But the intersection at S. 65th Street and W. National Avenue was reconstructed as part of another project, so this should not affect the project corridor.
- Credit Union Former located at 6512 W. Greenfield Avenue is listed as a Brownfield site. The site was given a general liability clarification letter from the WDNR after a fee was paid. Potential contamination which was later found to be non-existent or below reportable quantity. The site is located 400 feet to the north of the project corridor and should not affect it.
- Pressed Steel Tank Company located at 1445 S. 66th Street is listed as a Brownfield site. The site is listed above as a WI ERP, LUST, and an AUL site.

4.1.12 Local Brownfield Sites

Local Brownfield properties come from a list from the Cleanups in my Community Program. Brownfields are abandoned, idle or under used commercial or industrial properties, where the expansion or redevelopment is hindered by real or perceived contamination.

Analysis: Two local Brownfield sites were located within 1/8 mile along or adjacent to the project corridor:

- A site referred to “700 Properties” as specified in the EPA database, including the site located at 6500 W. National Avenue, is listed as a local brownfield site, historically the site consisted of a former cement contractor, salvage yard, industrial building, and two commercial taverns. In 2008, the City of West Allis received a grant for hazardous cleanup planning. The site is listed as four acres. The site is located adjacent to the west end of the project corridor and could affect it. But the intersection at S. 65th Street and W. National Avenue was reconstructed as part of another project, so this should not affect the project corridor.
- Pressed Steel Tank – North located at 6601 – 6609 W. Greenfield Avenue is listed as a local brownfield site, historically the site consisted of industrial use for 1906 until 2006. The site was used for various manufacturing processes for a wide range of products. In 2008, the City of West Allis received a grant for hazardous cleanup planning. The site is listed as four acres. The site is located more than 550 feet to the northwest and should not affect the project corridor.

4.1.13 SHWIMS

Solid Hazardous Waste Information Management System (SHWIMS) lists sites and facilities operating at sites, that are regulated by the Waste Management Program. Other databases would indicate if there were spills or releases at the sites. There are thirteen sites located within 1/8 mile of the project corridor that are regulated under this program.

Analysis: Nine sites are listed as operating, one is listed as unknown, one is listed as closed, and two are listed as moved.

4.1.14 EDR Historical Auto Lists

EDR Historical Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns but may not show up in current government records searches.

Analysis: EDR identified one EDR Historical Auto site within the specified search radius of 1/8 mile of the project corridor. 6427 W. Greenfield Avenue is listed as Thelens Joseph P Jr gasoline / service station from 1969 to 1990 and is located 300 feet north of the project corridor and should not affect it.

4.1.15 Orphan Sites

The EDR report included a list of properties that could not be mapped due to inadequate address information. Sites on the list were not observed in the vicinity of the Project Site and could not be located with the information provided in the EDR report. GRAEF attempted to locate these sites using maps and area reconnaissance, and the sites that could be located are included in the appropriate database section of this report.

4.2 Sanborn Maps

Sanborn Maps were available for the project corridor. A copy of the report is in Appendix E.

Property Name/ Address	Map Year	Direction	Shown on San Born Maps as	Table 1 Appendix B
6427 W. Greenfield Avenue	1966, 1950, 1927	300+ Feet North of Corridor	Filling Station, Gasoline Tanks	No
6317 / 6309 W. Greenfield Avenue	1966, 1950, 1927	100 Feet North, of Corridor	Automotive Service Station	No
6323 W. National Avenue	1966, 1950	South, On Corridor	Automotive Service Station	No
5405 W. Greenfield Avenue	1927	150 Feet North, of Corridor	Filling Station	No

5301 / 6201 W. National Avenue	1927	South on Corridor	Filling Station, Gasoline Tanks	Yes
5225 W. National Avenue	1927	75 Feet East of Corridor	Gasoline Tanks	No

Based on the distance of these sites from the project corridor, WDNR files were requested and reviewed, if available. No WDNR files were available for the site at 6201 W. National Avenue, or 6323 W. National Avenue.

5301 / 6201 W. National Avenue was a gas station with gasoline tanks on the 1927 Sanborn map. Contamination could be present at the site that could extend into the W. National Avenue right of way and could affect the project corridor. (borings)

6323 W. National Avenue is shown as an auto service facility on the 1950 and 1966 Sanborn maps. There is a potential contamination could be present at the site. (special previsions)

4.3 Aerial Photographs

Aerial photographs were obtained from Environmental Data Resources, Inc. (EDR) for the years 1937, 1950, 1955, 1963, 1969, 1979, 1981, 1986, 1992, 2000, 2005, 2010, 2013, and 2017. These photographs were visually reviewed for changes on the project corridor. The Aerial Photos are in Appendix F.

During the period covered by aerial photography, conditions on the project corridor have not changed through the 2005 aerial photograph. In 2005 areas were cleared for redevelopment on the west end north side and new apartments were constructed. The project corridor remains unchanged after that.

Year	Project Corridor	Adjacent and Surrounding Properties
1937	The project corridor is a mix of mainly residential, commercial and limited industrial properties. There was a railroad lines running west of the project corridor running north to south. S. 65th Street is on the west end of the corridor, and S. 62nd Street is on the east end of the corridor. S. 64th and S. 63rd Street runs through the center of the project corridor.	The area is a mix of mainly residential properties, commercial properties, and limited industrial properties, churches, schools, banks, gas stations, restaurants, and parks are in the area.

1950	The project corridor looks the same.	The surrounding area looks the same.
1955	The project corridor looks the same.	The surrounding area looks the same.
1963	The project corridor looks the same on the eastern half of the visible photo.	The surrounding area looks the same on the eastern half of the visible photo.
1969	The project corridor looks the same.	The surrounding area looks the same.
1979	The project corridor looks the same.	There have been some new commercial / industrial buildings built west of the project corridor.
1981	The project corridor looks the same.	The surrounding area looks the same.
1986	The project corridor looks the same.	There is an area to the west of the project corridor that was cleared for redevelopment.
1992	The project corridor looks the same	There is an area to the north and west of the project corridor that was cleared for redevelopment. There are some new commercial buildings north and west of the project corridor.
2000	No significant changes observed on the project corridor.	There are some new industrial buildings north of the project corridor
2000	No significant changes observed on the project corridor.	The surrounding area looks the same.
2005	There are new apartment buildings north of the project corridor on the west end.	There is an area to the west of the project corridor that was cleared for redevelopment.
2010	No significant changes observed on the project corridor.	No significant changes observed adjacent to or around the project corridor.
2013	No significant changes observed on the project corridor.	No significant changes observed adjacent to or around the project corridor.
2017	No significant changes observed on the project corridor.	No significant changes observed adjacent to or around the project corridor.

4.4 Building Permit Records

Building permit files for the project corridor were not reviewed due to the extent of development along the corridor, and the minimal value they would provide to the Phase I Assessment.

The City of West Allis Zoning Map was reviewed along the project corridor and the surround area. This identified corridor currently includes zoning for C-3 Community Commercial District, C-2 Neighborhood Commercial District, RB-2 Residential District, PDD-1 Planned Development Residential, PDD-2 Planned Development Commercial, and P-1 Park District.

4.5 Interviews

GRAEF contacted the Department of Development and Planning, the Engineering Department, the Building Inspections Department, and the West Allis Fire Department for any sites with environmental concerns for W. National Avenue from S. 65th Street east to S. 62nd Street.

GRAEF contacted Patrick Schloss, the City of West Allis manager of the Department of City Development. He has not returned a call as of the time of the report preparation.

GRAEF contacted the Department of Neighborhood Services / Inspection Department. They do not keep records of contaminated sites in the Building Inspection Department. He said to speak with the City Development Department. No additional information was available.

GRAEF contacted Traci Gengler P.E., Principal Engineer, with the City Engineering Department. She was not aware of any additional environmental site along the project corridor then the ones GRAEF already identified.

A phone conversation was conducted with Lieutenant Dumbrowski of the West Allis Fire Department on doing a records review for the project corridor. He said that there were multiple properties – commercial, industrial, and residential that would need to be checked on the project corridor, and this could easily cost up to $1,000 to review all the records available. Given the cost of the records search by the fire department, and that much of the same information would duplicate the DATCP database, a record search was not requested from the fire department.

4.6 Department of Natural Resources Database review

The WDNR BRRTS on the web database and RR site maps were reviewed for sites with contamination along or adjacent to the project corridor. No additional sites were found along or adjacent to the project corridor that were not listed on the EDR report. See Appendix C.

4.7 Department of Natural Resources File Review

Seven files were requested for review from the WDNR office. See Appendix B for the WDNR e-mail requesting files for review and the files reviewed that could affect the project corridor. No WDNR files were available for site 2. See Appendix D for files reviewed that were determined as unlikely to affect the project corridor. A summary is listed below;

- COD Plumbing Supply Located at 6203 W. National Avenue is listed as an open ERP site with soil and groundwater contaminated with gasoline – unleaded and leaded, and diesel fuel. The site owner would not allow the neighboring property owner (Viking Land Mobil Communications) to investigate possible soil and groundwater contamination extending on to their site. The property owner and the WDNR have been going back and forth about who is responsible for the site investigation. The site owner denied access to the property to Viking Land Mobil Communications consultant to determine if the contamination came from there tank. The responsibility for the investigation than became their problem according to the WDNR. The owner claimed they did not have the financial resources to pay for that investigation. In 2014 the WDNR sent a letter for final case closure with continuing conditions. But the site is still listed as open. The site has soil and groundwater contamination that could potentially extend into the right-of-way and affect the project corridor.

- Robert Putlock Property located at 1430 S. 62nd Street is a closed LUST site with soil contaminated with fuel oil. One 1,000-gallon UST was removed from the property on October 23, 1992, by R-K Tank Removal. Giles Engineering Associates Inc. performed a tank closure assessment. A small amount of contaminated soil was removed from the area where there was a small hole in the south end of the tank. Then six soil samples were collected from the tank excavation, two from the bottom and four from the side walls. All the samples were field screened with a PID and were no detect. The two bottom samples and the pea gravel sample from inside the tank were submitted for lab analysis. The bottom samples were below detection limits, the pea gravel was at 2,500 ppm. The WDNR required Giles Engineering Associates to collect another lab sample from the bottom of the tank excavation (13-15 feet bgs) for independent lab analysis by EnChem Inc, of Green Bay, WI. The sample had a DRO level of 7.2 ppm, below the WDNR interim soil closure guidelines of 250 ppm. The site was closed by the WDNR in August of 1994 and should not affect the project corridor.

- Viking Land Mobil Communications Inc. located at 1421 S. 62nd Street is a closed LUST site with soil contaminated with gasoline – leaded and unleaded, and diesel fuel. On December 12, 1996, a 550-gallon leaded gasoline UST and a 5,000-gallon fuel oil UST was removed. Soil and groundwater contamination was encountered. A site investigation work plan was

submitted to the WDNR in February 23, 1997. Five soil borings were done as part of the site investigation and were sampled for GRO, DRO and PVOCs, and three samples had contamination levels above the Residual Contamination Level (RCL) for GRO, DRO, and Benzene. In April 2001 the Wisconsin Department of Commerce closed the site with residual soil and groundwater contamination. There was low level contamination that could extend into the right-of-way, located 70 feet southeast of the project corridor and could affect it.

- Pressed Steel Tank Property No. 102 located at 1452 south 66th Street (BRRTS 02-41-543660) and Pressed Steel Property No. 113 located at 1441 S. 65th Street (BRRTS 02-41-543659) are combine into one file by the WDNR. Pressed Steel Property No. 102 is a closed ERP site with soil and groundwater contaminated with gasoline – unleaded and leaded, PAHs, VOC's, lead, chromium, and arsenic that was opened in 2005 under WDNR jurisdiction. Pressed Steel Property No. 113 is a closed ERP site with soil and groundwater contaminated with gasoline – unleaded and leaded, PAHs, VOC's, lead, chromium, and arsenic, and was opened in 2005 under WDNR jurisdiction. Soil and groundwater investigation activities were conducted at the sites between 1999 and 2006. The soil investigation included the advancement of 44 soil borings. Soil samples were collected and submitted for analysis for PVOCs, VOCs, DRO, GRO, PAHs, and PCBs. Nine groundwater monitoring wells were also installed. Soil was excavated for a basement parking structures, soil that had low level PAH contamination that could not be reused on site was disposed of at The Jays Fuel Oil Site (BRRTS # 02-41-184802) with WDNR approval letter dated 4/18/2006. Approximately 9130 cubic yards of soil was moved to that site. Another approximately 130 cubic yards of non-hazardous material was landfilled at Viola Emerald Park landfill in Muskego. Approximately 32 tons of soil impacted with DRO remain in the area. The site was closed by the WDNR in 2010 with residual contamination remaining on site. There is some remaining low-level residual contamination in the area of the former AGMW-3 on the northwest corner of 65th and W. National that could extend into the right-of-way and could affect the project corridor.

- Pressed Steel Tank Company located at 1452 S. 66th Street (BRRTS # 03-41-000161) is listed as a closed LUST Site with gasoline – unleaded and leaded contamination. GRAEF contacted the WDNR for a file review for this site, Theadora Jorgenson said the file was

declared missing in 2018 and cannot be reviewed. This is part of the same property listed above, just a different incident.

- Pressed Steel Company located at 1445 S. 66th Street is listed as a closed LUST Site with soil and groundwater contaminated with gasoline – unleaded and leaded. In September 1989, a 1,000-gallllon gasoline UST, dispenser and associated piping was removed from the southeast corner of the property near 66th Street and National Avenue. The tank was pitted and in poor condition, and a gasoline odor was present while exposing the tank. Contaminated backfill was excavated and staged on plastic. Laboratory samples were collected for three of the side walls and base of the excavation. The lab results ranged from 24 ppm as TPH to 4440 ppm TPH. In November 1989, a 1,000-gallon gasoline UST and associated piping were removed from a tank excavation located off the northwest corner of building NO. B. The tank was in poor condition with pitting and holes in the steel shell. The contaminated soil backfill was removed and staged on plastic and covered with plastic. Laboratory sample samples were run for TPH and were no detect, but the soil sample from the staged soil pile had low level PVOCs. Several investigations were done to define the extent of soil and groundwater in the areas. Work plans were submitted to the WDNR for review and approval. A soil and groundwater pump and treat system and a soil vapor extraction system were installed and run at the site. In September 1999 a request was put in to the WDSNR to close the site. The site was closed in 2003 with residual soil and groundwater contamination remaining. Soil and groundwater contamination may extend into the right-of-way, but the site is located more than a block west of the project corridor and should not affect it.

4.8 Department of Agriculture, Trade, and Consumer Protection

Department of Agriculture, Trade, and Consumer Protection (DATCP) underground storage tank (UST) and above ground storage tank (AST) registration records (including fuel oil) were reviewed via an Internet connection to their Storage Tank database on February 12, 2020. The search criteria included West National Avenue, West Lapham Street, West Greenfield Avenue, West Madison Street, South 67th Street, South 66th Street, South 65th Street, South 64th Street, South 63rd Street, South 62nd Street, South 61st Street, South 60th Street. No additional records were found in the vicinity of the project corridor.

4.9 Private Supply Well Data

The City of West Allis is supplied with drinking water from the City of Milwaukee water utility. No private supply wells were visible from the right-of-way along the project corridor.

4.10 Site Utilities

Utilities located along the project corridor included underground fiber-optic and buried cable, underground street lighting and traffic signal control conduits, underground water and sewer owned by the City of West Allis; and underground natural gas and underground and overhead electric owned by We Energies.

4.11 Site Reconnaissance

Edward Diesch from GRAEF conducted a site reconnaissance on February 11, 2020. Weather conditions at the time of the walk-through were sunny with an average temperature of 26 degrees. Selected photographs from the site reconnaissance are available in Appendix F.

W. National Avenue is a two-lane roadway with parking lanes on both sides of the street. The roadway pavement generally consists of a concrete base with an asphalt overlay. Concrete sidewalk is present on the north and south sides of the roadway.

Properties located adjacent to the W. National Avenue corridor on the south side of the road starting at the west end included: S. 65th Street, residential, private asphalt parking lot, S. 64th Street, Former Caltech Incorporated – vacant (parking lots on the east and west sides of the building), Z'S Bar and residential, S. 63rd Street, McGuire's Irish Pub / Wisconsin Restaurant Supply, commercial / residential – vacant, Powerful Nutrition and Fitness, parking lot, Antigua – Restaurant, Bathroom Center Store – storage, S. 62nd Street.

Properties located adjacent to the W. National Avenue Corridor on the north side of the road starting at the east end included: S. 62nd Street, Epikos Church, S. 63rd Street, MHVI Building, parking lot, four houses, S. 64th Street, Persona Bar, two houses, commercial property – vacant, residential, commercial – oniomania store, S. 65th Street.

A fill pipe and vent lines were observed at 6207 W. National Avenue (south side of road). The tank appears to be currently in-use, and no visible staining was observed on the concrete by the pipes. A waste oil container was in the front yard of the house at 6406 W. National Avenue (north side of the road) with no visible staining.

No fill pipes or vent lines for tanks were visible from the right-of-way on the remaining properties along the project corridor. GRAEF observed no distressed vegetation, or other signs of significant environmental concern on the properties along the project corridor from the right-of-way. Areas of the project corridor were snow covered so staining or distressed vegetation or depressions in the site could not be observed in all areas.

5 CONCLUSIONS AND RECOMMENDATIONS

The following sites have the potential to affect the environmental conditions within the project corridor. The conclusions and recommendations concerning these sites are summarized below:

Site Address: COD Plumbing Supply Inc Site at 6203 W. National Ave. (Site 1)
Station: 14+20 to 14+70

Incident Type: ERP Site

Site status: Open

Acquisition Requirements: TLE for grading and sidewalk placement

Excavation Requirements: Approximately 3 feet for the road and up to 10-12 feet for storm sewer, sanitary sewer and water main improvements.

Contaminants of Concern: Potential soil and groundwater contaminated with gasoline – unleaded and leaded.

Tank Status: Unknown when the tanks were removed

Site Summary and recommendations: Based on Sanborn maps from 1927 gasoline underground storage tanks and a gas station were present on site. Potential soil contamination may be present in the right-of-way on W. National Avenue. Soil borings were previously performed adjacent to the south side of the property and gasoline and diesel contamination was encountered. A Phase 2.0 site investigation is recommended. A Hazardous Materials Summary Form is included in Appendix B1.

Site Address: Viking Land Mobil Communications Inc. at 1421 S. 62nd Street (Site 2)
Station: 13+50 to 14+20

Incident Type: Closed LUST

Site status: Closed

Acquisition Requirements: None

Excavation Requirements: Approximately 3 feet for the road and up to 10-12 feet for storm sewer, sanitary sewer and water main improvements approximately 70' north of site.

Contaminants of Concern: Potential Soil and groundwater contaminated with gasoline – unleaded and leaded, and diesel fuel.

Tank Status: Unknown

Site Summary and recommendations: On December 12, 1996, a 550-gallon leaded gasoline UST and a 5,000-gallon fuel oil UST was removed. Soil and groundwater contamination was encountered. Five soil borings were done as part of the site investigation and were sampled for GRO, DRO and PVOCs. Soil Samples from VC-1, VC-2, and VC-4 had contamination levels above the Residual Contamination Level (RCL) for GRO, DRO, and Benzene. In April 2001 the Wisconsin Department of Commerce closed the site with residual soil and groundwater contamination. There was low level contamination that could extend into the right-of-way, located 70 feet south of the project corridor and could affect it. A Phase 2.0 site investigation is recommended. A Hazardous Materials Summary Form is included in Appendix B1.

It is recommended that consultants and contractors performing the Phase 2 investigations refer to WDNR draft guidance RR-999. Site #1 had gasoline tanks, lab analysis would be for VOCs and lead. Site #2 had gas and fuel oil tanks, lab analysis would be for GRO, DRO, PVOCS, and lead.

The Three Pressed Steel Tank Site are closed with potential residual contamination in the right-of-way – 1441 S. 65th Street, and 1452 S. 66th Street with two separate occurrences. The intersection

of S, 65th Street and W. National Avenue was previously reconstructed during a different project. Standard Special Provisions apply. If contamination is encountered during work in these area notify the engineer.

6 LIMITATIONS

GRAEF has performed this Phase 1 Hazardous Materials Assessment for the project corridor described in Section 1.0 of this report. The Phase I Hazardous Materials Assessment was conducted using the degree of care and skill ordinarily exercised under similar circumstances by environmental consultants practicing in this or other localities. The information in this report is deemed reliable but cannot be a guarantee, warranty, or certification that all hazardous or potentially hazardous substances conditions have been located or identified.

#1 Sites for which soil borings, or special provisions are recommended, or sites for which soil brings or special provisions May be recommended, if the scope of work changes.
#2 Additional details on these sites, and other sites that were reviewed within proximity to the Project Corridor are detailed in the text.

WisDOT Phase 1 Hazardous Materials Assessment Site Summary
(rev. 2/2016)

Instructions: following FDM 21-35-5, perform site assessment, fill in information for each site investigated. Multiple sites with no identified environmental concerns may be summarized on one form.

Recommendation acceptance/rejection/modification should be completed and signed by the person with the authority to make project decisions (for example: region hazardous materials coordinator, project manager, local road management consultant)

WisDOT Project ID: Project ID 2410-13-70
Highway/Street: West National Avenue
Termini/Limits: West 65th Street to West 62nd Street
County or Counties: Milwaukee

Property Information:
Site Name(s): COD Plumbing Supply Inc.
DOT parcel number (if known):
Property Address: 6203 West National Avenue, West Allis, WI. 53214
Owner's Name: Richard Libbey
Owner's Address: 6203 West National Avenue, West Allis, WI. 53214
Owner's Phone: phone number, including area code
Current Land Use: Commericla building
Past Land Use: Former Gas Station

Real Estate Requirements:
☐None ☐Total take ☐Strip acquisition of feet
☒Temporary Limited Easement (TLE)
☐Permanent Limited Easement (PLE)
☐ Other (describe)

Construction Requirements:
☒ Excavation within current right of way to a depth of 5-12 feet
☐ Excavation within proposed right of way to a depth of feet
☐ Excavation within easement to a depth of feet
☒ Public or private utility or sanitary or storm sewer installation or excavation to a depth of 5-12 feet

☐ Contamination discovered at feet during utility or other excavation in the area. Indicate location on site map.
Interview Information or other comments:

Visual Evidence of Potential Contamination: (include additional information in space provided)
☐ No evidence of tanks
☐ USTs ☐ASTs Location, number and condition of tanks, contents, comments:
Location in relationship to current right of way: ☐ map attached
Location in relationship to proposed right of way: ☐ map attached
☐ Drums ☐Stained soils ☐Odor ☐Sheen on surface water ☐Areas of excavation ☐ Areas of fill
☐Stressed vegetation ☐ Pond(s) ☐ Basins/sumps ☐ Monitoring wells ☐ Soil borings
Comments:

Potential for Contaminant Migration: (attach supporting documentation such as plume maps, summaries of site investigation or closure reports).
☒ Property is a potential source of contamination
☐ Adjacent property is a potential source of contamination. Include site name and address or BRRTS number if known, describe location, and include contaminant type and any additional information.
☐ Contaminated soil within proposed right of way from feet to feet below ground surface
☐ Contaminated groundwater within proposed right of way at feet below ground surface.
☐ Contaminated soil or groundwater within existing right of way. Attach copy of most recent investigation and plume maps or DNR form 4400-286 and plume maps.

Attachments – required
☐ Site photographs and a site map showing areas of concern
☐ Plat map showing parcel and any proposed areas of acquisition or easement
☐ Historic aerial photos of site - clearly outline site
☐ Historic WisDOT or other as-builts and plat maps - clearly outline site
☒ Plume maps for known contamination. Indicate existing or proposed right of way on plume maps where applicable.
☐ Closure letter with continuing obligations for sites closed with continuing obligations

Recommendations
☐ No additional hazardous materials investigation is required.
☐ If construction or real estate requirements change, evaluation of need for further investigation will be necessary.
☐ Information is sufficient to use Standard Special Provisions. Copy of completed Standard Special Provision is attached.
☒ Conduct additional investigation
- ☒ Phase 2 (determine if contamination is present)
- ☐ Phase 2.5 (determine extent of contamination within existing R/W only)
- ☐ Phase 3 (determine full extent of contamination prior to acquisition)
- ☐ Phase 4 (remediate site)
- ☐ Other (describe)

☐ Site has continuing obligations. Coordination with DNR will be required.

Mr. Richard Libbey
6070 Shady Lane
Hartford, WI 53027

SUBJECT: Reported Contamination at 6203 W. Greenfield Avenue, West Allis

To speed processing, correspondence should reference BRRTS & FID numbers at top of letter.

Dear Mr. Libbey:

On May 1, 1997, the Wisconsin Department of Natural Resources requested your cooperation in investigating the possible migration of petroleum contamination from land owned by Viking Land Mobile Communications (VIKING) to your property. The letter referred specifically to concerns about soils and groundwater contamination affecting the parking lot north of the VIKING building. A lab analysis of soil and groundwater samples collected on the southern half of the parking lot had indicated that petroleum contamination may have migrated onto the northern half. City of West Allis records indicate that the northern half of the parking lot is owned by you and Mrs. Eva Libbey.

On October 2, 1997, the Department sent you a second letter, advising you that, to our knowledge, you had not cooperated with representatives of VIKING and their environmental consultant, S.A.G. Environmental, Inc. (SAG), to permit investigative activities on your property. You were invited to set up a meeting with David Dahms, an environmental enforcement specialist with the Department, and myself, during the week of October 13, to discuss this issue. You were advised that failure to schedule and/or attend the meeting would result in a determination that you were asserting possessor control of the potential discharge of hazardous materials. In a message left on my voice mail on Saturday, October 11, you suggested I do a real time premises verification at the site, using a map which you would send by registered mail. The map you sent indicated that the address which we had been provided for your property, 6135 W. Greenfield, was actually located across the street from the parking lot in question. At the bottom of the map, you wrote that you were available for a meeting, pending my analysis of the map, but that you did not believe it was required.

We appreciate your assistance in correcting the site address, and our records have been updated. At the same time, we believe that the description of the property in question, given in the May 1 letter, was sufficient to identify its location. Because you have failed to respond to requests from SAG to allow access to the parking lot, and because you did not schedule a meeting with Dave Dahms and myself, the Department has concluded that you have asserted possession of the potential discharge of hazardous substances located on your property and are responsible for restoring the environment at the referenced site under Section 292, Wisconsin Stats., known as the hazardous substances spills law.

This case has been assigned an unknown ranking due to the lack of information concerning soil and groundwater contamination.

WDNR Southeast Region Prioritization and Scoring Policy

Due to the WDNR workload, it is necessary to rank all contamination cases for review priority. Lower priority cases do not have assigned project managers, however, responsible parties are required to proceed with investigation and clean-up efforts. Until a priority has been assigned to this site, you should proceed with the required response work, submitting all plans and reports, along with status reports, to this office. The WDNR will notify you if your site will receive active oversight.

Your responsibilities include investigating the extent of the contamination and then selecting and implementing the most appropriate remedial action. Enclosed is information to help you understand what you need to do to ensure your compliance with the spills law.

The purpose of this letter is threefold: 1) to describe your legal responsibilities, 2) to explain what you need to do to investigate and clean up the contamination, and 3) to provide you with information about cleanups, environmental consultants, possible financial assistance, and working cooperatively with the Department of Natural Resources.

Legal Responsibilities:
Your legal responsibilities are defined both in statute and in administrative codes. The hazardous substances spill law, Section 292.11 (3) Wisconsin Statutes, states:

* RESPONSIBILITY. A person who possesses or controls a hazardous substance which is discharged or who causes the discharge of a hazardous substance shall take the actions necessary to restore the environment to the extent practicable and minimize the harmful effects from the discharge to the air, lands, or waters of the state.

Wisconsin Administrative Codes chapters NR 700 through NR 728 establish requirements for emergency and interim actions, public information, site investigations, design and operation of remedial action systems, and case closure. Chapter NR 708 includes provisions for immediate actions in response to limited contamination. Wisconsin Administrative Code chapter NR 140 establishes groundwater standards for contaminants that reach groundwater.

Steps to Take:
The longer contamination is left in the environment the farther it can spread and the more it may cost to clean up. Quick action may lessen damage to your property and neighboring properties and reduce your costs in investigating and cleaning up the contamination. To ensure that your cleanup complies with Wisconsin's laws and administrative codes, you should hire a professional environmental consultant who understands what needs to be done. These are the first four steps to take:

1. By November 30, 1997, please submit written verification (such as a letter from the consultant) that you have hired an environmental consultant. You will need to work quickly to meet this timeline.

2. By December 30, 1997, your consultant must submit a workplan and schedule for the investigation. The consultant must follow the DNR administrative codes and technical guidance documents. Please include with your workplan a copy of any previous information that has been completed (such as a preliminary excavation report).

3. Please inform DNR of what is being done at your site. Submittal requirement timelines depend on the contaminants at the site. As described in s. NR 700.11, if the site meets criteria for a "simple site", progress reports must be submitted semi-annually, beginning 6 months from the initial notification date. If the site meets criteria for a "complex site", the site investigation report and a draft remedial options report must be submitted to DNR within 30 days of completion of both reports. Your consultant must clearly document the extent and degree of soil and groundwater contamination and submit a proposal for cleaning it up.

4. For complex sites, per s. NR 724.13(3), you or your consultant must provide a brief report at least every 90 days, starting after the remediation system begins operation. The reports should summarize the work completed since the last report. Quarterly reports need only include one or two pages of text, plus any relevant maps and tables. However, should conditions at your site warrant, we may require more frequent contacts with the Department.

Due to the number of contaminated sites and our staffing levels in DNR's Southeast Region, we will be unable to provide workplan approvals for investigations or remedial actions. To maintain your compliance with the spills law and chs. NR 700 through NR 728, do not delay the investigation and cleanup of your site by waiting for DNR response. We have provided detailed technical guidance to environmental consultants. Your consultant is expected to know our technical procedures and administrative codes and should be able to answer your questions on meeting cleanup requirements.

Your correspondence and reports regarding this site should be sent to:

Michael Farley, BRR Program Assistant
Wisconsin Department of Natural Resources
Box 12436
4041 N Richards St
Milwaukee WI 53212

Unless otherwise requested, please send only one copy of plans and reports. To speed processing, correspondence should reference the BRRTS and FID numbers shown at the top of this letter.

Information for Site Owners:
Enclosed is a list of environmental consultants and some tips on selecting one. If you are eligible for reimbursement of costs under Wisconsin's PECFA program (see last paragraph) you will need to compare at least three consultants' proposals before hiring a consultant. Consultants and laboratories working in the PECFA program are required to carry errors and omissions insurance to help protect you against unsuitable work. Also enclosed are materials on controlling costs, understanding the cleanup process, and choosing a site cleanup method. Please read this information carefully.

If you are interested in obtaining the protection of limited liability under s. 292, Stats., please call 1-800-367-6076 in DNR's Madison office for more information. The liability exemption under s. 292 Stats., is available to persons who meet the definition of "purchaser" in s. 292 and receive DNR approval for the response actions taken at the property undergoing cleanup. DNR will determine eligibility for this program on a case-by-case basis, prior to the "purchaser" developing a scope of work for conducting a ch. NR 716 site investigation.

Financial Information:
Reimbursement from the Petroleum Environmental Cleanup Fund (PECFA) is available for the costs of cleaning up contamination from eligible petroleum storage tanks. The fund is administered by the

Department of Commerce. Please contact the Department of Commerce at (608) 266-2424 for more information on eligibility and regulations for this program.

Thank you for your cooperation.

Sincerely,

Pat Chung

CERTIFIED MAIL

NOTICE OF VIOLATION

RE: Your property at 6203 W. National Avenue, West Allis, WI.

Dear Mr. Libbey:

The Department of Natural Resources has reason to believe that you are in violation of s. 292.11(3), Wis. Stats., which states a person who possesses or controls a hazardous substance which is discharged or who causes the discharge of a hazardous substance shall take the actions necessary to restore the environment.

The Department received a letter from S.A.G. Environmental, Inc. (SAG) dated March 31, 1997. In this letter SAG stated that they were contracted by Viking Land Mobile Communications to investigate contamination from a leaking underground storage tank. In order to fully define the degree and extent of contamination from the leaking tank, they attempted to seek permission from you to access your property at 6203 W. National Avenue to conduct investigative activities. Their permission to access your property was denied.

Samples collected during SAG's investigation indicate soil contamination on the property boundary line between Viking's Building and your property at 6203 W. National Avenue. In addition, a groundwater sample collected on March 6, 1997, contained 48,000 ppb Diesel Range Organics and 570 ppb Gasoline Range Organics.

The Department sent you a letter dated May 1, 1997, requesting that you cooperate with SAG and allow them access to your property. This letter stated that DNR could conclude that you have asserted "possession or control" of the hazardous substances located on your property if you didn't allow the adjacent landowner access to your property.

Department records indicated that you still have not allowed SAG to access your property and conduct investigative activities. The Department has therefore concluded that you have taken control of the hazardous substance since you have denied access to Viking's consultant. In response to this conclusion, the Department issued a responsible party letter to you on October 30, 1997. This letter required you to take the actions necessary to restore the environment.

Department records indicate that you have not hired an environmental consultant or provided investigative and remedial reports pursuant to the October 30, 1997, letter.

The following enforcement conference has been scheduled to discuss this matter:

Conference Date:	March 10, 1998
Conference Time:	10:00 a.m.
Location:	SER Headquarters Office 2300 N. Dr. Martin Luther King, Jr., Drive Milwaukee, WI 53212

The Department requests that you bring to the conference copies of any documentation you may have, such as consultant's reports or soil sampling results, that shows you have taken action to restore the environment.

Please be advised that under s. 281.98(1), Wis. Stats., the Department is authorized to seek forfeitures of up to $5,000 per day for violations of Wisconsin's Spill Law.

You can contact me at (414) 263-8670 or Pat Chung at (414) 263-8688 if you have any questions on this matter.

Sincerely,

David Dahms

Re: Proposed borings within City of West Allis "public right-of-way" and adjacent to Viking Communications, 1421 S. 62nd Street, West Allis, WI 53214
WDNR LUST File # 03-41-114435

Dear Mr. Kolbow,

This letter is to request permission to perform a soil boring and install a groundwater monitoring well within the sidewalk adjacent to the above referenced property. Mr. Sal Dragotta, owner of Viking Communications, has contracted with S.A.G. Environmental, Inc. (SAG) to perform investigation and remediation activities related to petroleum released from a Leaking Underground Storage Tank (LUST) on the subject property. Petroleum impacted soil and groundwater were detected during the initial site investigation, in March 1997. SAG's numerous unsuccessful attempts to access the northern ½ of the parking lot, owned by Mr. Richard Libbey, has prompted SAG to continue investigation activities on only the subject property (Figure 2). Remediation activities will include a barrier system to inhibit soil contamination from Mr. Libbey's property, 6203 W. Greenfield Ave., from migrating onto the subject property.

To continue investigation and remediation design activities, SAG requires additional soil and groundwater samples. The proposed location of the soil borings and monitoring wells are detailed in Figure 3. A maximum depth of 20 feet is expected for both boring and wells. Based on a March 3, 1998 phone conversation with your department, written permission and fees are required for the soil boring and monitoring well in the sidewalk area. SAG will contact "Diggers Hotline" and adjust the final boring and well locations to avoid any marked utilities in the area. Your expedience in reviewing and responding to this request would be greatly appreciated.

Thanks for your cooperation. If you have any questions, please call me at (414) 427-1730.

Sincerely,

S.A.G. Environmental, Inc.

Mr. Richard Libbey
6070 Shady Lane
Hartford, WI 53027

CERTIFIED MAIL

Dear Mr. Libbey:

Thank you for meeting with us to discuss the Notice of Violation that was issued to you regarding your property located at 6201 W. National Avenue, West Allis, WI. If you are not in agreement with the summary of this meeting please contact the Department.

Meeting Date: March 24, 1998.

Location: DNR Southeast Region Headquarters Office.

Attendance list is attached.

Conference Agreement

Mr. Libbey agreed to contact Viking Communications to see if Viking would investigate Mr. Libbey's property to determine if contamination on the Viking property had migrated onto the property at 6201 W. National Avenue. If Viking is willing to investigate Mr. Libbey's property, Mr. Libbey agreed to with discuss with Viking, the possibility of signing an access agreement for Mr. Libbey's property. The Department made it clear that if an agreement could not be reached within 45 days (May 11, 1998), Mr. Libbey would need to hire a consultant and perform an investigation to define the degree and extent of contamination on Mr. Libbey's property.

Summary of Discussion

Mr. Libbey stated that he was never contacted by Viking's Consultant requesting access to 6201 W. National Avenue. Mr. Libbey stated that he was sent a certified letter requesting access to 6135 W. Greenfield Avenue, but this address was not the property adjacent to the leaking underground storage tank (LUST) site. Mr. Libbey felt it was not his responsibility to correct this error. Dave Dahms stated that despite this discrepancy, it should have been apparent to Mr. Libbey that the contractor was requesting access to 6201 W. National Avenue.

Mr. Libbey stated that despite never granting access, Viking's consultant drilled holes on his property. Mr. Libbey stated that two men in a white Toyota pick-up drilled holes on his property and began to place a plastic tube into the holes. Mr. Libbey stated that the tubes contained a black, tar-like substance. Mr. Libbey stated that he kicked the men off his property and threw the black material onto Viking's property.

Walt Ebersohl stated that these were serious allegations Mr. Libbey was making about Viking's consultant. Mr. Ebersohl wondered if the black material was part of a soil or groundwater sample that was being collected. Gina Keenan recommended that Mr. Libbey try and work out an access agreement with Viking if Mr. Libbey was concerned about Viking's consultant. Mr. Libbey would then be able to have input as to what the contractor could and could not do on his property (e.g. require the contractor to work on site only when Mr. Libbey is present).

Mr. Ebersohl stated that the Department has already asserted that Mr. Libbey has taken control of the hazardous substance on his property and that if Viking did not want to sign an agreement with Mr. Libbey, then Mr. Libbey would be responsible for cleaning up the 6201 W. National Avenue property.

Please contact me at (414) 263-8670 or Gina Keenan at (414) 263-8589 if you have any questions.

Sincerely,

David Dahms

Re: Proposal for Environmental Consulting at Parking Lot, 6203 W. National Avenue, West Allis, Wisconsin

Dear Mr. Libbey:

This proposal is in response to your letter, dated March 26, 1998, requesting a site address correction and an "access agreement" form, or advice. According to the City of West Allis plat maps, the property directly north of Viking Communications property, at 1421 S. 62nd Street, is designated as 6203 W. National Avenue (Tax Key #454-0071-002). Please refer to your property tax statements to confirm this. I will continue referring to the parking lot as 6203 W. National Avenue, unless you can provide additional information indicating that the parking lot has a street address of 6201 W. National Avenue.

Concerning the "access agreement" form you requested, S. A. G. Environmental, Inc. (SAG) is no longer able provide this option for investigating petroleum contamination suspected to be at the above referenced property. As of October 30, 1997, you have assumed legal and financial responsibility for any petroleum contamination on the subject property. In accordance with Wisconsin Administrative Codes chapters NR700 through NR728, SAG recommends you hire an environmental consultant. To expedite site investigation activities and decrease site clean-up costs at both 1421 S. 62nd Street and the subject property, SAG is willing to provide our environmental consulting services for both properties. SAG is already contracted with Viking Communications, therefore SAG is submitting this proposal for your review. The proposal includes:

- a proposed scope of work;
- a schedule of fees;
- a statement of qualifications, including related experience and references;

Based on the current site information, the suspected petroleum contamination on your property is not eligible for reimbursement through the Petroleum Environmental Cleanup Fund (PECFA). Thank you for your consideration. We look forward to working with you on this project. If you have any questions, please call us at (414) 427-1730.

Sincerely,
S. A. G. Environmental, Inc.

HARTFORD, WI 53027

Subject: Reminder to Evaluate Vapor Intrusion Pathways for:
COD PLUMBING SUPPLY INC
BRRTS #: 02-41-174765, FID: 241943900

Greetings:

This letter is being sent to all Responsible Parties (RP's) that currently have an open contamination site on the DNR's Bureau for Remediation and Redevelopment Tracking System (BRRTS). **The purpose is to remind RP's to assess the vapor intrusion pathway as early in the cleanup process as possible, preferably during the site investigation phase.**

Chapter NR 716, Wisconsin Administrative Code outlines the requirements for investigation of contamination in the environment. Specifically, s. NR 716.11(3)(a) requires that the field investigation determine the "nature, degree and extent, both areal and vertical, of the hazardous substances or environmental pollution in **all** affected media". In addition, section 716.11(5) specifies that the field investigation include an evaluation of the "pathways for migration of the contamination, including drainage improvements, utility corridors, bedrock and permeable material or soil along which **vapors**, free product or contaminated water may flow".

While many RP's and their consultants have been assessing the vapor intrusion pathway, there have been a number of situations where this pathway had not been evaluated at the time a case closure request was submitted. In some cases this resulted in the need for additional field work which ultimately delayed case closure.

In order to ensure the vapor intrusion pathway was evaluated, you need to include documentation with the Site Investigation Report that explains how the assessment was done and why the pathway was ruled out. **If the pathway cannot be ruled out, then investigation and, if appropriate, remedial action must be taken to address the risk presented prior to submitting the site for closure.** The Department can provide technical assistance at any point throughout the investigation and cleanup process for a fee. These services can be requested using the form available at: http://dnr.wi.gov/aw/rr/Services_Fees/index.htm#form. Checking in early can help save time and money during the cleanup process.

The DNR has developed guidance to help RP's and their consultants comply with the requirements described above. The guidance includes a detailed explanation of how to assess the vapor intrusion pathway and provides criteria which identify when an investigation is necessary. The guidance is available at: http://dnr.wi.gov/org/aw/rr/archives/pubs/RR800.pdf.

If you have any questions regarding this letter, please do not hesitate to contact your DNR project manager:

WDNR FID #241943900 BRRTS #02-41-174765

Dear Mr. Libbey:

The Department of Natural Resources is undertaking a project to address open environmental contamination cases that have been inactive for several years. We are sending letters to those property owners to determine the status of these cases and to request additional work, if necessary. We appreciate your cooperation and understanding as we try to resolve these old cases.

In our review of the above-referenced case, the Department found the most recent document to be a letter to you from the Department dated March 26, 1998 (copy enclosed). The letter summarized the March 24, 1998 enforcement conference that you attended with the Department to discuss the Notice of Violation that was issued to you on February 26, 1998. At the meeting, it was mutually agreed that you would initiate contact with Viking Communications regarding site access or, if an access agreement could not be reached, you would hire a consultant to perform an investigation on your property. Since 1998, the adjacent site at 1421 S. 62nd Street, owned by Viking Communications, has been successfully remediated and granted case closure.

Our files indicate that we have not received any written correspondence or reporting for your site since 1998. Please have your environmental consultant prepare and submit documentation regarding the status of your case. If you do not have a consultant, please notify the Department in writing within the next **thirty days** as to your intentions to submit the requested documentation.

If you do not respond, the Department will begin the process of recording a Notice of Contamination (affidavit) on your property deed to notify of an open environmental contamination case at the site.

The Department understands that there has been some confusion as to the correct address for your site. Please refer to the attached parcel map from the City of West Allis. The mailing address for the highlighted property may be 6201 W. National Avenue, however, for tax and legal identification purposes the City identifies it as 6203 W. National Avenue.

Forward the requested update, detailing the current status of the case, and all future correspondence to:

Ms. Victoria Stovall
Remediation and Redevelopment Program
Wisconsin Department of Natural Resources
2300 N. Dr. Martin Luther King, Jr. Drive
Milwaukee, WI 53212

Correspondence should reference the "Subject" name and WDNR FID and BRRTS reference numbers listed above.

If you have questions regarding this letter or the project, please contact me at (414) 263-8631 or StephenD.Mueller@Wisconsin.gov.

Sincerely,

Stephen D. Mueller

CERTIFIED MAIL

Dear Mr. Libbey:

Thank you for meeting with us to discuss the Notice of Violation that was issued to you regarding your property located at 6201 W. National Avenue, West Allis, WI. If you are not in agreement with the summary of this meeting please contact the Department.

Meeting Date: March 24, 1998.

Location: DNR Southeast Region Headquarters Office.

Attendance list is attached.

Conference Agreement

Mr. Libbey agreed to contact Viking Communications to see if Viking would investigate Mr. Libbey's property to determine if contamination on the Viking property had migrated onto the property at 6201 W. National Avenue. If Viking is willing to investigate Mr. Libbey's property, Mr. Libbey agreed to with discuss with Viking, the possibility of signing an access agreement for Mr. Libbey's property. The Department made it clear that if an agreement could not be reached within 45 days (May 11, 1998), Mr. Libbey would need to hire a consultant and perform an investigation to define the degree and extent of contamination on Mr. Libbey's property.

Summary of Discussion

Mr. Libbey stated that he was never contacted by Viking's Consultant requesting access to 6201 W. National Avenue. Mr. Libbey stated that he was sent a certified letter requesting access to 6135 W. Greenfield Avenue, but this address was not the property adjacent to the leaking underground storage tank (LUST) site. Mr. Libbey felt it was not his responsibility to correct this error. Dave Dahms stated that despite this discrepancy, it should have been apparent to Mr. Libbey that the contractor was requesting access to 6201 W. National Avenue.

Mr. Libbey stated that despite never granting access, Viking's consultant drilled holes on his property. Mr. Libbey stated that two men in a white Toyota pick-up drilled holes on his property and began to place a plastic tube into the holes. Mr. Libbey stated that the tubes contained a black, tar-like substance. Mr. Libbey stated that he kicked the men off his property and threw the black material onto Viking's property.

Walt Ebersohl stated that these were serious allegations Mr. Libbey was making about Viking's consultant. Mr. Ebersohl wondered if the black material was part of a soil or groundwater sample that was being collected. Gina Keenan recommended that Mr. Libbey try and work out an access agreement with Viking if Mr. Libbey was concerned about Viking's consultant. Mr. Libbey would then be able to have input as to what the contractor could and could not do on his property (e.g. require the contractor to work on site only when Mr. Libbey is present).

Mr. Ebersohl stated that the Department has already asserted that Mr. Libbey has taken control of the hazardous substance on his property and that if Viking did not want to sign an agreement with Mr. Libbey, then Mr. Libbey would be responsible for cleaning up the 6201 W. National Avenue property.

Please contact me at (414) 263-8670 or Gina Keenan at (414) 263-8589 if you have any questions.

Dear Mr. Libbey:

In response to your February 13, 2012 letter, it is the policy of the Environmental Enforcement Program to maintain original document receipts for ten years. Therefore, since the March 26, 1998 letter was sent to you by Certified Mail more than ten years ago, the Department of Natural Resources cannot provide a copy of the delivery confirmation.

Thank you for communicating with the Department. As you mentioned in your letter, we look forward to receiving an update from you shortly regarding the status of your case.

Please forward the requested update and all future correspondence to:

Ms. Victoria Stovall
Remediation and Redevelopment Program
Wisconsin Department of Natural Resources
2300 N. Dr. Martin Luther King, Jr. Drive
Milwaukee, WI 53212

Correspondence should reference the "Subject" name and file reference numbers listed above.

If you have questions regarding this letter or the project, please contact me at 414-263-8631.

Sincerely,

Stephen D. Mueller
Project Manager/Hydrogeologist
Bureau for Remediation & Redevelopment

CERTIFIED MAIL
70073020000069177887

Dear Mr. Libbey:

In response to your March 13, 2012 letter, the Department of Natural Resources (Department) would like to provide a review of the open contamination and correspondence sent by the Department for the site identified above. This letter also serves to notify you that you have failed to comply with the Hazardous Substances Spills Law (section 292.11, Wisconsin Statutes).

May 1, 1997
Petroleum-impacted soil and groundwater, resulting from leaking underground storage tanks, had been discovered on the Viking Communications site, adjacent to your property on the south side. The Department sent you a letter requesting that you cooperate with S.A.G. Environmental (Viking Communication's consultant for the adjacent site) and allow them access to your property. The Department urged you to comply, because it is possible that this contamination has migrated onto your site. This letter stated that the Department could conclude that you have asserted "possession or control" of the hazardous substances located on your property if you did not allow the adjacent landowner access to your property. Copy enclosed.

October 2, 1997
The Department sent you a second letter inviting you to attend a meeting to discuss this issue, since you had not cooperated with Viking's representatives or their consultant, S.A.G. Environmental, to permit investigation activities on your property. Copy enclosed.

October 30, 1997
The Department concluded that you have taken control of the hazardous substances on your property and issued a responsible party letter to you. This letter required you to take the actions necessary to restore the environment. Copy enclosed.

February 26, 1998
The Department sent you a Notice of Violation and requested that you attend an enforcement conference on March 10, 1998. Copy enclosed.

March 26, 1998
The Department sent you a summary of the discussion that occurred at the enforcement conference on March 24, 1998. At the conference, you agreed to initiate contact with Viking regarding site access or, if an access agreement could not be reached, you would hire an environmental consultant to perform an investigation on your property. Copy enclosed.

January 11, 2012
The Department sent you a letter requesting an update regarding the status of your case. We have not received any information from your consultant, nor have we received documentation regarding your intentions to remediate the site. Copy enclosed.

February 22, 2012
The Department sent you a letter addressing your request for delivery confirmation of the March 26, 1998 letter. This letter explained that original document receipts were maintained for ten years. Copy enclosed.

The DNR case file also includes copies of correspondence that Viking's environmental consultant, S.A.G. Environmental, sent to you to 1) gain access to your property to complete the site investigation in 1997 and 2) offer a proposal to perform environmental consulting in 1998.

Milwaukee County assessment records confirm that you are the current property owner and are, therefore, responsible for investigating and restoring the environment at the above site under Section 292.11, Wisconsin Statutes. The Hazardous Substances Spills Law states:

> "A person who possesses or controls a hazardous substance which is discharged or who causes the discharge of a hazardous substance shall take the actions necessary to restore the environment to the extent practicable and minimize the harmful effects from the discharge to the air, lands, or waters of the state."

Under the Spills Law, you have a legal responsibility to clean up all contamination to the extent practicable. Our information indicates that you have not started the investigative work necessary to determine the method and degree of clean up needed to bring your site into compliance with the Spills Law. Due to the release of a hazardous substance to the environment, you are responsible for conducting a remedial investigation to determine the extent of contamination. Remedial actions must be taken to clean up contaminated soils and groundwater, if applicable.

Please submit evidence that you have hired an environmental consultant, as well as a work plan outlining how you plan to proceed with the investigation by **November 1, 2012**.

Forward the requested information, in writing, and all future correspondence to:

Ms. Victoria Stovall
Remediation and Redevelopment Program
Wisconsin Department of Natural Resources
2300 N. Dr. Martin Luther King, Jr. Drive
Milwaukee, WI 53212

Correspondence should reference the "Subject" name and file reference numbers listed above.

Although the Department does not review a case at every stage of the investigation and clean up, you are still required by the Spills Law to take the steps necessary to restore the environment to the extent practicable. Your

environmental consultant should be knowledgeable in the applicable State environmental codes and DNR technical guidance documents to assist you in meeting Wisconsin's clean up standards.

If the investigation does not proceed, the Department will have no choice but to initiate the enforcement process, which will likely include the placement of a deed affidavit on your property. The deed affidavit will serve to warn potential purchasers of the environmental contamination that is present on the property. While you have previously received enforcement notices, be advised that the Department now has resources to proceed with these enforcement actions.

If you are having difficulty financing the investigation and clean up of this property and would like to demonstrate an inability to pay for the required work, the Department can offer you an opportunity to complete a financial disclosure form and provide information about your tax filings. The Department would review and verify your inability to pay. This information would be placed in your case file as a record of your efforts to respond to the contamination.

Sites where discharges to the environment have been reported are entered into the Bureau for Remediation and Redevelopment Tracking System ("BRRTS"), a version of which appears on the Department's internet site. You may view the information related to this site at any time (http://dnr.wi.gov/org/aw/rr/brrts) and use the feedback system to alert us to any errors in the data.

We encourage you to visit our website at http://dnr.wi.gov/org/aw/rr, where you can find information on selecting a consultant, financial assistance and understanding the clean-up process. You will also find information about liability clarification letters, post-cleanup liability and more.

If you have questions regarding this letter or the site, please contact me at 414-263-8631.

Sincerely,

Stephen D. Mueller
Project Manager / Hydrogeologist
Bureau for Remediation & Redevelopment

COD Plumbing Supply site at 6203 W. National Ave, West Allis, WI
WDNR FID #241943900 BRRTS # 02-41-174765

Dear Mr. Libbey:

Thank you for attending a meeting at the Department of Natural Resources (DNR) office to discuss the status of the open contamination case referenced above. The meeting was attended by Richard Libbey, Steve Mueller, Saji Villoth, and Michele Norman. During the meeting, we reviewed the DNR's notification process and prior written communications sent to Mr. Libbey. Mr. Libbey stated that he had not received several letters sent to him from the DNR, so we confirmed all contact information. Mr. Libbey agreed to select an environmental consultant before the end of 2012 and notify the DNR, in writing, of his selection. (Please refer to the enclosures regarding consultant selection.) Michele Norman will send Mr. Libbey an e-mail with links to Internet sources that may be helpful to understand the Remediation and Redevelopment program and the consultant selection process. Steve Mueller offered to explore the eligibility of Mr. Libbey's site within the PECFA program.

All future correspondence should reference the "Subject" name and file reference numbers listed above. Please send the information to my attention at:

Subject: File Review Update
COD Plumbing Supply site at 6203 W. National Ave, West Allis, WI
WDNR FID #241943900 BRRTS # 02-41-174765

Dear Mr. Libbey:

The purpose of this letter is to update you on the file review activities being performed by the Wisconsin Department of Natural Resources (DNR) regarding the open contamination case referenced above.

As we discussed during our Case File Review meeting on November 28, 2012, we are working to determine if your site is eligible for reimbursement through the PECFA program. The PECFA (Petroleum Environmental Cleanup Fund Award) program was created in response to enactment of federal regulations requiring release prevention from underground storage tanks and cleanup of existing contamination from those tanks. PECFA is a reimbursement program returning a portion of incurred remedial cleanup costs to owners of eligible petroleum product systems including home heating oil systems. Program funding is generated from a portion of a $0.02/gallon petroleum inspection fee.

Steve Mueller has reviewed the PECFA program activities for the Viking Communications site, directly south of your site, with the Wisconsin Department of Safety and Professional Services (DSPS), formerly the Department of Commerce. Steve is in the midst of conversations with DSPS personnel to determine the eligibility of your site.

We requested retrieval of the Viking Communications file from archives, and it was delivered to our office last week. Steve and I plan on reviewing the file after the holidays in January.

During our November meeting you agreed to select an environmental consultant before the end of 2012 and notify the DNR, in writing, of your selection. Since we are still reviewing the Viking Communications file and determining your PECFA eligibility, we will postpone your need to select a consultant in 2012. We will contact you when we have finished our analysis and discuss an appropriate plan to move forward.

If you have any questions, please call me at 414-263-8546.

Sincerely,

Michele R. Norman
Hydrogeologist, Remediation & Redevelopment

Subject: Action Request
COD Plumbing Supply site at 6203 W. National Ave, West Allis, WI
WDNR FID #241943900 BRRTS # 02-41-174765

Dear Mr. Libbey:

The purpose of this letter is to update you on the review activities performed by the Wisconsin Department of Natural Resources (DNR) regarding the open contamination case referenced above.

Steve Mueller and I have reviewed the case file for the Viking Communications site, directly south of your site, with the Wisconsin Department of Safety and Professional Services (DSPS), formerly the Department of Commerce. The Viking case file indicates that piping from the fuel oil underground storage tank (UST) on the Viking site extends or extended onto your property to heat the COD building. Both the COD and Viking parcels were owned in common by Mr. Charles Kalashian, prior to the sale of the northern parcel to you and the southern parcel to Mr. Salvatore Dragotta, owner of Viking Communications.

Based on the site investigation performed on the Viking parcel, contamination appears to extend onto the COD site. Therefore, a site investigation on the COD property is required, specifically the piping run from the fuel oil UST to the COD building.

We recommend that you hire a PECFA-registered consultant to perform the site investigation and any necessary remediation. For your initial review, we have included a list of PECFA consultants, registered with DSPS, having the same zip code as your site, 53214. We also suggest that you and/or your consultant contact Dennis Legler, Section Chief of the PECFA Claim Review Section at DSPS, directly to discuss your site's PECFA eligibility. Mr. Legler's office phone number is (608) 267-7642 and his e-mail is dennis.legler@wisconsin.gov. We are aware of a similar situation with a shared tank system on adjacent parcels that received PECFA funding.

By April 1, 2013, provide written notification of your consultant selection. By May 1, 2013, your consultant must submit a workplan and schedule for the investigation.

Please forward the requested information, in writing, and all future correspondence to:

Dear Mr. Libbey:

The purpose of this letter is to respond to your recent correspondence, dated March 20, 2013, that you submitted to the Wisconsin Department of Natural Resources (DNR) regarding the open contamination case referenced above.

I reviewed your letter and the enclosed information with Steve Mueller and Saji Villoth. Your notes from 1997 made during the tank excavation and subsequent drilling activities and the Milwaukee Journal Sentinel article had been previously submitted to the DNR and were contained in the case file.

We will agree to schedule another meeting with you after you have retained an environmental consultant and a workplan with a schedule has been submitted to the DNR. By **June 1, 2013**, provide written notification of your consultant selection. By **July 1, 2013**, your consultant must submit a workplan and schedule for the investigation.

Please forward the requested information, in writing, and all future correspondence to:

Dear Mr. Libbey:

The purpose of this letter is to respond to your recent correspondence, dated April 18, 2013, that you submitted to the Wisconsin Department of Natural Resources (DNR) regarding the open contamination case referenced above.

I reviewed your letter and the enclosed information with Steve Mueller and Saji Villoth. Your letter states that you are "living on a fixed income (mostly Social Security)" implying that you may not have the financial resources to conduct a site investigation and if necessary, complete remedial actions to address the on-site contamination.

The Department is offering you an opportunity to demonstrate that you are financially incapable of paying for the required work by completing the enclosed forms and providing the requested information:

1. Individual Ability to Pay Claim – "Financial Data Request Form"
2. Copies of federal tax filings from the last three years
3. IRS Form 8821

IRS Form 8821 authorizes Ms. Shelley Fox to access your tax information from the Internal Revenue Service in the event of a discrepancy with your submitted information to determine your ability to pay for site clean-up.

Due to the personal information on these forms, DO NOT fax these documents. Please mail the requested information to:

WDNR – RR
Ms. Shelley Fox
PO Box 7921
Madison, WI 53707-7921

Within **thirty (30) days** from the date of this letter, please submit the requested information. If you choose not to do so, I will assume you are no longer interested in claiming that you cannot perform the work due to financial reasons.

The Department will review, verify, and analyze the information you submit. The Department will contact you if additional information or clarification is needed. Upon completion of the verification and analysis, the Department will notify you with our determination.

If you have any questions, please call me at 414-263-8546. Regarding the Department's "Ability to Pay" program, please contact Shelley Fox at 608-266-5798.

Sincerely,

Michele R. Norman

Dear Mr. Libbey:

The purpose of this letter is to respond to your correspondence, dated October 14, 2013 (enclosed).

You requested the following information from the Wisconsin Department of Natural Resources (DNR):

1. Electronic copy of the file.

   A copy of the DNR file may be requested. The cost to reproduce the file is $0.165 per page. I have calculated the total cost to be $41.25. You may also review the file in-person by scheduling a time with Mr. David Hanson, Environmental Program Associate, at (414) 263-8680.

2. Copy of conference video.

   Not available.

3. Copy of your department policy on how to appeal.

   As stated in my September 17, 2013 letter to you, I reviewed your case with the DNR's Environmental Enforcement Program. To appeal the identification of your site as being contaminated, you must provide sampling results to confirm the absence of contamination.

4. Copy of photos taken by state employee during excavation.

   Not available.

Within **thirty (30) days** from the date of this letter, please submit information regarding your plans to address the contamination on this site. We recommend that you hire an environmental consultant to perform a site investigation. If you choose not to investigate the reported contamination, the DNR will send you a formal Notice of Violation before recording a deed affidavit with the Milwaukee County

Register of Deeds to notify the public and future property owners that contamination exists on your property.

Please forward written correspondence to:

Dear Mr. Libbey:

Notice of Violation

The Department of Natural Resources has reason to believe that the Richard Libbey & Eva Revocable Trust is in violation of the following hazardous substance and remedial action requirements at the property you own located at 6203 W. National Avenue in the City of West Allis.

- Section 292.11(3), Wis. Stats., states "**Hazardous substance spills-Responsibility.** A person who possesses or controls a hazardous substance which is discharged or who causes the discharge of a hazardous substance shall take the action necessary to restore the environment to the extent practicable and minimize the harmful effects from the discharge to the air, land or waters of this state."
- Section NR 716.05(1), Wis. Adm. Code, states "When site-specific or facility-specific information indicates that soil, sediment, groundwater, surface water, air or other environmental media at a site or facility may have become contaminated, persons identified under s. NR 716.02(1) shall conduct a site investigation consistent with this chapter."
- Section NR 722.05(1), Wis. Adm. Code, states "Responsible parties shall select an appropriate remedial action or combination or remedial actions for implementation under this chapter, unless the department makes a selection under sub. (2).

The Department has been attempting to work with you since 1997. At that time, an investigation of the adjacent property by S.A.G. Environmental found levels of Diesel Range Organics (DRO) of 48,000 parts per billion and Gasoline Range Organics (GRO) of 570 parts per billion in the groundwater. Attempts to facilitate an access agreement with the adjacent property owner or to get you to conduct your own investigation have not been successful.

In order to discuss this matter, the following enforcement conference has been scheduled:

Conference Date:	March 26, 2014
Conference Time:	9:00 a.m.
Location;	DNR Southeast Region Headquarters 2300 N. Dr. Martin Luther King Drive Milwaukee, WI 53212

We encourage you to attend the enforcement conference as it is an opportunity to discuss the circumstances surrounding the alleged violations and for us to learn your perspective on this matter.

Under s. 292.99, Wis. Stats, the department is authorized to seek forfeiture of up to $5,000 for each day of violation.

If you have any questions or need to reschedule the conference, please contact me at (414) 263-8671.

Sincerely,

Debby Roszak
Environmental Enforcement

c: Michelle Norman
Attorney Lacey Cochart

Environmental Enforcement Conference

An Enforcement Conference (EC) is a meeting between Department of Natural Resources staff and representatives of a person or business that the Department believes has violated an environmental law. The Department issues a Notice of Violation (NOV) when it has reason to believe that a violation of a permit condition, administrative rule or statutory requirement has occurred. The NOV either offers or schedules an EC.

Why Should I Attend?
The EC is an important opportunity to discuss the Department's basis for the alleged violation(s) and learn more about what happened, why it may have happened, and any factors you believe the Department should consider, such as steps that have been or will be taken to stop the violation, correct any effects of the violation, and prevent violations from occurring in the future. It is also your opportunity to explain why you might disagree with the factual and legal conclusions underlying the NOV.

Historic data shows that most violations are resolved at the EC level, without the need for court ordered compliance and/or penalties. In situations where the significance of the violation warrants further enforcement action, your cooperative efforts to resolve the violation and prevent future violations will help minimize your legal and financial liability.

Who Should Attend the EC?
Department staff involved in the EC typically consists of an Environmental Enforcement Specialist and regulatory staff that are familiar with the issues identified in the NOV.

While not required, you may seek representation by legal counsel or the assistance of an environmental consultant to prepare for and/or attend the EC. The EC is most productive when all involved are well-prepared to discuss the allegations and any corrective actions that may be necessary.

To ensure a productive candid discussion, participation in the EC is limited to the person or business involved and others with the legal or technical expertise necessary to understand, evaluate, mitigate and correct the violation. The EC is not an open meeting under state law and the Department will limit participation to those directly involved in the resolution of the matter.

What Happens if I don't Attend the EC?
If a party is unable to attend the EC, they should immediately contact the Environmental Enforcement Specialist at the phone number in the NOV to reschedule. When a party refuses to attend the EC and provides no further information to the Department, the Department's enforcement decision will be based upon available information.

What Happens Following the EC?
The EC is part of the Department's stepped enforcement process. At the EC, Department staff will explain the process and options available to address the alleged violation. Generally, the options range from closing the matter with no further action to referral to the Wisconsin Department of Justice (DOJ) or to U.S. EPA, for further enforcement action. In limited circumstances, the Department can issue citations, which are handled in local court similar to traffic offenses. If a case is referred to DOJ, the DOJ may initiate an action in court on behalf of the State. The State typically asks the Court to impose financial penalties and order completion of any necessary corrective actions. In most of the Department's cases, a cooperative return to compliance with any necessary restoration results in close out of the case. At close out, the Department will send a letter advising of no further enforcement action.

WISCONSIN DEPT. OF NATURAL RESOURCES

June 13, 2014

Mr. Richard Libbey
6070 Shady Lane – Pike Lake
Hartford, WI 53027

SUBJECT: Final Case Closure with Continuing Obligations
COD Plumbing Supply Inc, 6201 W. National Avenue, West Allis, WI
DNR BRRTS Activity #: 02-41-174765
FID #: 241943900

Dear Mr. Libby:

Thank you for your letter to the Office of the Governor regarding the Department of Natural Resources' (the Department) involvement with your property located at 6201 W. National Avenue. As a response to your request for an upper-level Department Manager to review this situation, I have been asked to examine the specifics of the case and provide you with feedback.

The case file describes how soil contamination was discovered in 1996 during the removal of underground storage tanks from the southern end of the parking lot that your building shares with Viking Communication's (Viking) property. Upon being notified of this discovery, the Department required Viking to investigate the extent of contamination. Viking therefore collected soil samples on their side of the parking lot. These samples were found to be contaminated with petroleum products.

I understand your frustration as to why you are being told to investigate this contamination when the spill did not occur on your property. It may appear that Michele Norman, the Hydrogeologist who was representing the Department, has required you to prove that your property is not contaminated even though the tanks were not located on your property. However, that is not what the Department is requiring. When contamination is discovered at a property, the responsible party must identify the extent of contamination, even if it extends beyond their property boundaries. It was originally Viking's responsibility to determine how far contamination had spread onto your property. By not allowing Viking access to your property in a reasonable amount of time to complete this sampling, it became your responsibility to complete the investigation. This is why the Department required you to complete the investigation which began at Viking's property.

I appreciate your efforts to conduct research into the geologic conditions at your site that could affect the migration of contamination onto your property. The information that Michael Hahn referred you to regarding large-scale, regional groundwater flow is correct. However, when dealing with groundwater flow on a smaller scale, such as within a city block, flow direction can be highly variable depending on a number of factors. Therefore, flow direction in this relatively small area may not necessary follow the regional flows depicted on the map referenced by Mr. Hahn. The Department relies on site specific data collected during these investigations to determine the actual direction of groundwater flow.

The maps provided by Viking/S.A.G. depicting contamination migrating onto your half of the parking lot are based on the results of laboratory testing of soil samples collected from the Viking side of the lot and were created using industry standard practices. You are correct in that S.A.G.'s assertion that contamination is present on your property is based on the extrapolation of available data, and not on actual sample results or observations made on

your property. However, the Department finds these interpretations to be reasonable and agrees with S.A.G.'s conclusion that contamination is likely present on your property. The documentation required to confirm the extent of contamination on your property became your responsibility to provide as soon as you denied Viking access to collect these samples.

While Ms. Norman has been your main contact with the Department, her actions represent those of the Department as a whole. They are consistent with earlier decisions made by the Department and are subject to review by management. The decisions of the Department are based on scientific evidence and the law. In this case, the Department believes that there is strong evidence to support that soil contamination is present on your property. In this situation, the main concern with this type of contamination is documenting it so that interested members of the public can be made aware of its existence. Property owners, like you and anyone who purchases the property from you, must be made aware of the existence of the contamination so that they may take proper precautions to protect themselves from exposure and to ensure that the material is disposed of properly if it is excavated.

You had previously proposed that the Department collect samples from your property to resolve this matter, and that is certainly one option we are willing to consider. We would be expending taxpayer dollars to conduct the sampling that the responsible party was willing to conduct at the time you denied access for this sampling, and so this is a less desirable option for the Department. It may be less desirable for you as well, if we end up having to recover our costs from you. That is because you could negotiate costs with consultants if you hire them yourself. However, given your expressed concern about your ability to pay, and our staff and resources to arrange for this sampling, we are willing to further discuss this option and two other options to resolve this situation.

One of these options would be for you to hire a consultant to prepare a revised map of the residual contamination for the Viking project, which would show the estimated extent of soil contamination projected to exist on your property. This would allow the Department, upon your request, to revise the Department's GIS Registry listing for the Viking project to identify the need to manage soil in the area on your property appropriately. This information will then be available to the public by including the information on the Department's GIS database (accessible at http://dnr.wi.gov/topic/Brownfields/botw.html). We believe this could be accomplished at a much smaller cost for you, because no additional soil sampling would be required, and would also allow the Department to remove the "case" listing we currently have for your property.

We could also proceed to file a notification of contamination on your property deed, based on the information we have. This would relieve you of the cost of having a consultant prepare any documents, but would take care of the need to notify future property owners of the requirement to manage contaminated soil appropriately if it is excavated in the area of the discharge. This we would do at Department expense, and we would provide you a copy of the deed affidavit after it is filed. If you or others choose to conduct sampling in this area in the future, and are able to confirm that no soil contamination is present, the Department could at that time prepare a second deed affidavit to document the new information. We expect that this is not a desirable option for you, but it would resolve the issue quickly and without cost for you.

Finally, you still have the option to hire an environmental consultant to complete the site investigation that began on the Viking side of the parking lot. They will collect soil samples on your property to determine the extent of contamination. If contamination is confirmed and defined on your property, it will be documented on our GIS database. If contamination is not confirmed, the Department will close this case and will not require additional action from you or future owners of your property for this matter. The benefit to you would, in either case, be to have data to provide to prospective purchasers, which could satisfy their need to know and eliminate or reduce the need for additional sampling at that time.

Mr. Richard Libbey
Regarding COD Plumbing Supply Property at
6201 W. National Avenue, West Allis

June 13, 2014

I propose that we meet to discuss all these options, and will attempt to contact you directly. Please feel free to call me to discuss this letter and a meeting, at (414) 263-8561. I would also be happy to put you in contact with our Small Business Ombudsman after we talk further about the case.

Sincerely,

Pamela A. Mylotta, Team Supervisor

Mr. Helmut Toldt
Toldt Development, Inc
4040 N Calhoun Road
Brookfield, WI 53005

Subject: Final Case Closure for Properties 102 and 113 (a.k.a. Former Pressed Steel Tank – Parking Lot Property), located at 1452 S 66th Street and 1441 S 65th Street, West Allis, WI

Dear Mr. Toldt:

On September 17, 2010, the Wisconsin Department of Natural Resources (WDNR) reviewed your request for closure of the case described above. The WDNR reviews environmental remediation cases for compliance with state rules and statutes to maintain consistency in the closure of these cases.

Based on the correspondence and data provided, it appears that your case meets the closure requirements in ch. NR 726, Wisconsin Administrative Code. The Department considers this case closed and no further investigation or remediation is required at this time, however, you and future property owners must comply with certain continuing obligations as explained in this letter.

Please be aware that this case may be reopened pursuant to s. NR 726.09, Wisconsin Administrative Code, if additional information regarding site conditions indicates that contamination on or from the site poses a threat to public health, safety or welfare, or the environment.

GIS Registry

The conditions of case closure set out below in this letter require that your site be listed on the Remediation and Redevelopment Program's GIS Registry. The specific reason is summarized below:

- Residual soil contamination exists that must be properly managed should it be excavated or removed (Property 102 -1452 S 66th Street)

This letter and information that was submitted with your closure request application will be included on the GIS Registry. To review the sites on the GIS Registry web page, visit the RR Sites Map page at http://dnr.wi.gov/org/aw/rr/gis/index.htm. If your property is listed on the GIS Registry because of remaining contamination and you intend to construct or reconstruct a well, you will need prior Department approval in accordance with s. NR 812.09(4)(w), Wis. Adm.

Code. To obtain approval, Form 3300-254 needs to be completed and submitted to the DNR Drinking and Groundwater program's regional water supply specialist. This form can be obtained on-line http://dnr.wi.gov/org/water/dwg/3300254.pdf or at the web address listed above for the GIS Registry.

Residual Soil Contamination

Approximately 32 tons of diesel range organic (DRO) impacted residual soil contamination remains at the site in the area of soil boring AGMSB-9 as indicated **on the attached map** and in the information submitted to the Department of Natural Resources. The area of soil contamination is currently beneath parking lot pavement. If soil in the specific location described above is excavated in the future, then pursuant to ch. NR 718 or, if applicable, ch. 289, Stats., and chs. 500 to 536, the property owner at the time of excavation must sample and analyze the excavated soil to determine if residual contamination remains. If sampling confirms that contamination is present the property owner at the time of excavation will need to determine whether the material is considered solid or hazardous waste and ensure that any storage, treatment or disposal is in compliance with applicable standards and rules. In addition, all current and future owners and occupants of the property need to be aware that excavation of the contaminated soil may pose an inhalation or other direct contact hazard and as a result special precautions may need to be taken to prevent a direct contact health threat to humans.

The Department appreciates your efforts to restore the environment at this site. If you have any questions regarding this closure decision or anything outlined in this letter, please contact Andy Boettcher at (414) 263-8541.

Sincerely,

Andrew F Boettcher
SER Hydrogeologist

Case Closure Request
Form 4400-202 (R 8/09)

WDNR BRRTS CASE # 02-41-543660 and 02-41-543659 WDNR SITE NAME: Properties No. 102 and 113 (Former Pressed Steel Tank Company, Parking Lot Property)

WISCONSIN DEPARTMENT OF NATURAL RESOURCES
Remediation and Redevelopment Program

This form is intended to provide instructions and a list of information that must be submitted for evaluation for case closure, each time a request is made. The closure of a case means that the Department has determined that no further response is required at that time based on the information that has been submitted to the Department.

NOTICE: ***Completion of this form is mandatory*** *for applications for case closure pursuant to ch. 292, Wis. Stats. and ch. NR 726, Wis. Adm. Code, including cases closed under ch. NR 746 and ch. NR 726. The Department will not consider, or act upon your application, unless all applicable sections are completed on this form and the closure fee and any other applicable fees, required under ch. NR 749, Wis. Adm. Code, Table 1 are included. It is not the Department's intention to use any personally identifiable information from this form for any purpose other than reviewing closure requests and determining the need for additional response action. The Department may provide this information to requesters as required by Wisconsin's Open Records law [ss. 19.31 - 19.39, Wis. Stats.].*

In order to expedite the closure process, provide a complete and accurate closure package according to the following instructions, each time a closure decision is requested:

- Submit the Case Closure Request form and the required attachments as a stand-alone, **unbound** package. Include all information requested per section, as appropriate to the site, in the order shown. Include all attachments per section, as appropriate. Do not attach previously submitted reports. Correctly reference any reports in the case summary, as applicable.

- Include fees with this request at the time it is submitted to the department in order for the application to be considered complete.

- Specify your selected closure option.

- **Use forms 4400-245 and 4400-246 for Section H.** Include all **GIS Registry information** (in Section H) as a stand-alone document (*do not refer to materials in other attachments*). Include copies of all off-source property and ROW notifications.

- Place a √(attached) or NA (not applicable) in the blank next to each attachment, in each section.

- Include a maintenance plan, if it is required for the implemented remedial action.

- **Maps for the GIS Registry may not be larger than 8.5 x 14 inches,** unless maps are submitted in electronic form in portable document format (pdf) readable by the Adobe Acrobat Reader. For electronic document submittal requirements, see http://dnr.wi.gov/org/aw/rr/archives/pubs/RR690.pdf.

- Prepare maps according to the applicable portions of ss. NR 716.15(2)(h)1 and 726.05(3)(a)4.d. Prepare visual aids, including maps, plans, drawings, cross sections, fence diagrams, tables and photographs according to s. NR 716.15(2)(h)1. – 4.

- **Use a bold font** on information of importance on tables, maps and figures. A **bold font (for ES exceedances)** and *italics (for PALs)* are preferred when differentiation is necessary. **Please do not use shading or highlights** on any of the analytical tables (per s. NR 726.05(3) and maps as the shading obscures the information that is scanned for inclusion in the GIS Registry.

- Put multiple tables submitted for contaminated media data (eg. pre- and post-remedial data) in chronological order. Include the level of detection for results which are below the detection level (i.e. do not just list as no detect (ND)). Summaries of all data should include information collected by previous consultants. Do not submit lab data sheets unless these have not been submitted in a previous report. Tabulate all data required in s. NR 716.15(2)(g)3 in the format required in s. NR 716.15(2)(h)3.

- Document free product recovery estimates as required in s. NR 708.15, if applicable.

WDNR BRRTS CASE # 02-41-543660 and 02-41-543659 WDNR SITE NAME: Properties No. 102 and 113 (Former Pressed Steel Tank Company, Parking Lot Property)

Section A: Case History and Closure Pathway Selected
ATTACHMENTS:

√ A brief site summary including results of all investigative activities, interim and remedial actions taken, a description of any residual soil and/or groundwater contamination and their locations, a description of any other media affected, and a description of how actual and potential impacts to receptors have been addressed.

√ Site location map on USGS topographic base map.

√ Site map including buildings, utilities, property lines of source property and impacted non-source properties, ground cover and supply wells, including any municipal wells. *These maps may be combined.*

√ Verification of the zoning for affected properties.

INFORMATION NEEDED:

1. Site Name: **Properties No. 102 and 113 (Former Pressed Steel Tank Property, Parking Lot Property)**
   Street Address: **1441 S 65th Street and 1452 S 66th Street**

WDNR BRRTS CASE # 02-41-543660 and 02-41-543659 WDNR SITE NAME: Properties No. 102 and 113 (Former Pressed Steel Tank Company, Parking Lot Property)

Section B: Receptor Summary

ATTACHMENTS:

NA Notification(s) regarding contamination in ROW

NA Notification(s) to off-source property owners regarding sampling results

INFORMATION NEEDED:

1. Identify **all** pre-remedial actual receptors, the assessed risk and their locations (e.g., both on- and off-site utility corridors, basements or sumps of nearby buildings, direct contact threat from soil, water supplies, surface waters, sediments, vapors, etc.) *For definitions, refer to s. NR 700.03 (47), Wis. Adm. Code.*

   Potential receptors evaluated included direct contact with soils from ground surface to 4 feet below ground surface, drinking water supplies, utility corridors, and endangered or threatened species.

2. Have the remedial actions addressed the potential or actual impacts to these receptors?

   x Y **Details are included in the *Risk to Human Health, Safety, Welfare, and the Environment* section under Section B attached.**

   ____N If no, please identify the nature of the remaining risk and the receptor at risk, if any:

Section C: Soil Investigation Information

ATTACHMENTS:

√ Complete soil data summary table of field screening and laboratory analytical results, including all detects, regardless of ch. NR 720 standards, with dates, sample locations, depths and detection limits. Identify exceedances.

√ Map(s) of all pre-remedial soil sampling locations: depicting all soil sample locations relative to site facilities. Note in bold font those sample locations that exceed ch. NR 720 RCLs (including free product location) and delineate the extent of contamination.

NA Pre-remedial geologic cross-sections; including geology, source location(s), extent of soil and groundwater contamination, free product location/depth, soil sample locations, water table elevation, and bedrock elevation, if encountered.

INFORMATION NEEDED:

1. Extent Defined? **x** Y ____N If not, explain why.
2. Soil Type(s): **fill material (silt and sand with and trace gravel in a clay matrix) from ground surface to maximum of 8 feet; clay from 16 to bedrock**
3. Depth of Contamination: Top: **0 feet** Bottom: **4 feet**

   Remaining soil impacts onsite include one location (AGMSB-9) with diesel range organics (DRO) reported above NR720 residual contaminant levels at 679 milligrams per kilogram from 2 to 4 feet.

4. Type of Bedrock: **dolomite** Depth to Bedrock: **120 to 170 feet**
5. Is Any Contaminated Soil (Unsaturated or Saturated) in Contact With the Bedrock? ____Y **x** N
6. Measurable Free Product? ____Y **x** N Depth/Location: **not applicable**

WDNR BRRTS CASE # 02-41-543660 and 02-41-543659 WDNR SITE NAME: Properties No. 102 and 113 (Former Pressed Steel Tank Company, Parking Lot Property)

Section D: Soil Remediation Information

ATTACHMENTS:

√	Map showing remediated area (for example, excavation limits or area influenced by SVE) and locations of post-remediation soil samples (if any). This map should show the locations and extent of residual soil contamination exceeding ch. NR 720 RCLs. These samples should be noted in bold font. *A copy of the map(s) from Section H (form 4400-245) may be used.*
√	Soil disposal documentation
√	NR 720.19 analysis, assumptions and calculations for site specific RCLs (SSRCLs), with justification
NA	Calculations and results of EPA Soil Screening Level Model.
NA	Post-remedial cross-section(s) with post remedial soil sampling results, if soil removal or treatment has occurred. Identify sample results and depths. *A copy of the cross-section(s) from Section H (form 4400-245) may be used or you may refer to the cross-section(s) in Section E, as appropriate.* See Section E.

INFORMATION NEEDED:

1. Remedial Action Completed? **x** Y ____N
2. Were immediate or interim actions conducted? ____Y **x** N If yes, what action was taken?
3. Brief description of remedial action taken:

Leaking Underground Storage Tank (UST)

A 1,000-gallon gasoline UST was removed from the northwest corner of the automotive garage on October 27, 1989 (Figure 2). During the excavation, soil samples were screened with a photo ionization detector (PID) and soils were excavated to remove impacted soils. The tank pit was excavated to the extent practicable, to the limits of the property, to physical barriers and to the maximum depth of soils accessible to the subcontractor. In April 1990, three soil borings were advanced and sampled and then converted to monitoring wells. The wells and borings were installed as MW-1B, MW-2B, and MW-3B. The analytical results indicated the presence of total petroleum hydrocarbons at a concentration of 16 parts per million. No benzene, ethylbenzene, toluene, or xylenes (BETX) were detected in the groundwater samples. The WDNR issued closure for this UST in a letter dated August 27, 1990.

In April 2003, Soil Borings SB-5, SB-6, and SB-7 were advanced near the location of the former UST (Figure 2). Diesel range organics were reported from 6 to 7 feet below land surface (bls) above NR720 residual contaminant level (RCL) of 250 milligrams per kilogram (mg/kg) at 260 mg/kg. Benzene, ethylbenzene, and xylenes were reported above NR720 RCLs from depths ranging from 6 to 11 feet bls. A concentration of 1,2-dichloroethane was also detected above NR140 enforcement standards at MW-1B.

In May 2006, ARCADIS supervised the excavation and onsite staging of impacted soil. The excavation was centered on the location of Soil Boring SB-5 were NR720 RCLs were exceeded for DRO, benzene, ethylbenzene, and xylenes and included the removal of MW-1B as a source. The excavation limits measured approximately 12 by 12 by 12 feet deep. The excavation limits are presented on Figure 6. Soil sidewall confirmation samples were collected and submitted for laboratory analysis of petroleum volatile organic compounds (PVOCs) and lead. All PVOC concentrations were reported below laboratory detection limits and the lead concentrations were reported below the NR720 non-industrial RCL. On June 8, 2006, the staged soil (approximately 129.76 tons) was loaded and transported offsite for disposal at Veolia Emerald Park Landfill, in Muskego, Wisconsin.

Site Redevelopment

Soil polycyclic aromatic hydrocarbon (PAH) concentrations were reported above the proposed direct contact levels for non-industrial sites and above the groundwater protection residual contaminant levels. Based on the wide-spread distribution of the PAH compounds identified in the surface soil, site-specific RCLs were developed for total PAH compounds to further evaluate PAH distribution and risk. ARCADIS used a methodology presented in the PAH Guidance Document (WDNR, 1997), which utilizes a benzo(a)pyrene equivalent and reductive potency factors. Based on the benzo(a)pyrene equivalency calculations, there were no soil PAH analytical results reported above the site-specific RCLs.

Between May and November 2006, soil with low level PAH impacts below the site-specific RCLs was excavated (approximately 9130 cubic yards) to facilitate Site redevelopment (construction of subsurface parking structures). The soil was transported and disposed of at the former Jays Fuel Oil Site (BRRTS No. 02-41-184802) in accordance with Wisconsin Department of Natural Resources NR718 landspreading approval letter dated April 18, 2006.

4. Were soils excavated? x Y____N Quantity: **129.76 tons of nonhazardous soil**

   Disposal Method: **Nonhazardous soil was disposed of at a Veolia Emerald Park Landfill in Muskego, Wisconsin.**

5. Final Confirmation Sample Collection Methods: **Soil sidewall confirmation samples were collected and submitted for laboratory analysis of petroleum volatile organic compounds (PVOCs) and lead from the May 2006 excavation. All PVOC concentrations were reported below laboratory detection limits and the lead concentrations were reported below NR 720 non-industrial RCL.**

6. Final Soil/Drill Cuttings Disposal Location: **Nonhazardous soil was disposed of at Veolia Emerald Park Landfill in Muskego, Wisconsin.**

7. Estimated volume and depth of in situ soils exceeding ch. NR 720 Table RCLs or Site Specific RCLs:

   Approximately 32 tons of diesel range organic impacted soil from an area measuring approximately 10 feet by 10 feet by 5 feet deep at Soil Boring AGMSB-9.

8. Estimated volume and depth of in situ soils exceeding ch. NR 746 Table 1 or Table 2 or Site Specific RCLs (*underground petroleum tank systems, as defined in ch. NR 746 only*): **not applicable**

9. s. NR 720.19 Analysis? x Y_____N

   ___ Performance Standard -NR 720.19(2)

   x SSRCL - NR 720.19(3) and (4), (5) or (6)

   Soil polycyclic aromatic hydrocarbon (PAH) concentrations were reported above the proposed direct contact levels for non-industrial sites and above the groundwater protection residual contaminant levels. Based on the wide-spread distribution of the PAH compounds identified in the surface soil, site-specific RCLs were developed for total PAH compounds to further evaluate PAH distribution and risk. ARCADIS used a methodology presented in the PAH Guidance Document (WDNR, 1997), which utilizes a benzo(a)pyrene equivalent and reductive potency factors. Based on the benzo(a)pyrene equivalency calculations, there were no soil PAH analytical results reported above the site-specific RCLs.

10. If the remedy includes a Soil Performance Standard, what type? ____ **not applicable**

    ____ Cap ____ Soil _____ Building ____ Natural Attenuation of Groundwater ____Other

11. Will the maintenance of the SPS be consistent with the planned post remediation land use?

    ____ Y_____N x **not applicable** If No, please explain:

    _____

12. Is the EPA Soil Screening Level Model used as justification for closure of sites with residual contaminated soils?

    ____ Y x N Are the input numbers used: ____ Site Specific , or _____ WI Defaults?

WDNR BRRTS CASE # 02-41-543660 and 02-41-543659 WDNR SITE NAME: Properties No. 102 and 113 (Former Pressed Steel Tank Company, Parking Lot Property)

Section E: Groundwater Information

ATTACHMENTS:

√ Table identifying all contaminants, summarizing all pre- and post-remediation groundwater analytical results, with sample collection dates *(prepared in accordance with guidance document RR-628)*

√ Groundwater sample location map showing the site facilities and all monitoring wells, sumps, extraction wells, and potable and non-potable wells.

NA Isoconcentration map(s) when included as part of the site investigation or map(s) of the horizontal extent of contamination based on most recent data. *A copy of the map(s) from Section H (from 4400-245) may be used.*

√ A map showing groundwater flow direction(s) and summarizing the maximum variation in flow direction. *Multiple maps may be used. A copy of the map(s) from Section H (form 4400-245) may be used.*

√ A table summarizing all groundwater elevations, with dates, and top and bottom elevations of well screens. *(Wells are to be referenced to national geodetic survey datum, as per NR 141.065(2)).*

NA Graphs and statistical analyses which demonstrate the dynamics of the groundwater plume, for sites requesting closure using natural attenuation that meet the criteria s. NR 726.05(2)(b) or of s. NR 746 (permeable soils). *Refer to WDNR publication RR-614 for guidance.*

NA Geologic cross-sections showing extent of residual soil and/or groundwater contamination, as applicable. *A copy of the cross-section(s) from Section H, (form 4400-245) may be used.*

INFORMATION NEEDED:

1. Extent of Contamination Defined? **x** Y _____N _____N/A
2. Remedial Action Completed **x** Y _____N _____N/A
   Brief Description of Remedial Action Taken:
   Following the May 2006 excavation which included the removal of MW-1B were the concentration of 1,2-dichloroethane was reported above NR140 enforcement standards, no groundwater impacts above enforcement standards are reported.
3. Depth(s) to Groundwater **ranged from 3.76 to 8.12 feet below land surface**
   Flow Direction(s): **east, southeast, and south**

5. Lab Analyses? **x** Y _____N
   1 to 3 # of Sample Rounds
   18 # of Sampling Points
   11 # NR 141 Monitoring Wells Sampled
   8 # Temporary GW Sampling Points Sampled **(data not evaluated due high turbidity which biases data)**
   0 # Recovery Sumps Sampled
   0 # Municipal Wells Sampled
   0 # Private Wells Sampled
6. Was DNR notified of substances in groundwater without standards? _____Y _____ N **x** N/A
   If yes, how many? _____ What substances? _____
7. Preventive Action Limit currently exceeded? _____Y **x** N If yes, identify location(s)
   A concentration of 11 micrograms per kilogram (µg/L) for 1,2-dichloroethane was reported above NR140 preventive action limit at MW-1B. However, this well and surrounding soil were excavated in May 2006 to remove the source of the 1,2-dichloroethane.
8. Enforcement Standard currently exceeded? _____Y **x** N If yes, identify location(s)
   A concentration of 11 micrograms per kilogram (µg/L) for 1,2-dichloroethane was reported above NR140 enforcement standard at MW-1B. However, this well and surrounding soil were excavated in May 2006 to remove the source of the 1,2-dichloroethane.

WDNR BRRTS CASE # 02-41-543660 and 02-41-543659 WDNR SITE NAME: Properties No. 102 and 113 (Former Pressed Steel Tank Company, Parking Lot Property)

9. Measurable free product detected? _____Y **x** N Pre-remediation
   _____Y **x** N Post-remediation
10. Was free product remediated? _____ Y _____N **not applicable** Method: **not applicable**

    Purge water or free product-groundwater mixture disposal method? **Purge water was disposed of in the sanitary sewer in accordance with a Milwaukee Metropolitan District Permit.**
11. Potable wells within 1200 feet of site? **x** Y_____N

    Have they been sampled? _____Y **x** N
    Type (i.e. municipal, private, etc.)? **private** [NOTE: Include wells on *groundwater well location map*]
12. Has DNR been provided with **all** results of private well sampling? _____ Y _____N **not applicable**
13. Have well owners/occupants been notified of results? (*Sec. B Attachments*) _____ Y _____N **not applicable**
    (*Results also need to be sent to the DNR Water Supply Specialist)*
14. Are there any monitoring wells that have not been located for abandonment? _____Y **x** N
15. Identify the property address(es) where the missing well is located: **not applicable**

Section F. Other Contaminated Media Information:

ATTACHMENTS:

NA Table of analytical results for all contaminants for media other than soil or groundwater

INFORMATION NEEDED:

1. Have other media been impacted (either on-site or off-site e.g. sediment, utilities, air)? _____Y **x** N

   Briefly describe type and extent of **all** contamination found in media other than soil or groundwater:

   Not applicable
2. Remedial action completed? _____Y _____N **x** N/A

   Brief description of remedial action taken: _____
3. # of Post Remedial Sample Rounds: **not applicable**

   # of Sampling Points: **not applicable**

   Field Analyses? _____Y _____N

   Lab Analyses? _____Y _____N

Section G. Associated Site Closure Information:

ATTACHMENTS:

NA Construction documentation or as-built report for any constructed remedial action or portion of, or interim action specified in s. NR 724.02(1), in accordance with s. NR 724.15.

NA Maps and photos documenting the cap area, and/or integrity of the cap, with date.

NA Description of any soil performance standard cover system used, including a description of how it meets the requirement to be protective until residual contaminant concentrations no longer pose a threat to public health, safety, welfare or the environment, per s. NR 720.19(2), s. NR 722.09(2) and (3).

NA Maintenance plan associated with 292.12 land use control or for performance standard remedy. (per ss.NR 720.19(2) and 724.13(2))

WDNR BRRTS CASE # 02-41-543660 and 02-41-543659 WDNR SITE NAME: Properties No. 102 and 113 (Former Pressed Steel Tank Company, Parking Lot Property)

INFORMATION NEEDED:

1. Enforcement actions closed out? _____Y _____N **x** N/A
2. Permits closed out? _____Y _____N **x** N/A
3. Describe how the following pathways are protected:
   a) Direct Contact Pathway:

   One concentration of diesel range organics remains onsite at AGMSB-9 at 679 mg/kg from 2 to 4 feet bls. This boring is located under a asphalt parking space. The entire Site will be placed on the soil GIS registry to notify future property owners.

   b) Groundwater:

   There are no groundwater concentrations reported above NR140 enforcement standards onsite. The only exceedances was at MW-1B for 1,2-dichloroethane. However, this well and surrounding soil were excavated in May 2006 to remove the source of impacts from a gasoline UST.

   c) Other:

Section H. Required GIS Registry Information: Use form 4400-245, GIS Registry Checklist, and form 4400-246, Impacted Off-Source Property Information. Submit these forms and their attachments with this closure request form.

WDNR BRRTS CASE # 02-41-543660 and 02-41-543659 WDNR SITE NAME: Properties No. 102 and 113 (Former Pressed Steel Tank Company, Parking Lot Property)

I certify that, to the best of my knowledge, the information presented on and attached to this form is true and accurate. This recommendation for case closure is based upon all available data as of July 17, 2009. I have read the Case Closure Request Form instructions and all required information has been included.

Section A

Case History and Closure Pathway Selected

A brief site summary including results of all investigative activities, interim and remedial actions taken, a description of any residual soil and/or groundwater contamination and their locations, a description of any other media affected, and a description of how actual and potential impacts to receptors have been addressed.

Site Background

Site Location and Description

Properties No. 102 and 113 were located at 1441 S 65th Street and 1452 S 66th Street, respectively. Properties No. 102 and 113 were part of the former Pressed Steel Tank Company (PST) and were later collectively referred to as the Parking Lot Property ("Site"). ARCADIS is requesting closure of the Parking Lot Property, formerly known as Properties No. 102 and 113.

The former PST consisted of two properties including the Operating Facility and Parking Lot Property. The Operating Facility consisted of a manufacturing facility and offices west of South 66th Street between West Greenfield Avenue, West National Avenue, and to the east of an inactive Chicago & Northwest Railroad right-of-way. The Parking Lot Property is located east of South 66th Street between West Greenfield Avenue, West National Avenue, and South 65th Street. This property formerly consisted of a mix of residential and commercial properties.

These properties are located in the northwest one-quarter of the northeast one-quarter of U.S. Public Land Survey Section No. 3, Township 6 North, Range 21 East, City of West Allis, Milwaukee County, Wisconsin. The location of the subject site is shown on Figure 1.

Site Pre-Redevelopment

The Parking Lot Property formerly included the PST automotive garage, PST storage building, Bennett's Tavern, the PST Tavern, residential dwellings, and parking lots. The parking lots were either gravel or paved with bituminous concrete. The PST automotive garage consisted of a concrete block structure and was used to store privately owned automobiles. The pre-redevelopment site layout is shown on Figure 2.

Site Redevelopment

The Six Points/Farmers Market Redevelopment includes the PST Parking Lot Property and PST Operating Facility and the "700 Properties" which include those properties located south of the Operating Facility and National Avenue and east of the railroad line that crosses National Avenue. The Site was razed and has been redeveloped to include four condominiums and a community building. The redevelopment site layout is shown on Figure 3.

Investigation Activities

Soil and groundwater investigation activities were conducted at the Site between 1999 and 2006. The soil investigation included the advancement of 44 soil borings. Soil samples were collected and submitted for laboratory analyses including 67 samples for petroleum volatile organic compounds (PVOCs) or volatile organic compounds (VOCs); 26 samples for diesel range organics (DRO); 4 samples for gasoline range organics (GRO); 33 samples for polycyclic aromatic hydrocarbons (PAHs); 15 samples for lead; and 5 samples for polychlorinated biphenyls (PCBs). The groundwater investigation Included the installation of nine monitoring wells. Groundwater samples were collected and submitted for laboratory analyses including VOCs, PAHs, and dissolved metals.

A Phase I Environmental Site Assessment (ESA) was conducted by ARCADIS in 1999. ARCADIS conducted a site investigation to address recognized environmental conditions (RECs) at the Site. The results were included in the Site Investigation/Remedial Action Plan (SI/RAP) dated April 2001 and in a Remedial Action Plan Update dated November 2005. Two RECs were identified during the Phase I ESA and include:

- The presence of a hydraulic hoist within the western portion of the PST automotive garage on the Parking Lot Property.

- The former 1,000-gallon gasoline UST located adjacent to the northern exterior of the existing automotive garage on the Parking Lot Property. The WDNR issued closure for this former UST in a letter dated August 27, 1990.

Hydraulic Hoist

The former Pressed Steel Tank automotive garage consisted of a concrete block structure and was used to store privately owned automobiles. An inactive hydraulic hoist was located in the western portion of the garage. During the Phase I ESA no staining was observed to be associated with this hydraulic hoist. Four soil borings (SB8 through SB11) were advanced surrounding the hydraulic hoist by TEMCO in 2003. Soil samples were collected and submitted for laboratory analysis including diesel range organics (DRO), volatile organic compounds (VOCs), and polycyclic aromatic hydrocarbons (PAHs). The analytical results were reported below laboratory detection limits or below NR720 residual contaminant levels (RCLs).

Underground Storage Tank

A 1,000-gallon gasoline underground storage tank (UST) was removed from the northwest corner of the automotive garage on October 27, 1989 (Figure 2). During the excavation, soil samples were screened with a photo ionization detector (PID) and soils were excavated to remove impacted soils. The tank pit was excavated to the extent practicable, to the limits of the property, to physical barriers and to the maximum depth of soils accessible to the subcontractor.

In April 1990, three soil borings were advanced and sampled and then converted to monitoring wells. The wells and borings were installed as MW-1B, MW-2B, and MW-3B. The locations are presented on Figure 2. The analytical results indicated the presence of total petroleum hydrocarbons at a concentration of 16 parts per million. No benzene, ethylbenzene, toluene, or xylenes (BETX) were detected in the groundwater samples. The WDNR issued closure for this UST in a letter dated August 27, 1990.

In April 2003, Soil Borings SB-5, SB-6, and SB-7 were advanced near the location of the former UST (Figure 2). Diesel range organics were reported from 6 to 7 feet below land surface (bls) above NR720 residual contaminant level (RCL) of 250 milligrams per kilogram (mg/kg) at 260 mg/kg. Benzene, ethylbenzene, and xylenes were reported above NR720 RCLs from depths ranging from 6 to 11 feet bls. A concentration of 1,2-dichloroethane was also detected above NR140 enforcement standards at MW-1B.

Remedial Activities

In May 2006, ARCADIS supervised the excavation and onsite staging of impacted soil where the former UST was located. The excavation was centered on the location of Soil Boring SB-5 where NR720 RCLs were exceeded for DRO, benzene, ethylbenzene, and xylenes. The excavation also included the removal of MW-1B, where a concentration of 1,2-dichloroethane was reported above NR140 enforcement standards. The excavation limits measured approximately 12 by 12 by 12 feet deep. The excavation limits are presented on Figure 6. Soil sidewall confirmation samples were collected and submitted for laboratory analysis of petroleum volatile organic compounds (PVOCs) and lead. Soil laboratory report attached. All PVOC concentrations were reported below laboratory detection limits and the lead concentrations were reported below the NR720 non-industrial RCL. On June 8, 2006, the staged soil (approximately 129.76 tons) was loaded and transported offsite for disposal at Veolia Emerald Park Landfill, in Muskego, Wisconsin.

Section B
Receptor Summary

Risks to Human Health, Safety, Welfare and the Environment

In accordance with NR 726, ARCADIS evaluated whether the remaining constituent levels pose a threat to public health, safety or welfare, or the environment. Although addressed in the WDNR guidance document entitled "*Interim Guidance for Selection of Natural Attenuation for Groundwater Restoration and Case Closure Under Section NR 726.05(2)(b),*" the WDNR has not developed a standard for evaluating the groundwater closure criteria associated with risk to human health, safety, welfare, and the environment. ARCADIS utilized the procedures outlined in the American Society for Testing and Materials (ASTM) document entitled "*Emergency Standard Guide for Risk-Based Corrective Action Applied at Petroleum Release Sites.*" ARCADIS has found the ASTM document useful in evaluating risk associated with residual soil and groundwater impacts.

ARCADIS utilized the "*Exposure Scenario Evaluation Flowchart*" from the ASTM document to identify potential exposure pathways and receptors. A copy of the ASTM flowchart is attached. Secondary sources include impacted soil. Although the secondary source have been remediated, limited volumes of impacted soil remain. The primary exposure pathways associated with this secondary source includes soil ingestion through direct contact. This pathway was further evaluated to identify potential risks.

Direct Contact Pathway: Direct contact risks are generally associated with soil impacts present at between ground surface and 4 feet below ground surface and from excavated soil encountered during construction activities. A soil concentration of diesel range organics was identified during the Site investigation at AGMSB-9 at 679 milligrams per kilogram (mg/kg). This boring is located under a asphalt parking space onsite. The Site will be placed on the Wisconsin Department of Natural Resources Geographic Information System Registry for Closed Sites to address the direct contact pathway.

Drinking Water Supply: Several private water supply wells were identified within 1,200-foot radius of the Site (Figure 1). However, since there are no groundwater impacts reported above NR140 at the Site (MW-1B was excavated) and municipal water is supplied to the residences and businesses in the City of West Allis, there is no threat to drinking water supplies.

Utility Corridors: Groundwater impacts were only reported at one location (MW-1B) above the NR140 enforcement standard. An excavation was completed in May 2006 to remove this well and surrounding source material. Soil sidewall confirmation samples collected for petroleum volatile organic compounds (PVOC) and lead were reported below laboratory detection limits and NR720 non-industrial residual contaminant levels (RCLs), respectively. Based on the removal of the well location, source material, and absence of impacted soil, utility corridors do not pose a threat to the migration of impacts offsite.

Endangered or Threatened Species: There are no endangered or threatened species identified in the immediate vicinity to the Site.

ARCADIS

Table 3. Benzo(a)pyrene Equivalent Residual Contaminant Level Calculations and Results, Former Pressed Steel Tank Company, Parking Lot Property, West Allis, Wisconsin.

BOLD	Concentration exceeds the BaP_{equiv} Industrial Direct Contact RCL of 3,900 µg/kg or 3.9 mg/kg.
Italic	Concentrations equal to one-half the detection limit were used in the calculations where sample results were reported below laboratory detection limits.
BaP_{equiv}	Calculated benzo(a)pyrene equivalent concentration.
µg/kg	Micrograms per kilogram.

ARCADIS

Risk-Based Algorithms for Soil Ingestion

The default exposure factors used for direct ingestion of contaminated soil are those specified in s. NR 720.19(5), Wis. Adm. Code.
The value for non-industrial and industrial exposure are the same as the default values used by U.S. EPA in the soil screening in level methodology (U.S. EPA 1996). (1)

Algorithm for Ingestion of Carcinogenic Contaminants in Non-Industrial Soil

Target Cancer Risk Level, TR (unitless)	1.00E-07		
Combined Target Cancer Risk Level for *in situ* contaminated soil	1.00E-05	Average Body Weight from, Age 1-6, BWc (kg)	15
Averaging Time, AT (yr)	70	Ingestion Rate of Soil Age 7-31, IRa (mg/d)	100
Exposure Frequency, EF (d/yr)	350	Exposure Duration from Age 7-31, EDa (yr)	24
Age-adjusted Soil Ingestion Factor, IFs (mg*yr/kg*d)	34	Average Adult Body Weight, BWa (kg)	70
Ingestion Rate of Soil Age 1-6, IRc (mg/d)	200		

Benzo(a)pyrene equivalent concentration - RCL ingestion, all PAHs detected, non-industrial

$$\text{RCL} = \frac{\text{TR} \times \text{AT} \times 365\ \text{day/year}}{\text{SFo} \times 10^{-6}\ \text{kg/mg} \times \text{EF} \times \text{IFs}}$$

$$\text{RCL} = \frac{(1*10^{-5})*70*365}{(7.3*10^{-6})*350*114} = \frac{0.2555}{0.29127} = \textbf{0.88 mg/kg or 880 µg/kg}$$

Algorithm for Ingestion of Carcinogenic Contaminants in Industrial Soil

Target Cancer Risk Level, TR (unitless)	1.00E-06	Exposure Duration, ED (yr)	25
Combined Target Cancer Risk Level for *in situ* contaminated soil	1.00E-05	Average Adult Body Weight, BWa (kg)	70
Averaging Time, AT (yr)	70		
Exposure Frequency, EF (d/yr)	250		
Ingestion Rate of Soil for Adult, IRa (mg/d)	100		

Benzo(a)pyrene equivalent concentration - RCL ingestion, all PAHs detected, industrial

$$\text{RCL} = \frac{\text{TR} \times \text{BWa} \times \text{AT} \times 365\ \text{day/year}}{\text{SFo} \times 10^{-6}\ \text{kg/mg} \times \text{EF} \times \text{ED} \times \text{IRa}}$$

$$\text{RCL} = \frac{(1*10^{\wedge -5})*70*70*70*365}{(7.3*10^{\wedge -6})*250*25*100} = \frac{17.885}{4.5625} = \textbf{3.9 mg/kg or 3,900 µg/kg}$$

Footnotes on Page 4.

Table 3. Benzo(a)pyrene Equivalent Residual Contaminant Level Calculations and Results, Former Pressed Steel Tank Company, Parking Lot Property, West Allis, Wisconsin.

BOLD	Concentration exceeds the BaP_{equiv} Industrial Direct Contact RCL of 3,900 µg/kg or 3.9 mg/kg.
Italic	Concentrations equal to one-half the detection limit were used in the calculations where sample results were reported below laboratory detection limits.
BaP_{equiv}	Calculated benzo(a)pyrene equivalent concentration.
µg/kg	Micrograms per kilogram.

ARCADIS

Table 3. Benzo(a)pyrene Equivalent Residual Contaminant Level Calculations and Results, Former Pressed Steel Company Parking Lot Property, West Allis, Wisconsin.

Risk-Based Algorithms for Soil Ingestion

The default exposure factors used for direct ingestion of contaminated soil are those specified in s. NR 720.19(5), Wis. Adm. Code.
The value for non-industrial and industrial exposure are the same as the default values used by U.S. EPA in the soil screening in level methodology (U.S. EPA 1996). (1)

Algorithm for Ingestion of Carcinogenic Contaminants in Non-Industrial Soil

Target Cancer Risk Level, TR (unitless)	1.00E-07		
Combined Target Cancer Risk Level for *in situ* contaminated soil	1.00E-05	Average Body Weight from, Age 1-6, BWc (kg)	15
Averaging Time, AT (yr)	70	Ingestion Rate of Soil Age 7-31, IRa (mg/d)	100
Exposure Frequency, EF (d/yr)	350	Exposure Duration from Age 7-31, EDa (yr)	24
Age-adjusted Soil Ingestion Factor, IFs (mg*yr/kg*d)	34	Average Adult Body Weight, BWa (kg)	70
Ingestion Rate of Soil Age 1-6, IRc (mg/d)	200		

Benzo(a)pyrene equivalent concentration - RCL ingestion, all PAHs detected, non-industrial

$$\text{RCL} = \frac{\text{TR} \times \text{AT} \times 365\ \text{day/year}}{\text{SFo} \times 10^{-6}\ \text{kg/mg} \times \text{EF} \times \text{IFs}}$$

$$\text{RCL} = \frac{(1*10^{-5})*70*365}{(7.3*10^{-6})*350*114} = \frac{0.2555}{0.29127}$$

= 0.88 mg/kg or 880 µg/kg

Algorithm for Ingestion of Carcinogenic Contaminants in Industrial Soil

Target Cancer Risk Level, TR (unitless)	1.00E-06	Exposure Duration, ED (yr)	25
Combined Target Cancer Risk Level for *in situ* contaminated soil	1.00E-05	Average Adult Body Weight, BWa (kg)	70
Averaging Time, AT (yr)	70		
Exposure Frequency, EF (d/yr)	250		
Ingestion Rate of Soil for Adult, IRa (mg/d)	100		

Benzo(a)pyrene equivalent concentration - RCL ingestion, all PAHs detected, industrial

$$\text{RCL} = \frac{\text{TR} \times \text{BWa} \times \text{AT} \times 365\ \text{day/year}}{\text{SFo} \times 10^{-6}\ \text{kg/mg} \times \text{EF} \times \text{ED} \times \text{IRa}}$$

$$\text{RCL} = \frac{(1*10^{\wedge -5})*70*70*70*365}{(7.3*10^{\wedge -6})*250*25*100} = \frac{17.885}{4.5625}$$

= 3.9 mg/kg or 3,900 µg/kg

Introduction

This *Pre-Design Engineering Report* has been prepared for the Pressed Steel Tank (PST) Company - Parking Lot Property ("Parking Lot Property") located in West Allis, Wisconsin. The Parking Lot Property is part of the Six Points/Farmers Market Redevelopment Area. ARCADIS was retained to characterize and quantify the amount of fill and native soil that will require management and offsite disposal as part of the redevelopment. Also included in this Report is an estimate of the volume of material that could be reconsolidated at the Lime Pit Property located in West Allis, Wisconsin.

Background

Site Location and Description

The PST Company is located in the northwest one-quarter of the northeast one-quarter of U.S. Public Land Survey Section No. 3, Township 6 North, Range 21 East, City of West Allis, Milwaukee County, Wisconsin. The location of the PST Company is shown on Figure 1.

The PST Company consists of two properties including the Operating Facility and Parking Lot Property.. The Operating Facility consists of a manufacturing facility and offices west of South 66th Street between West Greenfield Avenue, West National Avenue, and to the east of an inactive Chicago & Northwest Railroad right-of-way. The Parking Lot Property is located east of South 66th Street between West Greenfield Avenue, West National Avenue, and South 65th Street. Figure 2 is a site layout.

For the purposes of this report, the Parking Lot Property has been further divided into two areas. Area 1 is associated with PST operations and includes PST automotive garage, PST storage building, and parking lot. Area 2 refers to the commercial and residential parcels including the areas outside the PST garage/storage buildings including Bennett's Tavern, the PST Tavern, residential dwellings, and parking lots. The parking lots are either gravel or paved with bituminous concrete. The buildings have subsequently been razed. The PST automotive garage consisted of a concrete block structure and was used to store privately owned automobiles.

Redevelopment Overview

The Six Points/Farmers Market Redevelopment includes the PST Company Parking Lot Property and PST Company Operating Facility and the "700 Properties" which

include those properties located south of the Operating Facility and National Avenue and east of the railroad line that crosses National Avenue. The Six Points/Farmers Market Redevelopment will occur in three phases that coincide with property purchase as follows:

- Phase I: The "700 Properties."
- Phase II: The Parking Lot Property.
- Phase III: The Operating Facility.

The sequence of redevelopment follows:
Phase II → Phase I → Phase III

The three properties were formerly used for a combination of residential, commercial, and industrial land use. Soil and groundwater contamination have been identified on all three properties. The extent of soil and groundwater contamination has been investigated and Remedial Action Plans (RAPs) have been prepared for the 700 Properties and the Parking Lot Property sites. The 700 Properties RAP was approved by the Wisconsin Department of Natural Resources (WDNR) in a letter dated December 7, 2005. The Parking Lot Property RAP Update is under review by the WDNR.

With the exception of a relatively small quantity of "highly contaminated" soils that will require excavation and off-site disposal and/or treatment, the contaminants in soil are generally at low-level concentrations and do not require active treatment. A significant portion of the contaminated soils is related to residual contaminants that were present in fill materials that were historically brought to the properties for modifying site grades. The low-level contaminated soils can effectively be managed during redevelopment by reconsolidation of these soils onsite and reliance on engineered surface barriers (i.e., concrete floor slabs, asphalt parking lots) to prevent any future exposure to the low-level residual contamination. However, the design of the development features for the Phase II Property does not allow for efficient reconsolidation of any excavated contaminated soils.

Objectives

The goals of the field investigation and pre-design engineering study include:

- Further define the chemical characterization of fill material and native soil across the Parking Lot Property that will be excavated to facilitate construction of the proposed development.

- Categorize and quantify the volumes of fill material and native soil for disposal.

- Conduct a preliminary engineering analysis to determine the potential capacity of material that can be consolidated at the Lime Pit Property.

Field Investigation

The field investigation was completed on the Parking Lot Property by ARCADIS and Kitson Environmental Services in February 2006. Twenty soil borings (Soil Borings SB100 through SB119) were advanced to determine the extent and thickness of fill material and chemically characterize the fill material and native soil. The soil borings were advance to depths ranging from 8 to 12 feet below the land surface (ft bls) within the limits of former building foundations, as well as within the limits of proposed building foundations, parking areas, and ramps for underground parking. The soil boring locations are illustrated on Figure 3.

Health and Safety/Utility Locate

ARCADIS has previously conducted onsite field investigation activities and completed a site-specific Health and Safety Plan (HASP) to be used for this investigation. The site-specific HASP identified health and safety requirements including site control, personal protective equipment, constituents of concern, and emergency contact information.

Three days prior to the start of drilling, Digger's Hotline was contacted to conduct the demarcation of underground utilities. In addition, a private utility locator (Private Lines) was subcontracted to mark underground utilities.

Drilling and Soil Sampling Procedures

A Geoprobe™ direct-push drill rig was used to advance the soil borings. Soil samples were collected by driving a steel sampling spoon (sampler) with acetate liners to 4 feet using a hydraulic ram and hammer. Once the sampler reaches 4 feet, the sampler was opened by removing a stop pin in the sampler. The sampler was driven an

additional 4 feet to push a soil sample into the sampler, preserving the sample in a 4-foot acetate liner inside the sampler.

After collection, the acetate liner was opened and the soil sample was divided into 2-foot intervals, with the exception of the first and last 1-foot interval. Companion sampling was completed by collecting one samples of soil from each sampling interval, one sample of soil from the fill material (discarding the first foot), and one sample of soil from the native soil. The soil samples were placed into separate resealable plastic bags. The companion samples collected from each sampling interval were used for field screening for the presence of total ionizable volatile organic compounds (VOC) vapors with a calibrated flame ionization detector (FID). The screening samples were warmed and the headspace FID reading of the soil was taken by inserting the probe end of the FID into the plastic bag through a punctured hole. The screened samples were discarded. The companion samples from the fill material and native soil were stored on ice in a cooler and used for preparing samples for analytical testing.

An ARCADIS geologist supervised the drilling activities and described the condition and engineering properties of the soil. Soil boring logs, including descriptions and field screening results are included in Appendix A. Upon completion of the logging and sampling activities, the soil borings were abandoned in accordance with s. NR 141 Wis. Adm. Code using granular bentonite. Borehole abandonment forms are included in Appendix B.

Soil Analytical Parameters

One composite soil sample was collected from a depth of 1 ft bls to the fill material/native soil contact at each of the 20 boring locations. A subset of 12 composite soil samples was collected from the base of the fill material to a maximum depth of 12 ft bls. Soil samples were submitted for analysis from the unscreened companion samples.

The soil samples were submitted for laboratory analysis to Analytical Process Laboratories, Inc. of Milwaukee, Wisconsin and Test America, Inc. of Watertown, Wisconsin. Soil samples collected from the Parking Lot Property located within the approximate limits of Area 1 were submitted for analysis of VOCs, polycyclic aromatic hydrocarbons (PAHs), and total lead. Soil samples collected from Area 2 were submitted for analysis of petroleum volatile organic compounds (PVOCs) and PAHs. Areas 1 and 2 are depicted on Figure 4. Soil laboratory analytical reports and chain-of-custody forms are included in Appendix C.

Management of Investigative-Derived Waste

Soil cuttings generated during the investigation were placed into a secure 55-gallon steel drum. The drum was labeled with the contents, dates work was completed, and ARCADIS contact information. The drum was stored on-site pending disposal.

Soil Regulatory Criteria

Regulatory Criteria

The WDNR has established generic soil Residual Contaminant Levels (RCLs) for five VOCs and four metals in ch. NR 720, Wis. Admin. code. Generic soil RCLs for the VOCs benzene, 1,2-dichloroethane, ethylbenzene, toluene, and xylene were established based on protection of groundwater. A second set of VOC soil criteria has also been established under ch NR 746, Wis. admin. code for certain petroleum VOC constituents, but these standards apply only to impacts that were caused by releases from petroleum underground storage tanks. The ch NR 746, Wis. admin. code soil criteria are based on soil concentrations that are indicative of potential free phase product. Soil RCL for lead has been established based on risk to human health from direct contact exposure. The direct contact RCL for lead is sub-divided into industrial and non-industrial based on land use.

In addition, industrial and non-industrial direct contact RCLs, and RCLs based on protection of groundwater, have been proposed for several PAHs compounds in a WDNR guidance document (WDNR, 1997). The data was compared to these soil standards.

Geologic Conditions

In general, three subsurface units were encountered during the subsurface investigation including an approximate 1 foot of surficial cover of asphalt, sandy gravel or topsoil, underlain by fill material and glacially derived clay till. Bedrock was not encountered.

Fill Material

The limits of the fill material were determined based on a collective review of the soil's variable characteristics including grain size distribution, color, density, consistency, structure, and presences of construction debris. The thickness of the fill material is

presented on Figure 4. The fill consists of variable amounts of silt and sand with and trace gravel in a clay matrix. Heavy to light mottling was observed in nearly all borings indicating a fluctuating water table. Based on the amount of silt and fine sand present, the fill density was generally very soft to very stiff and structurally crumbly to exhibiting low plasticity. Wood, nails, cinders, and broken asphalt pieces were also observed several of the borings. This material was observed in variable portions in Area 2 Soil Borings SB101, SB101, and SB104 primarily along West Greenfield Avenue where the restaurants and taverns were located, and SB112 where a former garage was located. Based on the wide distribution of the grain sizes, inconsistent density and structurally soil properties, muddled color, and presence of construction debris, the fill material was determined to extend a depth of 1 ft bls to a maximum depth of 8 ft bls.

Native Soil

The native soil observed at the Site is clay till consisting of uniform, hard, no to low plastic clay with trace subangular to subrounded gravel (likely dolomitic). The clay till at the Site is generally an oxidized dark yellowish brown (10YR 4/4) to brown (10YR 5/3). However, unoxidized clay till was also observed at the Site as dark grayish brown (10YR 4/2). Interbedded silt and clay and discontinuous sand lenses were also observed in select borings.

The native soil at the Site and surrounding area consists of low energy, glacial-derived unconsolidated deposits overlying dolomite bedrock (WGNHS, 1976). The Site appears to be located within a north-south trending lateral moraine clay till. The interbedded silt and clay and discontinuous sand lenses where likely channel or braided stream deposits. The soil at the Site are part of the Oak Creek Formation, which was deposited by the Lake Michigan Lobe during the Wisconsin Glaciation period, approximately 13,200 to 14,500 years ago as it moved west-southwest across southeast Wisconsin.

Soil Field Screening and Analytical Results

Soil investigation activities, consisting of the advancement of 20 soil borings, have been completed to evaluate the surface soil conditions at the Site. In addition to the soil analytical results from this investigation, soil analytical results from 2001 collected by ARCADIS and 2004 collected by The Environmental Management Company (TEMCO) were compared to the regulatory criteria presented earlier in this report. Soil field screening results are summarized in Table 1. Soil VOC, PAH, and lead analytical results are summarized in Table 2. Soil laboratory analytical reports and chain-of-

custody forms are included in Appendix C. Historical soil analytical results from ARCADIS and TEMCO are presented in Appendix D.

Field Screening Results

Soil samples were collected from the soil borings and field screened for the presence of total ionizable VOCs. Field screening results are summarized in Table 1. Generally, the FID readings were consistent in the fill material and native soil in respective to the individual borings. FID readings were detected from 0 to 9.6 parts-per-million instrument units, with the exception of readings in the fill material from Soil Borings SB109, SB113, and SB115 where FID readings were detected at 14, 15.3, and 28.4 ppm, respectively. These slightly elevated FID readings correlate to minimal soil staining observed in the borings from a depth of approximately 1 to 3.75 ft bls. There are no chemical spills or releases known to have occurred at these areas.

PAHs Analytical Results

Fill Material

Twenty soil samples were collected from the fill material at the Parking Lot Property and submitted for analysis of PAHs. Soil PAH analytical results are summarized in Table 2. The extent of contamination in the fill material is illustrated on Figure 5. One or more PAHs were reported above the non-industrial RCL in Soil Borings SB101 through SB104, SB107, and SB116. Additionally, benzo(a)pyrene was reported at Soil Borings SB103 and SB104 above its industrial RCL of 0.39 milligrams per kilogram (mg/kg) at 1.1 mg/kg and 0.39 mg/kg, respectively. The extent of the soil contamination was primarily detected in Area 2 where the former restaurants and taverns along West Greenfield Avenue were located. However, a limited area of soil contamination was detected in the parking lot in Area 1 along West National Avenue.

Native Soil

Twelve soil samples were collected from the native soil at the Parking Lot Property and submitted for analysis of PAHs. Soil PAH analytical results are summarized in Table 2. The extent of soil contamination is illustrated on Figure 6. One or more PAHs were reported above the non-industrial RCLs in Soil Borings SB5, SB110, and SB116. Additionally, benzo(a)pyrene was reported at Soil Boring SB118 above its industrial RCL of 0.39 mg/kg at 0.52 mg/kg. The soil contamination was detected at the former

1,000-gallon gasoline underground storage tank (UST), north of the former PST storage building, and in the parking lot south of the former PST automotive garage.

VOCs Analytical Results

Fill Material

Twenty soil samples were collected from the fill material at the Parking Lot Property and submitted for analysis of VOCs or PVOCs. All soil sample results from this and historical investigations were reported below laboratory detection limits or below NR 720 RCLs. Soil VOC analytical results are summarized in Table 2.

Native Soil

Twelve soil samples were collected from the native soil at the Parking Lot Property and submitted for analysis of VOCs or PVOCs. All soil analytical results from this investigation were reported below laboratory detection limits. Soil VOC analytical results are summarized in Table 2. However, benzene, ethylbenzene, naphthalene, xylenes, and gasoline range organics concentrations were reported above NR 720 RCLs at Soil Boring SB5 completed in 2004 by TEMCO. The soil impacts appear limited to the proximity to the former 1,000-gallon gasoline UST cavity. Figure 6 historical analytical results are presented in Appendix D.

Total Lead

Fill Material

Nine soil samples were collected from the Parking Lot Property located within the approximate limits of Area 1 and submitted for lead analysis. All soil sample results were reported below laboratory detection limits or below NR 720 non-industrial RCL of 50 mg/kg. Soil lead results are summarized in Table 3.

Native Soil

Six soil samples were collected from the Parking Lot Property located within the approximate limits of Area 1 and Area 2 and submitted for lead analysis. All soil sample results were reported below laboratory detection limits. Soil lead results are summarized in Table 3.

Volume Estimates

Overall Earthwork Balance

Parking Lot Property

ARCADIS was provided with a construction cost estimate prepared by Landcraft Survey & Engineering, Inc. ("Landcraft") for the Parking Lot Property dated August 22, 2005. The estimate included earthwork quantities for the Parking Lot Property. Landcraft estimated a total of approximately 23,000 cubic yards of excess soil and surface materials (i.e., topsoil and asphalt pavement) would be generated at the Parking Lot Property due to the redevelopment activities.

ARCADIS performed a cut/fill balance using the current survey of the Parking Lot Property and the proposed topography of the site following redevelopment, and calculated that approximately 17,600 cubic yards of excess soil, including fill material and native soil, will be generated at the Parking Lot Property due to the redevelopment of the site.

Lime Pit Property

The Lime Pit Property is located in and owned by the city of West Allis. The general topography of the Lime Pit Property is undulatory and highly variable over short distances. The city of West Allis is in the early staged of planning redevelopment of the Lime Pit Property. The future use of the Lime Pit Property at this time is light industrial. However, the Lime Pit Property will require the importation of material to establish a uniform grade across the property.

The Lime Pit Property is relatively close to the Parking Lot Property. Therefore, the excess fill material at the Parking Lot Property could be reconsolidated at the Lime Pit Property (with WDNR approval). ARCADIS conducted a cut/fill balance at the Lime Pit Property using the Alta Survey and establishing a proposed site-wide ground elevation consistent with surrounding properties (727 feet above mean sea level). Then, ARCADIS calculated the volume of material required to be imported to create a uniform site grade. Approximately 36,000 cubic yards of soil may be accommodated at the Lime Pit Property. The Lime Pit Property is depicted on Figure 7.

Petroleum Contaminated Fill Material and Native Soil

There is approximately 700 to 900 cubic yards of petroleum impacted soil that remains on the Parking Lot Property. This petroleum contaminated soil contains benzene at concentrations above the ground protection RCL. Therefore, the 900 cubic yards of fill material and native soil is assumed to be load, transported, and disposed of at a landfill.

Fill Material Quantities and Disposal Estimate

ARCADIS reviewed the available soil boring analytical data in order to estimate the portion of the excess fill material that will qualify as either contaminated (landfill disposal or reconsolidation at Lime Pit Property) or clean fill material (no special disposal requirements). Based on available data, the following estimates were calculated:

Estimated quantity of fill material that will be generated during redevelopment of Parking Lot Property	13,000 cubic yards*
Estimated quantity of clean fill material (no special disposal requirements).	9,300 cubic yards
Estimated quantity of PAH-contaminated fill material (reconsolidation at Lime Pit Property)	3,700 cubic yards

* Volume includes the top 1-foot of surficial material including asphalt, concrete, base coarse material, and/or topsoil.

Native Soil Quantities and Disposal Estimate

ARCADIS reviewed the available soil boring analytical data in order to estimate the portion of the excess native soils that will qualify as qualify as either contaminated (non-hazardous special waste) or clean soil (no special disposal requirements). Based on available data, the following estimates were calculated:

Estimated quantity of native soil that will be generated during redevelopment of Parking Lot Property	3,700 cubic yards*
Estimated quantity of clean native soil (no special disposal requirements).	2,800 cubic yards
Estimated quantity of contaminated native soil (non-industrial RCL PAHs exceedances).	400 cubic yards

Estimated quantity of contaminated native soil (industrial RCL PAHs exceedances).	500 cubic yards

* Volume includes the top 1-foot of surficial material including asphalt, concrete, base coarse material, and/or topsoil.

Conclusions and Recommendations

The Parking Lot Property is part of the Six Points/Farmers Market Redevelopment Area which will require removal of approximately 17,600 cubic yards of the excess fill material and native soil. ARCADIS conclusions and recommendations are summarized in the following bulleted list:

- Approximately 900 cubic yards of petroleum contaminated fill material/native soil will require offsite disposal as a non-hazardous special waste.
- Approximately 13,000 cubic yards of excess fill material will be generated at the Parking Lot Property. Of this quantity, 9,300 cubic yards is clean and requires no special handling or disposal requirements. Approximately 3,700 cubic yards is impacted with PAHs and could be reconsolidated at the Lime Pit Property.
- Approximately 3,700 cubic yards of excess native soil will be generated at the Parking Lot Property. Of this quantity, 2,800 cubic yards is clean and requires no special handling or disposal requirements. Approximately 900 cubic yards is impacted with PAHs and will require management as a no-hazardous special waste.
- The volume of material to level the grade of the Lime Pit Property is estimated to be 36,000 cubic yards.

Subject: Review of the Request for Approval for Off-site Disposal of Contaminated Soil from the Six Points/Farmers Market Redevelopment Project Site at a Response Action Site (Lime Pit Property (aka Jays Fuel Oil, 1960 S 67th Place) [FID# 241222520 / BRRTS# 02-41-184802], West Allis, WI

Dear Mr. Stibal:

Your consultant, TEMCO, submitted a document entitled "Request for Approval for Off-site Disposal of Contaminated Soil from the Six Points/Farmers Market Redevelopment Project Site at a Response Action Site (Lime Pit Property), West Allis, WI" (Plan), dated February 5, 2008 to the Wisconsin Department of Natural Resources (WDNR). You have requested that the WDNR formally review the Plan.

The site is located in the City of West Allis, including the portion of West National Avenue from the intersection of 65th Street west to the rail crossing. It includes the area beneath the roadway and an eleven feet wide strip of land along the north side of the road. As described in the Plan, the site has several contaminants which exceed the residual contaminant levels (RCLs), including polycyclic aromatic hydrocarbons (PAHs) and arsenic. The Plan includes a proposal to manage the contaminated soils as described below.

- PAH contaminated soil may be taken to the Lime Pit property.
- Lead contaminated soil (all concentrations detected are below 100 mg/kg) may be taken to the Lime Pit property.
- Arsenic contaminated soil (all concentrations detected are below 10 mg/kg) may be taken to the Lime Pit property.

I have reviewed the Plan and spoken with your consultant regarding specific details of the Plan. Based on my review, the Plan is approved with the following conditions and limitations.

Based on my discussions with your consultant and information contained in the plan, it appears that the long term plan is to cover the contaminated soil that will be coming to the Lime Pit Property from the Six Points/Farmers Market Redevelopment Project Site, along with the contaminated soil that is already present at the Lime Pit Property, with a combination of buildings, pavement and clean fill when the property is developed.

Because this development activity will not be occurring in the next few months, any imported contaminated soil material shall be covered with a temporary cover, to limit erosion and dust, within 90 days of soil placement. An acceptable option would be construction of a vegetative cover, including a minimum of six inches of clean "rooting zone" material. If you wish to request approval of an alternate cover system, please contact me.

We appreciate your efforts to restore the environment at this site. If you have any questions or concerns regarding this letter, please contact me at (414) 263- 8541.

Sincerely,

Andrew F Boettcher
Hydrogeologist – RR/SER

Re: Request for Approval for Off-site Disposal of Contaminated Soil From The Six Points/Farmers Market Redevelopment Project Site At A Response Action Site (Lime Pit Property) ~ West Allis, Wisconsin

Dear Ms. Stovall:

On behalf of the City of West Allis Community Development Authority (CDA), THE ENVIRONMENTAL MANAGEMENT COMPANY LLC (TEMCO) requests WDNR approval to dispose contaminated soil fill to be excavated from the Six Points/Farmers Market Redevelopment Project Site at the Lime Pit property.

The portion of the Six Points/Farmers Market site which is the subject of this request is the portion of West National Avenue from the intersection of 65th Street west to the rail crossing. It includes the area beneath the roadway and an eleven (11) feet wide strip of land along the north side of the road. The Lime Pit property is located approximately 0.5 mile south of the Six Points/Farmers Market site and is bounded by the Union Pacific railroad trackbed on the north, the City of West Allis Fire Station #2 on the south, Becher Place on the east, and South 67th Place and St. Augustine Catholic Church and School on the west.

The above referenced WDNR approval is requested to facilitate widening and lowering the elevation of a section of West National Avenue, as well as realignment of several sections of sanitary and storm sewer lines. The surface grade of the roadway will be lowered as much as 2.5 feet below existing grade. An estimated maximum of 1,000 tons of soil fill contaminated with low levels of Polyaromatic Hydrocarbons (PAH) and arsenic may require disposal at the Lime Pit.

The Lime Pit property is currently being prepared for future light industrial redevelopment. The only soil contamination on the Lime Pit property which exceeds RCL's (recommended) are PAH compounds, which are widely distributed throughout the site. The highest PAH levels occur in shallow soil fill in the former lime slurry pit areas (southwestern corner of the site and the south eastern and eastern areas of the site).

The West Allis CDA seeks WDNR approval under WAC NR 718.13 to place the soil fill from the National Avenue site contaminated with low levels of PAH compounds and arsenic on the Lime Pit property in the former lime slurry pit areas. A summary of the contamination levels of soil which may be exported from the National Avenue site, together with the relevant analytical data table and site figures, is included in this submittal.

PHONE: (262) 675-6000 P. O. BOX 856 • CEDARBURG WI 53012 FAX: (262) 675-6170 OFFICE@TEMCO-LLC.COM

A summary of the distribution of contaminants in shallow soil at the National Avenue site follows:

- Volatile Organic Compounds (VOC) (reference Table 1). No VOC above RCL were detected in any of the samples collected from the 18 soil borings completed on the north and south sides of the subject section of West National Avenue. The only detection of VOC was a very low level detection of toluene in the soil sample collected from boring NA-10 at two to three feet bgs. The toluene detection may represent the northern edge of residual contamination associated with a historic service station believed to have been located on the south side of West National Avenue in the 1930's.

- Polyaromatic Hydrocarbons (reference Table 2 and Figures 2.1 and 2.2). PAH compounds were detected at only three (3) locations:

  - NA-12 at 6 to 8 feet bgs
  - NA-9 at 1 to 2 feet bgs
  - NA-4 at 3 to 4 feet bgs

  The PAH contaminant levels in these samples were very low, exceeding only the RCL for the Non-Industrial Direct Contact exposure pathway for a few PAH compounds.

- Metals (reference Table 3 and Figures 2.1 and 2.2).

  - Arsenic levels in shallow soil are generally low single-digit mg/kg levels typical of urban soils in southeastern Wisconsin. These levels are generally considered background values.

  - Lead levels in shallow site soil are well below 100 mg/kg at all sampling locations.

All soil borings were drilled, sampled, and logged to a depth of ten (10) feet bgs, which approximates the maximum depth of soil excavation planned in the road/utility redevelopment project. Soil conditions encountered in the borings were consistently one to three feet of gravelly clay fill underlying pavement and gravel base. Clean silty clay soil was encountered in all borings beneath the fill. No evidence of soil contamination, i.e. staining or odors, was encountered in any of the soil borings.

Also attached is a Lime Pit Property figure showing the area where the soil fill will be placed, spread, and compacted. The accompanying soil contaminant distribution figure and analytical data tables show the high levels of PAH compounds in the former lime slurry pit areas. The northeast corner of the site, which was a former lime slurry pit area, has been reserved from filling temporarily. The City of West Allis is planning to place high capacity sanitary and storm sewer trunk lines on the Lime Pit property along the north property boundary. Relevant information concerning soil and groundwater conditions at the Lime Pit Property is contained in the Site Investigation Report prepared and submitted to WDNR by TEMCO in March 2006.

TEMCO has evaluated this soil fill placement plan with the requirements of WAC NR 718.13 (2) through (9), and believes the plan conforms with all of the listed conditions.

Placement of contaminated soil fill from the National Avenue Redevelopment Project on the nearby Lime Pit site will be very beneficial to redevelopment of both properties. Excess soil from the National Avenue site represents a portion of the fill needed to level the Lime Pit site prior to redevelopment.

The Remedial Action Plan for the Lime Pit property will specify placement of a cap over areas containing PAH contaminants in the direct contact zone above recommended industrial RCL's. These areas include virtually all of the former lime slurry pit areas and small portions of the central, western and northern parts of the site. The site capping will likely take the form of industrial buildings, pavement above parking lots and walkways, and clay soil in landscape areas.

Please contact the undersigned with questions or if further information is needed. Thank you for your assistance in facilitating this important redevelopment project in the City of West Allis.

Sincerely,

THE ENVIRONMENTAL MANAGEMENT COMPANY LLC

Subject: Review of the Request for Approval of Off-site Disposal of Contaminated Soil from the Pressed Steel Tank Parking Lot Property [FID# 241793420 / BRRTS# 02-41-543660] at the Lime Pit Property [FID# 241222520 / BRRTS# 02-41-184802], West Allis, WI

Dear Mr. Stibal:

Your consultant, TEMCO, submitted a document entitled "Request for Approval of Off-site Disposal of Contaminated Soil from the Pressed Steel Tank Parking Lot Property at a Response Action Site (Lime Pit Property), West Allis, WI" (Plan), dated March 23, 2006. You have requested that the WDNR formally review the Plan and the required plan review fee was submitted.

I have reviewed the Plan and spoken with your consultant regarding specific details of the Plan. Based on my review, the Plan is approved with the following conditions.

Based on my discussions with your consultant and information contained in the plan, it appears that the long term plan is to cover the contaminated soil that will be coming to the Lime Pit Property from the Pressed Steel Tank Parking Lot Property, along with the contaminated soil that is already present at the Lime Pit Property, with a combination of buildings, pavement and clean fill when the property is developed. Because this development activity will not be occurring in the next few months, any imported contaminated soil material shall be covered with a temporary cover, to limit erosion and dust, within 90 days of soil placement. An acceptable option would be construction of a vegetative cover, including a minimum of six inches of clean "rooting zone" material. If you wish to request approval of an alternate cover system, please contact me.

We appreciate your efforts to restore the environment at this site. If you have any questions or concerns regarding this letter, please contact me at (414) 263- 8541.

Sincerely,

Andrew F Boettcher

RE: Request for Approval for Off-site Disposal of Contaminated Soil From The Pressed Steel Tank Parking Lot Property At A Response Action Site (Lime Pit Property) West Allis, Wisconsin

Dear Ms. Stovall:

On behalf of the City of West Allis Community Development Authority (CDA), THE ENVIRONMENTAL MANAGEMENT COMPANY LLC (TEMCO) requests WDNR approval to dispose contaminated soil fill to be excavated from the Pressed Steel Tank Company Parking Lot property at the Lime Pit property. Please find attached a check for the $500.00 review fee applicable to the requested review.

The PST Parking Lot property is located in West Allis, Wisconsin and is bounded by West Greenfield Avenue on the north, West National Avenue on the south, South 65th Street on the east, and South 66th Street on the west. The Lime Pit property is located approximately 0.5 mile south of the PST Parking Lot property and is bounded by the Union Pacific railroad trackbed on the north, the City of West Allis Fire Station #2 on the south, Becher Place on the east, and South 67th Place and St. Augustine Catholic Church and School on the west.

Both the PST Parking Lot property and the Lime Pit property are owned by the City of West Allis CDA. The above referenced WDNR approval is requested to facilitate redevelopment of the PST Parking Lot property, which requires net export of on-site soil to accommodate underground parking facilities. Approximately 3,700 cubic yards of soil fill contaminated with low levels of PAH will require disposal at an off-site location.

The Lime Pit property is currently being prepared for future light industrial redevelopment. The only soil contamination on the Lime Pit property which exceeds RCL's (recommended) are PAH compounds, which are widely distributed throughout the site. The highest PAH levels occur in shallow soil fill in the former lime slurry pit areas (southwestern corner of the site and the south eastern and eastern areas of the site).

The West Allis CDA seeks WDNR approval under WAC NR 718.13 to place the soil fill from the PST Parking Lot property contaminated with low levels of PAH compounds on the Lime Pit property in the former lime slurry pit areas. A summary of the quality and quantity of soil to be exported from the PST Parking Lot property, together with the relevant analytical data table and site figures, prepared by Arcadis (Draft Pre-design Engineering Report, March 2006), is attached.

PHONE: (262) 675-6000 P. O. BOX 856 • CEDARBURG WI 53012 FAX: (262) 675-6170 OFFICE@TEMCO-LLC.COM

Also attached is a Lime Pit Property figure showing the area where the soil fill will be placed, spread, and compacted. The accompanying soil contaminant distribution figure shows the high levels of PAH compounds in the former lime slurry pit areas. The northeast corner of the site, which was a former lime slurry pit area, has been reserved from filling temporarily. The City of West Allis is planning to place high capacity sanitary and storm sewer trunk lines on the Lime Pit property along the north property boundary in 2006. Relevant information concerning soil and groundwater conditions at the Lime Pit Property is contained in the Site Investigation Report prepared and submitted to WDNR by TEMCO in March 2006.

TEMCO has evaluated the soil fill placement plan with the requirements of WAC NR 718.13 (2) through (9), and believes the plan conforms with all of the listed conditions.

Placement of contaminated soil fill from the 6 Points/Farmers Market Redevelopment Project on the nearby Lime Pit site will be very beneficial to redevelopment of both properties. Excess soil from the 6 Points/Farmers Market properties represents a portion of the fill needed to level the Lime Pit site prior to redevelopment. Requests for approval to dispose contaminated soil from additional properties (the "700" properties) in the 6 Points/Farmers Market Redevelopment Project will be forwarded in the future under separate cover.

The Remedial Action Plan for the Lime Pit property will specify placement of a cap over areas containing PAH contaminants in the direct contact zone above recommended industrial RCL's. These areas include virtually all of the former lime slurry pit areas and small portions of the central, western and northern parts of the site. The site capping will likely take the form of industrial buildings, pavement above parking lots and walkways, and clay soil in landscape areas.

Please contact the undersigned with questions or if further information is needed. Thank you for your assistance in facilitating this important redevelopment project in the City of West Allis.

Sincerely,

THE ENVIRONMENTAL MANAGEMENT COMPANY LLC

Volume Estimates

Overall Earthwork Balance

Parking Lot Property

ARCADIS was provided with a construction cost estimate prepared by Landcraft Survey & Engineering, Inc. ("Landcraft") for the Parking Lot Property dated August 22, 2005. The estimate included earthwork quantities for the Parking Lot Property. Landcraft estimated a total of approximately 23,000 cubic yards of excess soil and surface materials (i.e., topsoil and asphalt pavement) would be generated at the Parking Lot Property due to the redevelopment activities.

ARCADIS performed a cut/fill balance using the current survey of the Parking Lot Property and the proposed topography of the site following redevelopment, and calculated that approximately 17,600 cubic yards of excess soil, including fill material and native soil, will be generated at the Parking Lot Property due to the redevelopment of the site.

Lime Pit Property

The Lime Pit Property is located in and owned by the city of West Allis. The general topography of the Lime Pit Property is undulatory and highly variable over short distances. The city of West Allis is in the early staged of planning redevelopment of the Lime Pit Property. The future use of the Lime Pit Property at this time is light industrial. However, the Lime Pit Property will require the importation of material to establish a uniform grade across the property.

The Lime Pit Property is relatively close to the Parking Lot Property. Therefore, the excess fill material at the Parking Lot Property could be reconsolidated at the Lime Pit Property (with WDNR approval). ARCADIS conducted a cut/fill balance at the Lime Pit Property using the Alta Survey and establishing a proposed site-wide ground elevation consistent with surrounding properties (727 feet above mean sea level). Then, ARCADIS calculated the volume of material required to be imported to create a uniform site grade. Approximately 36,000 cubic yards of soil may be accommodated at the Lime Pit Property. The Lime Pit Property is depicted on Figure 7.

DRAFT

Petroleum Contaminated Fill Material and Native Soil

There is approximately 700 to 900 cubic yards of petroleum impacted soil that remains on the Parking Lot Property. This petroleum contaminated soil contains benzene at concentrations above the ground protection RCL. Therefore, the 900 cubic yards of fill material and native soil is assumed to be load, transported , and disposed of at a landfill.

Fill Material Quantities and Disposal Estimate

ARCADIS reviewed the available soil boring analytical data in order to estimate the portion of the excess fill material that will qualify as either contaminated (landfill disposal or reconsolidation at Lime Pit Property) or clean fill material (no special disposal requirements). Based on available data, the following estimates were calculated:

Estimated quantity of fill material that will be generated during redevelopment of Parking Lot Property	13,000 cubic yards*
Estimated quantity of clean fill material (no special disposal requirements).	9,300 cubic yards
Estimated quantity of PAH-contaminated fill material (reconsolidation at Lime Pit Property)	3,700 cubic yards

* Volume includes the top 1-foot of surficial material including asphalt, concrete, base coarse material, and/or topsoil.

Native Soil Quantities and Disposal Estimate

ARCADIS reviewed the available soil boring analytical data in order to estimate the portion of the excess native soils that will qualify as qualify as either contaminated (non-hazardous special waste) or clean soil (no special disposal requirements). Based on available data, the following estimates were calculated:

Estimated quantity of native soil that will be generated during redevelopment of Parking Lot Property	3,700 cubic yards*
Estimated quantity of clean native soil (no special disposal requirements).	2,800 cubic yards
Estimated quantity of contaminated native soil (non-industrial RCL PAHs exceedances).	400 cubic yards

Estimated quantity of contaminated native soil (industrial RCL PAHs exceedances).	500 cubic yards

* Volume includes the top 1-foot of surficial material including asphalt, concrete, base coarse material, and/or topsoil.

Conclusions and Recommendations

The Parking Lot Property is part of the Six Points/Farmers Market Redevelopment Area which will require removal of approximately 17,600 cubic yards of the excess fill material and native soil. ARCADIS conclusions and recommendations are summarized in the following bulleted list:

- Approximately 900 cubic yards of petroleum contaminated fill material/native soil will require offsite disposal as a non-hazardous special waste.
- Approximately 13,000 cubic yards of excess fill material will be generated at the Parking Lot Property. Of this quantity, 9,300 cubic yards is clean and requires no special handling or disposal requirements. Approximately 3,700 cubic yards is impacted with PAHs and could be reconsolidated at the Lime Pit Property.
- Approximately 3,700 cubic yards of excess native soil will be generated at the Parking Lot Property. Of this quantity, 2,800 cubic yards is clean and requires no special handling or disposal requirements. Approximately 900 cubic yards is impacted with PAHs and will require management as a no-hazardous special waste.
- The volume of material to level the grade of the Lime Pit Property is estimated to be 36,000 cubic yards.

West Allis, WI. 53214

Subject: Reported contamination at Property 102: 1452 South 66Th St., West Allis,

Dear Mr. Stibal:

On July 25, 2005, Thomas Mueller of TEMCO, on behalf of the City of West Allis, notified the Wisconsin Department of Natural Resources (WDNR) that soil and groundwater contamination had been detected at the site described above.

Based on the information submitted to the WDNR, we believe that the City of West Allis is responsible for restoring the environment at the referenced site under Section 292, Wisconsin Stats., known as the hazardous substances spills law.

This letter describes your legal responsibilities as a person who is responsible under section 292.11, explains what you need to do to investigate, and clean up the contamination; provides you with information about cleanups, environmental consultants, and possible financial assistance; and working cooperatively with the Department of Natural Resources and Department of Commerce ("Commerce").

Legal Responsibilities:

Your legal responsibilities are defined both in statute and in administrative codes. The hazardous substances spill law, Section 292.11 (3) Wisconsin Statutes, states:

- RESPONSIBILITY. A person who possesses or controls a hazardous substance which is discharged or who causes the discharge of hazardous substance shall take the actions necessary to restore the environment to the extent practicable and minimize the harmful effects from the discharge to the air, lands, or waters of the state.

Wisconsin Administrative Code chapters NR 700 through NR 749 establish requirements for emergency and interim actions, public information, site investigations, design and operation of remedial action systems, and case closure. Chapter NR 708 includes provisions for immediate actions in response to limited contamination. Wisconsin Administrative Code chapter NR 140 establishes groundwater standards for contaminants that reach groundwater.

Steps to Take:

The longer contamination is left in the environment the farther it can spread and the more it may cost to clean up. Quick action may lessen damage to your property and neighboring properties and reduce your costs in investigating and cleaning up the contamination. To ensure that your cleanup complies with Wisconsin's laws and administrative codes, you should hire a professional environmental consultant who understands what needs to be done. These are the first three steps to take:

1. Within the next **30 days**, you should submit written verification (such as a letter from the consultant) that you have hired an environmental consultant. If you do not take action within this time frame, the WDNR may initiate enforcement action against you.

2. Within the next **60 days**, your consultant should submit a work plan and schedule for the investigation. The consultant must comply with the requirements in the NR 700 rule series and should refer to WDNR technical guidance documents. To facilitate prompt agency review of your reports, your consultant should use the site investigation and closure formats which are available on-line at www.dnr.state.wi.us.

Once an investigation has established the degree and extent of contamination involved at your site, your consultant will be able to determine whether Commerce or the Department of Natural Resources has authority over the case.

3. Within 30 days of completion of the site investigation, you or your consultant must provide a site investigation report per s. NR 716.15. As the remedial activities proceed, you or your consultant should also provide a brief progress report at least every 90 days as required by s. NR 724.13(3), Wis. Adm. Code. Quarterly reports need only include one or two pages of text, plus any relevant maps and tables. Should conditions at your site warrant, we may require more frequent contacts.

4. Sites where discharges to the environment have been reported are entered into the Bureau for Remediation and Redevelopment Tracking System ("BRRTS"), a version of which appears on the Department's Internet site. You may view the information related to your site at any time (http://www.dnr.state.wi.us/org/aw/rr/brrts) and use the feedback system to alert us to any errors in the data.

If you want a formal response from the Department on a specific submittal, please be aware that a review fee is required in accordance with ch. NR 749, Wis. Adm. Code. If a fee is not submitted with your reports, you should proceed under the advice of your consultant to complete the site investigation to maintain your compliance with the spills law and chs. NR 700 through NR 749. **Do not delay the investigation of your site by waiting for a Department response.** We have provided detailed technical guidance to environmental consultants. Your consultant is expected to know our technical procedures and administrative codes and should be able to answer your questions on meeting cleanup requirements.

All correspondence regarding this site should be sent to:

Victoria Stovall, Program Assistant
Remediation and Redevelopment Program
Wisconsin Department of Natural Resources
2300 North Martin Luther King Drive
Milwaukee, WI 53212

Unless otherwise requested, please send only one copy of plans and reports. To speed processing, correspondence should reference the BRRTS and FID numbers (if assigned) shown at the top of this letter.

Additional Information for Site Owners:
Information to help you select a consultant, and materials on controlling costs, understanding the cleanup process, and choosing a site cleanup method are enclosed. In addition, *Fact Sheet 2, Voluntary Party Remediation and Exemption from Liability* provides information on obtaining the protection of limited liability under s. 292.15, Stats.

Financial Assistance:
Reimbursement from the Petroleum Environmental Cleanup Fund (PECFA) may be available for some of the costs of cleaning up contamination from eligible petroleum storage tanks. Please refer to the enclosed information sheet entitled *"Information about PECFA"* for more information on eligibility and regulations for this program. For more information on the PECFA program, please call the Department of Commerce at 608-266-2424 or visit their web site at:
http://www.commerce.state.wi.us/COM/Com-Petroleum.html. Funding is also available for cleanup at some drycleaning sites.

Call the DNR Victoria Stovall, Program Assistant at (414) 263-8688 for more information on eligibility or visit the RR web site. http://www.dnr.state.wi.us/org/aw/rr. You may also contact this person for all other questions regarding this letter.

Thank you for your cooperation.

Sincerely,

Victoria Stovall
Program Assistant

Department of Natural Resources

Fax Notification For Hazardous Substance Discharge
(Non-Emergency Only)

Emergency Discharges / Spills should be reported via the 24-Hour Hotline: 1-800-943-0003

Notice: Hazardous substance discharges must be reported immediately according to the "Spills Law", s. 292.11 Wis. Stats., Section NR 706.05(1)(b), Wis. Adm. Code, requires that hazardous substance discharges are to be reported by one of three methods: telephoning the Department (toll free Spill Hotline number above), telefaxing a report to the Department or visiting a Department office in person. If you choose to notify the Department by telefax, you should use this form to be sure that all necessary information is included. However use of this form is not mandatory. Under s. 292.99, Wis. Stats., the penalty for violating the reporting requirements of ch. 292 Wis. Stats., shall be no less than $10 nor more than $5000 for each violation. Each day of continued violation is a separate offense. It is not the Department's intention to use any personally identifiable information from this form for any purpose other than program administration. However, information submitted on this form may also be made available to requesters under Wisconsin's Open Records Law (ss. 19.31 – 19.39, Wis. Stats.). Confirmatory laboratory data should be included with this form, to assist the DNR in processing this Hazardous Substance Release Notification.

Complete this form. **TYPE or PRINT LEGIBLY**. FAX it to the appropriate DNR region (see next page) **IMMEDIATELY** upon discovery of a potential release from **(check one)**:

- ☐ Underground Petroleum Storage Tank System
- ☐ Aboveground Petroleum Storage Tank System
- ☐ Dry Cleaner Facility (PERP eligibility based on: ☐ Facility owner/operator ☐ Property owner of licensed facility)
- Other - Describe: Unknown Sources

WisDOT Phase 1 Hazardous Materials Assessment Site Summary
(rev. 2/2016)

Instructions: following FDM 21-35-5, perform site assessment, fill in information for each site investigated. Multiple sites with no identified environmental concerns may be summarized on one form.

Recommendation acceptance/rejection/modification should be completed and signed by the person with the authority to make project decisions (for example: region hazardous materials coordinator, project manager, local road management consultant)

WisDOT Project ID: Project ID 2410-13-70
Highway/Street: West National Avenue
Termini/Limits: West 65th Street to West 62nd Street
County or Counties: Milwaukee

Property Information:
Site Name(s): Viking Mobil Communications Inc.
DOT parcel number (if known):
Property Address: 1421 South 62nd Street, West Allis, WI. 53214
Owner's Name: Richard Libbey
Owner's Address: 1421 South 62nd Street, West Allis, WI. 53214
Owner's Phone: phone number, including area code
Current Land Use: Commericla building
Past Land Use: Commerical building

Real Estate Requirements:
☐None ☐Total take ☐Strip acquisition of feet
☒Temporary Limited Easement (TLE)
☐Permanent Limited Easement (PLE)
☐ Other (describe)

Construction Requirements:
☒ Excavation within current right of way to a depth of 5-12 feet
☐ Excavation within proposed right of way to a depth of feet
☐ Excavation within easement to a depth of feet
☒ Public or private utility or sanitary or storm sewer installation or excavation to a depth of 5-12 feet

Information from database searches and interviews:
Department of Agriculture, Trade and Consumer Protection (DATCP)
- ☐ site has (number) registered tanks ☐ASTs (number) ☒USTs 2 (number)
- ☐ tanks are currently in use (number)
- ☐ some (number) ☐ all tanks are abandoned date(s):
- Tank contents and total number of tanks, both in place and abandoned:
  - ☒ Leaded gasoline ☐ Unleaded gasoline ☒ Fuel Oil
  - ☐ Diesel ☐ Kerosene ☐ Unknown ☐ Other (describe)
- Comments:

Department of Natural Resources (DNR)
- ☐ site is a DNR administered LUST site; BRRTS number:
- ☒ site is a DNR administered ERP site; BRRTS number: 02-41-174765
- ☒ site is a closed ☒LUST ☐ERP site; closure date: 2009
- ☐ site is a landfill
- ☐ site is an abandoned waste disposal site
- ☐ site is a hazardous waste generator EPA Generator ID:
- ☐ site is a spill site
- ☐ site has continuing obligations (attach copy of closure letter with continuing obligations)
- ☐ Other (please describe)

Sanborn Maps: site is a on map dated . Comments:

A check in a checkbox indicates a positive or "yes" response

WisDOT historic plan sets: site is a on project dated . Comments:
Business directories: site is a in the directory dated . Comments:
Aerial photos: site is a on photo dated . Comments:
☐ Contamination discovered at feet during utility or other excavation in the area. Indicate location on site map.
Interview Information or other comments:

Visual Evidence of Potential Contamination: (include additional information in space provided)
☐ No evidence of tanks
☐ USTs ☐ASTs Location, number and condition of tanks, contents, comments:
Location in relationship to current right of way: ☐ map attached
Location in relationship to proposed right of way: ☐ map attached
☐ Drums ☐Stained soils ☐Odor ☐Sheen on surface water ☐Areas of excavation ☐ Areas of fill
☐Stressed vegetation ☐ Pond(s) ☐ Basins/sumps ☐ Monitoring wells ☐ Soil borings
Comments:

Potential for Contaminant Migration: (attach supporting documentation such as plume maps, summaries of site investigation or closure reports).
☒ Property is a potential source of contamination
☐ Adjacent property is a potential source of contamination. Include site name and address or BRRTS number if known, describe location, and include contaminant type and any additional information.
☐ Contaminated soil within proposed right of way from feet to feet below ground surface
☐ Contaminated groundwater within proposed right of way at feet below ground surface.
☐ Contaminated soil or groundwater within existing right of way. Attach copy of most recent investigation and plume maps or DNR form 4400-286 and plume maps.

Attachments – required
☐ Site photographs and a site map showing areas of concern
☐ Plat map showing parcel and any proposed areas of acquisition or easement
☐ Historic aerial photos of site - clearly outline site
☐ Historic WisDOT or other as-builts and plat maps - clearly outline site
☒ Plume maps for known contamination. Indicate existing or proposed right of way on plume maps where applicable.
☐ Closure letter with continuing obligations for sites closed with continuing obligations

Recommendations
☐ No additional hazardous materials investigation is required.
☐ If construction or real estate requirements change, evaluation of need for further investigation will be necessary.
☐ Information is sufficient to use Standard Special Provisions. Copy of completed Standard Special Provision is attached.
☒ Conduct additional investigation
- ☒ Phase 2 (determine if contamination is present)
- ☐ Phase 2.5 (determine extent of contamination within existing R/W only)
- ☐ Phase 3 (determine full extent of contamination prior to acquisition)
- ☐ Phase 4 (remediate site)
- ☐ Other (describe)

☐ Site has continuing obligations. Coordination with DNR will be required.

Prepared by: Edward Diesch on 2/14/2020
Recommendations ☐accepted ☐modified ☐rejected by: Name and Title on
Modifications:
Signature of person accepting/modifying/rejecting recommendations:

_____ Date:_____

GIS Registry Checklist

Form 4400-245 (R 4/08)

This Adobe Fillable form is intended to provide a list of information that is required for evaluation for case closure. It is to be used in conjunction with Form 4400-202, Case Closure Request. The closure of a case means that the Department has determined that no further response is required at that time based on the information that has been submitted to the Department.

NOTICE: Completion of this form is mandatory for applications for case closure pursuant to ch. 292, Wis. Stats. and ch. NR 726, Wis. Adm. Code, including cases closed under ch. NR 746 and ch. NR 726. The Department will not consider, or act upon your application, unless all applicable sections are completed on this form and the closure fee and any other applicable fees, required under ch. NR 749, Wis. Adm. Code, Table 1 are included. It is not the Department's intention to use any personally identifiable information from this form for any purpose other than reviewing closure requests and determining the need for additional response action. The Department may provide this information to requesters as required by Wisconsin's Open Records law [ss. 19.31 - 19.39, Wis. Stats.].

BRRTS #: 03-41-114435 PARCEL ID #: 454-0071-001

ACTIVITY NAME: Viking Communications WTM COORDINATES: X: 683785 Y: 284591

CLOSURE DOCUMENTS (the Department adds these items to the final GIS packet for posting on the Registry)

☒ **Closure Letter**

☐ **Maintenance Plan** *(if activity is closed with a land use limitation or condition (land use control) under s. 292.12, Wis. Stats.)*

☒ **Conditional Closure Letter**

☐ **Certificate of Completion (COC)** for VPLE sites

SOURCE LEGAL DOCUMENTS

☒ **Deed:** The most recent deed as well as legal descriptions, for the **Source Property** (where the contamination originated). Deeds for other, off-source (off-site) properties are located in the **Notification** section.
Note: *If a property has been purchased with a land contract and the purchaser has not yet received a deed, a copy of the land contract which includes the legal description shall be submitted instead of the most recent deed. If the property has been inherited, written documentation of the property transfer should be submitted along with the most recent deed.*

☐ **Certified Survey Map:** A copy of the certified survey map or the relevant section of the recorded plat map *for those properties where the legal description in the most recent deed refers to a certified survey map or a recorded plat map.* (lots on subdivided or platted property (e.g. lot 2 of xyz subdivision)).

Figure #: **Title:**

☐ **Signed Statement:** A statement signed by the Responsible Party (RP), which states that he or she believes that the attached legal description accurately describes the correct contaminated property.

MAPS (meeting the visual aid requirements of s. NR 716.15(2)(h))

Maps must be no larger than 8.5 x 14 inches unless the map is submitted electronically.

☒ **Location Map:** A map outlining all properties within the contaminated site boundaries on a U.S.G.S. topographic map or plat map in sufficient detail to permit easy location of all parcels. If groundwater standards are exceeded, include the location of all potable wells within 1200 feet of the site.
Note: *Due to security reasons municipal wells are not identified on GIS Packet maps. However, the locations of these municipal wells must be identified on Case Closure Request maps.*

Figure #: 1 **Title: Site Location Map**

☒ **Detailed Site Map:** A map that shows all relevant features (buildings, roads, individual property boundaries, contaminant sources, utility lines, monitoring wells and potable wells) within the contaminated area. This map is to show the location of all contaminated public streets, and highway and railroad rights-of-way in relation to the source property and in relation to the boundaries of groundwater contamination exceeding a ch. NR 140 Enforcement Standard (ES), and/or in relation to the boundaries of soil contamination exceeding a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Levels (SSRCL) as determined under s. NR 720.09, 720.11 and 720.19.

Figure #: 3 **Title: Boring/Sample Site Location Map**

☒ **Soil Contamination Contour Map:** For sites closing with residual soil contamination, this map is to show the location of all contaminated soil and a single contour showing the horizontal extent of each area of contiguous residual soil contamination that exceeds a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Level (SSRCL)as determined under s. NR 720.09, 720.11 and 720.19.

Figure #: 5 **Title: Degree/Extent DRO Soil Impact Map** **Figure #: 6** **Degree/Extent GRO Soil Map**

BRRTS #: 03-41-114435 ACTIVITY NAME: Viking Communications

MAPS (continued)

☐ **Geologic Cross-Section Map:** A map showing the source location and vertical extent of residual soil contamination exceeding a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Level (SSRCL). If groundwater contamination exceeds a ch. NR 140 Enforcement Standard (ES) when closure is requested, show the source location and vertical extent, water table and piezometric elevations, and locations and elevations of geologic units, bedrock and confining units, if any.

Figure #: **Title:**

Figure #: **Title:**

☐ **Groundwater Isoconcentration Map:** For sites closing with residual groundwater contamination, this map shows the horizontal extent of all groundwater contamination exceeding a ch. NR140 Preventive Action Limit (PAL) and an Enforcement Standard (ES). Indicate the direction and date of groundwater flow, based on the most recent sampling data.
Note: *This is intended to show the total area of contaminated groundwater.*

Figure #: **Title:**

☐ **Groundwater Flow Direction Map:** A map that represents groundwater movement at the site. If the flow direction varies by more then 20° over the history of the site, submit 2 groundwater flow maps showing the maximum variation in flow direction.

Figure #: **Title:**

Figure #: **Title:**

TABLES (meeting the requirements of s. NR 716.15(2)(h)(3))

Tables must be no larger than 8.5 x 14 inches unless the table is submitted electronically. Tables must not contain shading and/or cross-hatching. The use of **BOLD** or *ITALICS* is acceptable.

☒ **Soil Analytical Table:** A table showing remaining soil contamination with analytical results and collection dates.
Note: This is one table of results for the contaminants of concern. Contaminants of concern are those that were found during the site investigation, that remain after remediation. It may be necessary to create a new table to meet this requirement.

Table #: **Title: Viking Communications Soil Laboratory Results**

☐ **Groundwater Analytical Table:** Table(s) that show the most recent analytical results and collection dates, for all monitoring wells and any potable wells for which samples have been collected.

Table #: **Title:**

☐ **Water Level Elevations:** Table(s) that show the previous four (at minimum) water level elevation measurements/dates from all monitoring wells. If present, free product is to be noted on the table.

Table #: **Title:**

IMPROPERLY ABANDONED MONITORING WELLS

For each monitoring well not properly abandoned according to requirements of s. NR 141.25 include the following documents.
Note: *If the site is being listed on the GIS Registry for only an improperly abandoned monitoring well you will only need to submit the documents in this section for the GIS Registry Packet.*

☒ **Not Applicable**

☐ **Site Location Map:** A map showing all surveyed monitoring wells with specific identification of the monitoring wells which have not been properly abandoned.
Note: *If the applicable monitoring wells are distinctly identified on the Detailed Site Map this Site Location Map is not needed.*

Figure #: **Title:**

☐ **Well Construction Report:** Form 4440-113A for the applicable monitoring wells.

☐ **Deed:** The most recent deed as well as legal descriptions for each property where a monitoring well was not properly abandoned.

☐ **Notification Letter:** Copy of the notification letter to the affected property owner(s).

BRRTS #: 03-41-114435 ACTIVITY NAME: Viking Communications

NOTIFICATIONS

Source Property

☐ **Letter To Current Source Property Owner:** If the source property is owned by someone other than the person who is applying for case closure, include a copy of the letter notifying the current owner of the source property that case closure has been requested.

☐ **Return Receipt/Signature Confirmation:** Written proof of date on which confirmation was received for notifying current source property owner.

Off-Source Property

Group the following information per individual property and label each group according to alphabetic listing on the "Impacted Off-Source Property" attachment.

☐ **Letter To "Off-Source" Property Owners:** Copies of all letters sent by the Responsible Party (RP) to owners of properties with groundwater exceeding an Enforcement Standard (ES), and to owners of properties that will be affected by a land use control under s. 292.12, Wis. Stats.
Note: *Letters sent to off-source properties regarding residual contamination must contain standard provisions in Appendix A of ch. NR 726.*

Number of "Off-Source" Letters:

☐ **Return Receipt/Signature Confirmation:** Written proof of date on which confirmation was received for notifying any off-source property owner.

☐ **Deed of "Off-Source" Property:** The most recent deed(s) as well as legal descriptions, for all affected deeded **off-source property(ies).** This does not apply to right-of-ways.
Note: *If a property has been purchased with a land contract and the purchaser has not yet received a deed, a copy of the land contract which includes the legal description shall be submitted instead of the most recent deed. If the property has been inherited, written documentation of the property transfer should be submitted along with the most recent deed.*

☐ **Letter To "Governmental Unit/Right-Of-Way" Owners:** Copies of all letters sent by the Responsible Party (RP) to a city, village, municipality, state agency or any other entity responsible for maintenance of a public street, highway, or railroad right-of-way, within or partially within the contaminated area, for contamination exceeding a groundwater Enforcement Standard (ES) and/or soil exceeding a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Level (SSRCL).

RE: **Final Closure**

Commerce # 53214-5090-21-A DNR BRRTS # 03-41-114435
Viking Communications, 1421 South 62nd Street, West Allis

Dear Mr. Dragotta:

The Wisconsin Department of Commerce (Commerce) has received all items required as conditions for closure of the site referenced above. Payment of the required soil GIS Registry fee was recorded by the Department of Natural Resources (DNR). On March 17th, you informed Commerce that no monitoring wells were installed on the property, and therefore, no abandonment was required. The groundwater GIS Registry fee is not required because no petroleum constituents exceeded regulatory standards in the borehole water sample. On April 16th, Commerce obtained a copy of the property deed from the County Register of Deeds office (copy for your records is enclosed). This site is now listed as "closed" on the Commerce database and will be included on the DNR's GIS Registry of Closed Remediation Sites to address residual soil contamination. To view all sites on the GIS Registry web page, go to http://dnr.wi.gov/org/aw/rr/gis/index.htm. If you intend to construct a potable well on this property, you must get prior DNR approval.

Please note that it appears that the Tax Key number on the property deed is incorrectly listed as 474-0071-000. City of West Allis on-line records list the property as Parcel 454-0071-001, so the West Allis number is being used for property reference purposes. A copy of the City's parcel information is enclosed for your reference.

All current and future owners and occupants of the property need to be aware that excavation of contaminated soil may pose a hazard. Special precautions may be needed to prevent inhalation, ingestion or dermal contact with the residual contamination when it is removed. If soil is excavated, the property owner at the time of excavation must have the soil sampled and analyzed to determine if residual contamination remains. If sampling confirms that contamination is present, the property owner at the time of excavation must determine whether the material would be considered solid or hazardous waste and ensure that any storage, treatment or disposal is in compliance with applicable State regulations and standards.

Costs for sampling and excavation activities conducted after case closure are not eligible for PECFA reimbursement. However, if it is determined that any undisturbed remaining petroleum contamination poses a threat, the case may be reopened and further investigation or remediation may be required. If this case is reopened, any original claim under the PECFA fund would also reopen and you may apply for assistance to the extent of remaining eligibility. It is in your best interest to keep all documentation related to environmental activities at your site.

Thank you for your efforts to bring this case to closure. If you have any questions, please contact me in writing at the letterhead address or by telephone at (414) 357-4703.

Sincerely,

Linda M. Michalets
Senior Hydrogeologist

RE: CASE CLOSURE **CONDITIONAL UPON RECEIPT OF DOCUMENTATION**
COMMERCE #53214-5090-21 BRRTS #03-41-114435
Viking Communications, 1421 S 62nd Street, West Allis, WI

Dear Mr. Dragotta:

The above named site was re-evaluated for closure on April 5, 2001, by the Site Review Staff of the PECFA Bureau. Using the standards established in Chapter NR 700 and Comm 46, the Department has determined that this site has been investigated/remediated to a level that is protective of human health and the environment. The Department considers this site to meet environmental standards and no further action is necessary.

The case may be re-opened in the future if site conditions indicate that any contamination that might remain poses a threat to human health or the environment. The need for additional remediation would be determined and required if necessary. If subsequent information indicates a need to reopen this case, any original claim under the PECFA fund would also reopen and reimbursed to the extent of any remaining eligibility.

This case will not be considered "closed" on our computer database until the Department is in receipt of the following documentation:

1. Analytical laboratory reports and associated chain of custody forms for data collected from soil boreholes VC-1, VC-2, VC-3, VC-4, and VC-5 need to be submitted for the previous sampling round of March 6, 1997.
2. Soil boring logs and abandonment forms must be submitted for VC-1, VC-2, VC-3, VC-4, and VC-5.
3. The report, *Site Investigation Work Plan,* dated February 23, 1997, indicated one 550 gallon leaded gasoline underground storage tank (UST) and one 5,000 gallon fuel oil UST were removed on December 12, 1996. Tank disposal documentation, excavated soil disposal documentation, and tank sludge disposal forms for both the above-mentioned USTs must be submitted.
4. *A notification must be placed on the property deed addressing residual soil and groundwater impacts* The department must have a copy of the deed notification that contains the County Register of Deeds' recording information to complete the case closure. Enclosed is an example of a "Notice of Contamination to Property" for your use. If you wish to modify the language, submit a copy to this office for approval prior to filing.

Thank you for your efforts in restoring Wisconsin's environment. If you have any additional questions, please call the number listed below.

Sincerely,

Andrew Alles

Document Number	NOTICE OF CONTAMINATION TO PROPERTY

Legal Description of the Property: In re:

(as it appears on the most recent deed)

Recording Area

Name and Return Address

STATE OF WISCONSIN)
) ss
COUNTY OF)

Parcel Identification Number (PIN)

Section 1. _____ is the owner of the above-described property.

Section 2. One or more petroleum discharges have occurred at this property. Gasoline Range Organics (GRO) and Diesel Range Organics (DRO) contaminated soils above NR 720 residual contaminant levels of the Wisconsin Administrative Code exist(s) on this property as shown on the attached map.

Section 3. The owner hereby declares that all of the property described above is held and shall be held, conveyed or encumbered, leased, rented, used, occupied and improved subject to the following limitations and/or restrictions:

Residual petroleum contaminated soil with GRO and DRO levels as high as 450ppm and 950ppm, respectively remains on this site in the area of the former borings of VC-1, VC-2, and VC-4, as shown on the attached map. It has been shown that these levels are protective of health and the environment. If this contaminated soil is excavated in the future, it may be considered a solid waste and will need to be disposed in accordance with all applicable laws.

Any person who is or becomes owner of the property described above may request that the Wisconsin Department of Commerce, or its successor, issue a determination that the restrictions set forth in this covenant are no longer required. That property owner shall provide any and all necessary information to the Department in order for the Department to be able to make a determination. Upon receipt of such a request, the Department shall determine whether or not the restrictions contained herein can be extinguished. Conditions under which a restriction may be extinguished will be determined in accordance with the site specific standards, rules and laws for this property. If the Department determines that the restrictions can be extinguished, an affidavit, with a copy of the Department's written determination, may be recorded to give notice that this restriction, or portions of this restriction are no longer binding. Any restriction placed upon this property shall not be extinguished without the Department's written determination.

IN WITNESS WHEREOF, the owner of the property has executed this document, this _____ day of _____, 20____.

[When appropriate use the following clause]:

By signing this document, [he/she] acknowledges that [he/she] is duly authorized to sign this document on behalf of _____.

Comments:

Potential for Contaminant Migration: (attach supporting documentation such as plume maps, summaries of site investigation or closure reports).
☒ Property is a potential source of contamination
☐ Adjacent property is a potential source of contamination. Include site name and address or BRRTS number if known, describe location, and include contaminant type and any additional information.
☐ Contaminated soil within proposed right of way from feet to feet below ground surface
☐ Contaminated groundwater within proposed right of way at feet below ground surface.
☐ Contaminated soil or groundwater within existing right of way. Attach copy of most recent investigation and plume maps or DNR form 4400-286 and plume maps.

Attachments – required
☐ Site photographs and a site map showing areas of concern
☐ Plat map showing parcel and any proposed areas of acquisition or easement
☐ Historic aerial photos of site - clearly outline site
☐ Historic WisDOT or other as-builts and plat maps - clearly outline site
☐ Plume maps for known contamination. Indicate existing or proposed right of way on plume maps where applicable.
☒ Closure letter with continuing obligations for sites closed with continuing obligations

Recommendations
☐ No additional hazardous materials investigation is required.
☐ If construction or real estate requirements change, evaluation of need for further investigation will be necessary.
☒ Information is sufficient to use Standard Special Provisions. Copy of completed Standard Special Provision is attached.
☐ Conduct additional investigation
- ☐ Phase 2 (determine if contamination is present)
- ☐ Phase 2.5 (determine extent of contamination within existing R/W only)
- ☐ Phase 3 (determine full extent of contamination prior to acquisition)
- ☐ Phase 4 (remediate site)
- ☐ Other (describe)

☐ Site has continuing obligations. Coordination with DNR will be required.

CONTINUING OBLIGATIONS APPLY

Due to remaining contamination, continuing obligations apply to one or more properties. For information specific to the continuing obligations review the documentation below. Prior to constructing or reconstructing a water supply well, you need to contact DNR for approval of well construction specifications.

RE: Pressed Steel Tank Co., Inc. Facility Located at 1445 South 66th Street in Milwaukee, Wisconsin - STS Project No. 5-87255XA
WDNR FID # 241037940
WDNR BRRTS # 03-41-000421

Dear Mr. Amadi:

Enclosed please find completed soil and groundwater GIS Registry Packets for the referenced site, and required checks in the amounts of $200 and $250, respectively. Please note that the requested GIS Registries apply only to lots 20, 21 and 22 of Block 3 in C.A. Maynard and Agnew's Subdivision No. 3 in the NE1/4 of Section 3, T6N, R21E, in the City of West Allis, County of Milwaukee, State of Wisconsin as specified on the enclosed Warranty Deed, and as indicated on the enclosed maps that illustrate the horizontal extents of affected soil and groundwater.

We trust that the information contained herein adequately meets your current needs. If you have any questions, please do not hesitate to contact us.

Respectfully,

STS CONSULTANTS, LTD.

SUBJECT: Final Case Closure - Pressed Steel Tank, 1445 South 66th Street, West Allis, WI 53214; FID#: 241037940; BRRTS #: 03-41-000421.

Dear Mr. Darling:

In November, 1999, your site as described above was reviewed for closure by the Department of Natural Resources. The Department reviews environmental remediation cases for compliance with state laws and standards to maintain consistency in the closure of these cases. On November 12, 1999, you were notified that conditional closure was granted to this case.

The conditions of the closure required the responsible party (RP) to: a) place a soil and groundwater use restriction on the property; and b) abandon the monitoring wells (MW -1A, MW-1P, MW-1C, MW-2/RW-1, MW-3, MW-4, MW-5, MW-6 through MW-10). On March 26, 2003, the Department received correspondence indicating that the RP had opted to implement soil and groundwater GIS, in lieu of the soil and groundwater use restriction. However, the monitoring wells were not abandoned and will be used for other on-going remedial cleanup activities (BRRTs#: 02-41-385114 & 06-41-272740) at the property. The monitoring wells will be abandoned when those cleanup activities are completed. Based on the correspondence and data provided, it appears that your site has been remediated to Department standards in accordance with s. NR 726.05, Wis. Adm. Code. The Department considers this case closed and no further investigation, remediation or other action is required at this time.

Your site will be listed on the DNR Remediation and Redevelopment GIS Registry of Closed Remediation Sites. Information that was submitted with your closure request application will be included on the registry. To review the sites on the GIS Registry web page, visit http://gomapout.dnr.state.wi.us/org/at/et/geo/gwur/index.htm

Please be aware that this case may be reopened pursuant to s. NR 726.09, Wis. Adm. Code, if additional information regarding site conditions indicates that contamination on or from the site poses a threat to public health, safety or welfare, or the environment.

The Department appreciates your efforts to restore the environment at this site. If you have any questions regarding this letter, please contact me at (414) 263-8639.

Sincerely,
Eric Amadi

November 12, 1999

Mr. George Garneau
Pressed Steel Company
1445 S. 66th Street
West Allis, WI 53214

Subject: Case Closure for Pressed Steel Tank, 1445 S. 66th Street, West Allis, WI FID: 241037940, BRRTS: 03-41-000421.

Dear Mr. Garneau:

This letter is in response to the case closure request submitted by Graef, Anhalt, Schloemer, & Associates for the above-named site dated July 28, 1999. I presented this case to the Department's closure committee on 11/11/99. Based on the investigation and remedial documentation provided to the Department, the committee has decided to "conditionally close" this case with no further action at this time. The following items must be completed before final closure is granted and the case is officially tracked as such from the Department's tracking system:

1. A groundwater use restriction recorded at the County Register of Deeds office and a copy sent to this office [per s. NR 726.05(2)(b) and NR 726.05(8)(am)]. This is based on groundwater contamination above ch. NR 140 groundwater quality standards found in MW-1A, MW-1C, MW-2/RW-1 (04/13/99), and MW-5 (10/27/93).

2. A deed restriction recorded at the County Register of Deeds office and a copy sent to this office [per s. NR 726.05(2)(b) and NR 726.05(8)(b)]. This is based on contaminated soils left in-place after site remediation.

3. Abandonment of groundwater monitoring wells relevant to the former tank location as required in s. NR 726.05(8)(c) and forms sent to this office within 60 days.

Draft copies of the groundwater use and deed restriction should be sent to me for review. These will then be sent to our legal staff in Madison for final review. **Do not** file these documents until the Department's legal staff notifies you that their review process has been completed. After items No. 1 thru 3 above have been completed, the final closure letter will be sent to you.

The Department's Publication RR-606, *"Close Out Guidance on the Use of Deed and Groundwater Use Restrictions and Deed Notices"*, contains information about deed restrictions and document formats that should be used. This guidance can be obtained from the Department's web site at:

FACILITY DESCRIPTION ABSTRACT

Project Contact:	Mr. James Julien, Manager of Facilities, Maintenance, and Environment 1445 South 66th Street West Allis, Wisconsin 53214
Site Address:	1445 South 66th Street West Allis, Wisconsin 53214
Site Description:	NW1/4, NE1/4, Section 3, T6N, R21E, Milwaukee County
Type of Operation:	Company Fuel
Tank Excavation:	One 1,000 gallon gasoline tank

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was contracted by Pressed Steel Tank Inc. to perform an investigation of possible soil and groundwater contamination resulting from the operation of an underground petroleum storage tank at 1445 South 66th Street, West Allis, Wisconsin (Figure 1).

BACKGROUND

On September 19, 1989, a 1,000-gallon underground regular gasoline storage tank was removed at Pressed Steel Tank Company Inc. The tank excavation was located in a tightly confined area at the far southeast corner of the property near the intersection of 66th Street and National Avenue. The excavation was surrounded on the east and south sides by a security fence, to the west by a retaining wall and a vault for the sprinkler system, and to the north by a concrete drive. The property boundary is two feet outside the fence (Figure 2).

During excavation, a gasoline odor was noticed at a depth of 3.5 feet. The sand backfill was screened with an HNu Model PI-101 photoionization detector and was found to contain 100+ ppm (parts per million) of volatile organic compounds (VOCs). After removal of the backfill, the perimeter soil material was sampled and screened with the HNu. VOC levels were 60 to 208 ppm.

While excavating along the west side of the tank, a storm sewer lateral was encountered at a depth of 5.0 feet, approximately 1.5 to 2.0 feet west of the tank. While removing the tank, the storm sewer lateral was punctured in two places. The section of sewer piping running through the excavation and the contaminated sand that surrounded it were removed. Stained soil was observed around the sections of sewer lateral that extended to the north and south beyond the excavation.

On September 20, 1989, the contractor removed the fence around the pit. The pit was excavated to the limits of the property, and the maximum depth the contractor could reach. Final dimensions of the pit were 20.2 feet by 9.0 feet by 8.5 feet deep. The perimeter material was sampled and screened with the HNu; VOC levels were greater than 50 ppm.

Approximately 45 cubic yards of contaminated soils were stockpiled in the staging area. The soils were placed on an impermeable layer of plastic on top of the asphalt parking lot across 66th Street. The edges of the plastic were turned up to prevent precipitation run-off from entering the pile. The soil was also covered by an impermeable layer of plastic to prevent infiltration of precipitation and subsequent leaching of contamination.

Laboratory analysis of a composite soil sample had concentrations of 320 ppm TPH, 830 ppb (parts per billion) benzene, 3,500 ppb ethylbenzene, 6,000 ppb toluene, and 31,000 ppb total xylene. These results are further evidence of soil contamination occurring at the site.

On September 21, 1989, holes were augered into the center of each excavation wall (except the retaining wall) to a distance of 5.0 to 5.5 feet, at a depth of 7.0 to 7.5 feet. Samples were taken, screened with the HNu and sent to the laboratory for analysis of total petroleum hydrocarbons (TPH). Also, a test pit was dug in the base of the excavation. Water, possibly groundwater, was encountered at a depth of 12.5 feet. However, no sample was collected because of the questionable validity of the samples; water ponded in the sediments surrounding a tank would probably have anomalous chemical constituents levels that are probably uncorrelatable to groundwater constituent levels. A soil sample was taken, field-screened, and sent to the laboratory for analysis of TPH. Photoionization detector field screening for VOCs measured concentrations greater than 100 ppm in the initial excavation, from 50 to 60 ppm after overexcavation, and 28 to 63 ppm at a distance of five feet into the walls. VOC concentrations in the base of the excavation increased from 120 ppm at 8.25 feet to 242 ppm at 12.16 feet (Appendix A).

Soil samples collected from a distance of five feet into the walls contained from 24 to 440 ppm gasoline (laboratory interpretation of samples) and a sample from the base of the excavation contained 28 ppm gasoline.

SCOPE OF WORK AND OBJECTIVES

During this phase of investigation, the extent of study included three soil borings and three monitoring wells (Figure 2). Soil borings were drilled to determine the degree

and extent of soil contamination. Monitoring wells were constructed to sample groundwater in order to determine whether on-site groundwater was contaminated.

METHODS OF INVESTIGATIONS AND FIELD OBSERVATIONS

Every attempt was made to locate soil borings where subsurface conditions could best be documented. However, subsurface conduits, structures, and property boundaries restricted the location of boreholes.

Soil boring and monitoring well construction began on April 17, 1990, and continued through April 18, 1990 (Appendices B and C). Three soil borings (Figure 2) were drilled with a Central Mining Equipment Model 45 truck-mounted drill rig, using 2.75 inch inner diameter hollow stem augers. Soil samples were collected continuously using split spoon samplers. For each sampling interval, a split spoon was driven through the lead auger, the spoon removed, the auger closed, and the hole bored to the base of the sampled interval. After a sample was removed, the spoon was washed with TSP, double rinsed with potable water, and assembled for the next sample interval.

Each sample was split approximately in half and placed in Ziploc plastic bags. The first half was bagged and placed in a cooler in order to preserve the sample for possible laboratory analysis. The second half, enclosed in a Ziploc plastic bag, was allowed to reach room temperature and was then field screened for volatile organic compounds (VOCs). Samples were field screened with an HNu brand Model PI-101 photoionization detector. The detector was calibrated to benzene at the start of the field day and checked with benzene at the close of the day for instrument drift.

Soil samples collected for laboratory analysis were collected where the highest VOC concentration occurred in a boring, and again at the end of a boring. The samples were placed in four-ounce glass jars and packed tight to eliminate as much head space as possible. Sample jars were sealed with Teflon-lined lids, placed in a cooler and sent to a state certified laboratory. Soil samples submitted to the laboratory were analyzed for TPH.

Monitoring wells were constructed in three boreholes (Figure 2). Monitoring well construction was as follows. A ten feet long PVC well screen with 0.010 inch slots

was connected to a half-foot end cap and a schedule 40 PVC well case. PVC sections were connected using internal threads and a rubber O-ring seal between coupled sections.

After the well case was centered in a bore hole, a filter pack of number 45-50 sand was constructed to two feet above the well screen section. The filter sand was followed by two feet of fine sand. The fine sand was followed by two feet of bentonite pellets, followed by granular bentonite to two feet below ground surface (bgs). However, in MW-2 the fine sand was not used because the top of the screen was too close to ground surface. Monitoring wells were initially finished with flush with grade covers because of site traffic. However, GAS was informed that the area around MW-1 would be filled to sidewalk grade. Accordingly the PVC well case was extended to two feet above the proposed grade and the well finished with an above grade protective cover (Appendix C).

Monitoring well MW-1 extends to a depth of 27.87 feet below ground surface (bgs) and is located 30 feet southwest of the original tank excavation. Monitoring well MW-2 extends to a depth of 16.44 feet bgs and is located 50 feet northwest of the tank excavation. Monitoring well MW-3 extends to a depth of 18.66 feet bgs and is located 80 feet northeast of the tank excavation.

Monitoring wells were developed to remove fine-grained sediment from well screens and filter packs, and to develop the hydrological connection between wells and the formation. A bailer was used to purge wells dry. Wells were allowed to recover, then purged dry again. Approximately 18.5 gallons of water was bailed from MW-1. The well produced clear, sediment-free water. Approximately 39.5 gallons of water was bailed from MW-2. The water was turbid and had a petroleum odor. Droplets of petroleum were floating on the water. Approximately 28.5 gallons of water was bailed from MW-3. The water was initially turbid and remained turbid.

Before groundwater samples were collected, wells were purged in order to remove stagnant water from well casings and filter packs. Approximately 13.5 gallons was removed from MW-1, 12.5 gallons was removed from MW-2, and 9.5 gallons was removed from MW-3. Temperature, pH, and conductivity of the water samples were measured when samples were collected.

Soil Borings

The sediments encountered in the soil borings had a complex distribution; coarse-grained sediments grade into and are interbedded with fine-grained sediments (Figure 3). Soil boring SB-1 is located at the end of a topographically depressed trench-like area that contains a railroad siding, which parallels a loading dock area. Neither A or B soil horizons were present in SB-1. The sediments in SB-1 included clays and sandy clays (Appendix B).

Soil Boring SB-2 is located adjacent to a plant building. The upper ten feet of SB-2 was sand and gravel; no soil horizons were observed. It is probable that the sands and gravel are fill implaced during construction.

Soil Boring SB-3 is located on a topographic high that is also a surface water divide. In SB-3, below a layer of asphalt and crushed stone, sediments from 1 to 3 feet bgs appeared to be native soil horizons. The sediments at the location of SB-3 are probably an unaltered natural distribution. Below the soil horizons, 9 feet of clays occur. Below the clays, 11 feet of clayey sand, sand, and gravel occur.

The sands and gravels in SB-3 probably grade into the sandy clays in SB-1. A sand stringer in SB-1 may also be connected to the sand and gravel in SB-3 (Figure 3). The upper clay unit in the three soil borings appears to be the same unit, forming a seal between the surface and coarser-grained more permeable sediments at depth.

Field Screening

Samples from soil borings were field screened for VOCs using an HNu Model PI-101 photoionization detector. VOC levels ranged from <0.1 ppm to 400 ppm (Table 1). In soil boring SB-1 VOC levels were comparatively higher in the upper 19 feet than in the lower 20 feet: an average of 16 ppm compared to an average of 1.5 ppm in the lower zone. VOC levels were highest in the upper 7 feet; the levels ranged from 25 to 30 ppm. In soil boring SB-2, VOC levels were high, an average of 106 ppm. The maximum level, 400 ppm, occurred at 7 to 9 feet bgs in a layer of black-stained sediment. The soil had a noticeable gasoline odor. In soil boring SB-3, VOC levels were low. No sample had a VOC level higher than 0.5 ppm. The average was 0.2 ppm.

Groundwater

The water table elevations were measured on four occasions (Table 2). The first two measurements were collected during well development on April 24 and 30, 1990 (Figure 4). On those occasions the apparent flow direction was east of south (S16°E and S8°E). The third measurement was collected before sampling, on May 21, 1990. The apparent flow direction was to the south (S10°E).

The first three sets of measurements were collected before well covers were vented. When well covers were opened an audible release of air occurred, and well covers were lifted by pressure from released gases. After the well covers were vented and wells allowed to stabilize for two weeks, water table elevations were measured. The apparent flow direction on June 6, 1990, was to the south (S17°E). Throughout the investigation, the wells had a consistent flow direction to the south averaging S13°E.

Although the apparent flow direction appears to preclude the possibility of groundwater flow from the area where the storage tank was located, toward MW-2 (Figure 4), the water table at the tank excavation area is probably a local high. The resulting flow would be radial as in Figure 5, and thus to both MW-2 and MW-3. Additionally, a radial flow pattern would in part help to explain the observed difference in soil and groundwater BTEX levels. Additionally, a sewer lateral was located adjacent to the storage tank (Initial Environmental Assessment). The lateral extends to the west through the loading dock and to the south across National Avenue. Sediments along the sewer were probably a conduit for movement of water and petroleum from the tank area towards the loading dock area.

During the investigation from April 24 to June 6, water table elevations in MW-1, MW-2, and MW-3, in general, had an increasing trend (Figure 6). However, the water table elevations in MW-3 decreased between the third and fourth measurements.

LABORATORY RESULTS

Soil Samples

Soil samples were collected from the intervals where field screening indicated possible contamination and at the end of a boring. Soil samples were submitted to a state

certified laboratory (Appendix F). Only one soil sample had TPH levels above the laboratory detection limit of 5 ppm (Table 1). In soil boring SB-2, soils from 7 to 9 feet bgs were stained black, smelled of petroleum, and field screened at 400 ppm VOCs. The soil sample had a TPH level of 550 ppm, characterized as gasoline. The soil sample from the end of SB-2 had no detection of TPH. No TPH was detected in either SB-1 or SB-3.

Water Samples

Groundwater samples were collected on May 21, 1990, and submitted to a state certified laboratory (Appendix G). VOC scans were run on the samples to analyze for BTEX to verify field VOC screening results, and to test for possible site safety hazards. Monitoring well MW-1 did not contain measurable levels of BTEX, however, three species of chlorinated hydrocarbons were detected (Table 3). In monitoring well MW-2, both ethylbenzene and xylenes were detected at levels above the Wisconsin Department of Natural Resources (WDNR) preventative action limit (PAL), and in the case of xylenes, the level was above the WDNR enforcement standard (ES) and the PAL. Additionally, a chlorinated hydrocarbon, 1,1-dichloroethylene was detected in MW-2 at a concentration above both the PAL and the ES. In monitoring well MW-3, ethylbenzene and xylenes were detected. However, levels were below the PAL and ES for those compounds. Additionally, 1,1-dichloroethylene was detected at a concentration level above both the PAS and the ES.

CONCLUSIONS AND RECOMMENDATIONS

During the initial field investigation, field screening for VOCs and laboratory analysis for TPH detected significant levels of petroleum contamination, and a probable migration path, the sewer lateral, was encountered in the tank excavation. Sediments encountered in the initial tank excavation were predominantly clays. As expected, the sediments encountered in soil boring SB-1 were clays. The sediments in SB-2, however, were sands for the first eleven feet, as were the sediments in SB-3 from 12 to 23 feet bgs. Whether the sands in SB-2 are connected to SB-3 was not determined. The sewer lateral that extended through the tank excavation probably intersects the sand unit present in SB-2.

TABLE 3

Groundwater Chemical Concentrations

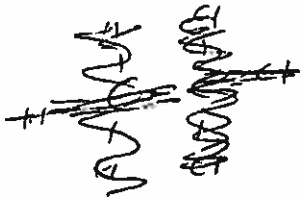
Groundwater Chemical Concentrations

5-21-90 Compound	MW-1 (PPB)	MW-2 (PPB)	MW-3 (PPB)	Enforcement Standard(ES) (PPB)	Preventative Action Limit(PAL) (PPB)
Benzene	ND	ND	ND	0.67	0.067
Toluene	ND	ND	ND	343	68.6
Ethylbenzene	ND	1000 PAL	94	1360	272
Total Xylenes	ND	4400 ES	38	620	124
Dichlorobromomethane	91	ND	ND	NA	NA
Methyl Chloride	190	ND	ND	150	15
Trichloroethene	1300	ND	ND	1.8	0.18
1,1-Dichloroethene	ND	27 ES	160 ES	0.24	0.024



Groundwater flow direction as indicated by field measurements would preclude migration of floating petroleum and contaminated groundwater from the tank location to MW-2, but the tank was topographically higher, and as such the water table at the tank excavation is probably higher; groundwater flow is probably to the northwest as well as to the south.

Groundwater samples from the monitoring wells MW-2 and MW-3 had petroleum contamination. However, only MW-2 had concentration levels above the WDNR PAL or ES. No petroleum contamination was detected in monitoring well MW-1, which was located ten feet west of the tank excavation. However, an in-ground cement vault was located between the tank excavation and MW-1. The vault probably was a barrier to flow of the upper few feet of groundwater flow and accordingly petroleum.

VOCs were detected in all three wells. Of the four halogenated hydrocarbons detected, three are listed in the Wisconsin Groundwater Quality Standards. All three compounds are above the respective PALs and ESs.

It is recommended that additional soil borings and monitoring wells be constructed to the south of the tank excavation to determine if soils and groundwater in that area were affected by petroleum contamination. Groundwater flow on the south side of the tank excavation is to the south, off the Pressed Steel Tank property limits. The area of recommended additional investigation is to the south of National Avenue.

SUBJECT: Monitoring of Remediation at Pressed Steel Tank Inc.,
FID 241037940
LUST

Dear Ms. Chung:

The purpose of this letter is to document operation of the groundwater remedial system at Pressed Steel Tank, Inc., 1445 South 66th Street, West Allis, Wisconsin. The remedial system described in the Remedial Design Report (GAS, 1996) prepared for the above referenced site by Graef, Anhalt, Schloemer and Associates (GAS) was implemented and has been operating since April, 1997. In brief, the remedial system was designed to address groundwater contamination associated with two commingled groundwater contaminant plumes; one resulting from an underground gasoline storage tank and the other resulting from chlorinated solvents of uncertain origin. The system consists of a tee-shaped recovery trench with a recovery sump (RW-1) at the cross of the tee (see Attachment 1 for a location map and remedial system layout). There is second recovery well that is located outside of the trench, several feet from the base of the tee (MW-1). This well is deeper than the recovery trench to recover a deeper zone of contaminated groundwater. Water pumped from the two wells is piped to the remediation building and is processed through a shallow tray air stripper. The treated water is then discharged to a storm sewer.

Influent and effluent samples were collected on a monthly basis since the onset of pumping (with the exception of September). Samples of the recovered water were collected from the discharge lines of both pumps. The results of these samplings are shown in table form in Attachment 2. Laboratory documentation can be found in Attachment 3. Graphic presentations of the detected contaminants over time were plotted for both wells and can be found in Attachment 2. Levels in MW-1 did not appear to have a trend. However, when total detected VOCs was graphed there appeared to be a downward trend (see Attachment 2). At RW-1 there were definite downward trends to the data, often decreasing by approximately an order of magnitude. The graph of the total VOC data shows a clear downward trend (see Attachment 2).

Air emissions were estimated using the influent sampling data from MW-1 and RW-1 and estimates of the total volume of water recovered. It was assumed that 100 percent of the

GRAEF
ANHALT
SCHLOEMER
and Associates Inc.

detected VOCs were volatilized by the air stripper (verified by the effluent sampling) and that the emission rate could be estimated from the chemical concentrations and total influent flows. Accordingly, a total mass was calculated and used to estimate an emission rate for the sampling period. The results of the calculations are presented at the bottom of the tables in Attachment 2. Emission levels for benzene, vinyl chloride and total VOCs were less than their respective limits.

Contaminant levels in the recovery trench and at MW-1 are decreasing in an approximately linear fashion. There has yet to be a tailing off of the recovery rate, or asymptotic trend to the recovery. As contaminant levels are still above regulatory limits, it is proposed that operation of the system be continued.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& Associates, Inc.

I. INTRODUCTION

Graef, Anhalt, Schloemer & Associates, Inc. (GAS) was retained by Pressed Steel Tank, Inc. to perform professional environmental services addressing the subsurface contamination detected during removal of one 1,000-gallon underground storage tank located at 1445 South 66th Street, West Allis, Wisconsin (Figure 1). The scope of site activities completed before this Remedial Action Option Report (RAOR) included removal of the 1,000-gallon underground storage tank and three sets of soil borings/monitoring wells. The first set of monitoring wells, MW-1A, MW-2A and MW-3A, were installed in April, 1990. The two other sets of wells were installed in May, 1991 (MW-4, MW-5 and MW-6) and December, 1992 (MW-7, MW-8, MW-9, MW-10, MW-1C and MW-1P).

A. Site History and Existing Conditions

Seamless Structural Company was organized into Pressed Steel Tank, Inc. by Robert Henry Hackney and has manufactured steel tanks and various foundry products for over 90 years. There were two underground storage tanks that were used for storage and dispensing of petroleum product on the site.

A 1,000-gallon underground storage tank was located at the northwest corner of South 66th Street and West National Avenue. The age of the tank was unknown; however, it was reported to be older than 30 years. The 1,000-gallon tank, which was removed September 19, 1989, was used as a source of gasoline for in-plant trucks. The tank reportedly contained only gasoline. No records of inventory or periods of non-operation are available. The tank was never leak tested, repaired or replaced.

B. Regulatory Status

The site was classified by the Wisconsin Department of Natural Resources as being regulated under Wisconsin Statute 144.76(3), or the "spills law." Petroleum related hazardous materials in the soils and groundwater at the site are being managed as special waste. The site is a LUST site and the former UST is registered. The site is eligible for Petroleum Environmental Cleanup Fund Act (PECFA) participation, and has been involved in the PECFA program since 1989.

FIGURE 1

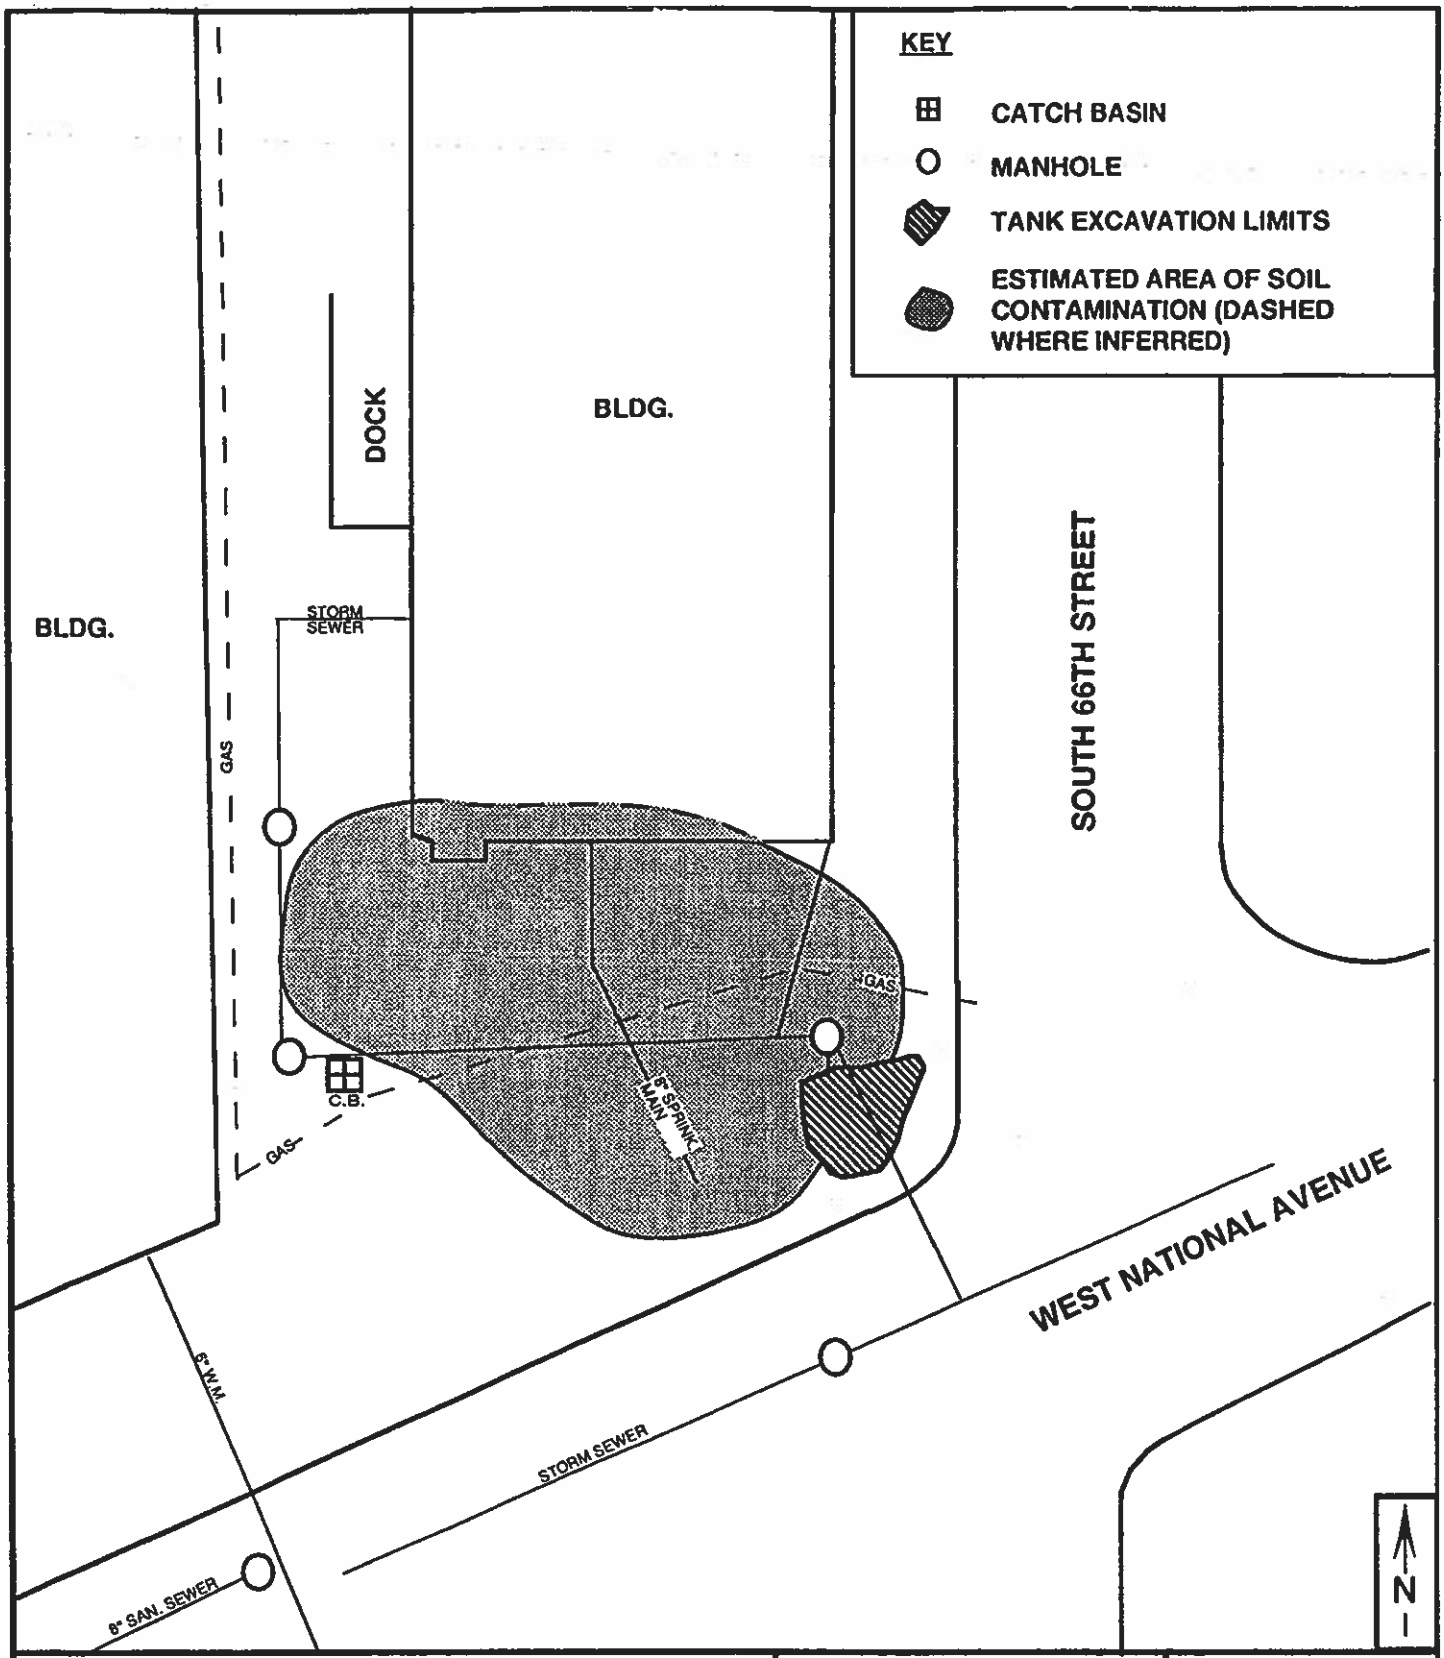
The Wisconsin Department of Natural Resources (WDNR) was contacted on February 1, 1995, regarding the ranking of the site into either high, medium or low priority. The site had not yet been ranked, however based on WDNR familiarity with the site it would not be ranked in the high category. As such, the WDNR will not be actively participating in management of the remainder of the project.

In accordance with the requirements of NR 720.09(1) wherein the procedures for applying generic soil Residual Contaminant Levels (RCLs) are described, the pertinent site characteristics can be described as follows: (i) contamination in the site soils is gasoline range organics (GRO); (ii) the horizontal and vertical degree and extent of contamination have been defined and are summarized below; (iii) the depth to carbonate bedrock is approximately 140 feet below ground surface (bgs); (iv) the thickness of the contaminated soils is approximately ten feet; and (v) none of the contaminants are known to facilitate transport or to have cosolvent effects. The RCLs for specific compounds as specified in NR 720.09(3)(a) are 5.5 parts per billion (ppb) for benzene, 2,900 ppb for ethylbenzene, 1,500 ppb for toluene, and 4,100 ppb for total xylenes. The geometric mean of the hydraulic conductivity measurements at the site is 1.1×10^{-5} cm/s. As specified in NR 720.09(4) for sites with a hydraulic conductivity of greater than 1×10^{-6} cm/s, the cleanup objective would then be 100 parts per million (ppm) for GRO contamination.

C. Nature and Extent of Contamination

The extent of petroleum related soil contamination was defined at the site by several rounds of soil boring investigations. The extent was defined to the west by the borehole for MW-5, which was clean. To the northwest the extent was defined between SB-4 that was contaminated at 470 ppm total petroleum hydrocarbons (TPH) and SB-8, which was clean. To the north the extent was defined between SB-2 that was contaminated at 550 ppm TPH and SB-9, which was clean. In the area of the tank excavation, SB-10 was contaminated at 92 ppm GRO, 400 ppb benzene, 4,000 ppb ethylbenzene, 2,700 ppb toluene, and 15,000 xylenes. No contamination was encountered west of SB-10 in the borehole for MW-8 or to the south in the borehole for MW-7. The sample collected from five feet into the eastern wall of the tank excavation (underneath the sidewalk adjacent to South 66th Street) had 100 ppm TPH (Figure 2).

Groundwater samples from three monitoring wells, MW-1, MW-1C and MW-2, indicated detects of petroleum related contamination exceeding WDNR regulatory limits. The extent of



EXTENT OF PETROLEUM CONTAMINATED SOIL

FIGURE 2

petroleum related groundwater contamination is defined by clean wells to the north at MW-9, to the northwest by MW-5, to the west by MW-8, to the south by MW-7, to the southeast by MW-4 and MW-6 and to the east by MW-3 and MW-10. The vertical extent is defined by the deep piezometer MW-1P. Based on laboratory results, the extent of petroleum related groundwater contamination is illustrated in Figure 3.

D. Geologic and Hydrogeologic Characteristics

The sediments encountered during remedial investigation at the site ranged in texture from clays to sands. Sands were encountered adjacent to the loading dock extending from the surface to 11 feet below ground surface (bgs). Sands were also encountered below the parking lot at the northeast corner of South 66th Street and West National Avenue from 17 to 24 feet bgs. It is not known if the sands at the loading dock are continuously connected to the sands below the parking lot. All other sampled locations had sandy clays, silty clays or clays. Sandy soils are typically more amenable to remediation by common technologies such as soil vapor extraction and groundwater pump and treat. It is also anticipated that the higher permeability soils would be remediated more quickly than the lower permeability clayey soils.

The site is located in an industrial area and as such the on-site and adjacent paved and developed areas limit recharge to the shallow groundwater. Groundwater was encountered on the site at one to seven feet bgs. At two monitoring wells, MW-2A and MW-3A, the water table is located within sand; whereas, at all other investigated locations, the water table is located in clay. Groundwater flow is to the south and east. The horizontal gradient of the water table ranges from approximately 0.01 to 0.07 ft/ft. The vertical gradient was measured at the MW-1 well nest. The gradient between MW-1C and MW-1A is 0.039 ft/ft downward and is 0.77 ft/ft downward between MW-1C and MW-1P.

II. REMEDIAL ACTION OPTIONS

In accordance with the requirement of NR 722.07(2), which requires a preliminary screening of remedial options, several methods of remediating the site were considered. Neither air sparging or soil vapor extraction will be considered as a possible option because of the low site hydraulic conductivity.

FIGURE 3

A. Soil Excavation and Groundwater Recovery from Sumps

A possible remedial alternative is excavation of the petroleum contaminated soils below the loading dock. Soils would be excavated to the 100 ppm GRO limit or to the extent practicable, given the limits imposed by the presence of the building to the north, South 66th Street to the east , National Avenue to the south and the various utility lines that transect the impacted area. The base of the excavation would be graded to drain into a sump pit. A large diameter screened PVC pipe would be installed in the pit to allow for draining of the excavation.

After contaminated soils are removed and the floor graded, the excavation would be backfilled with granular material and compacted. The granular material would allow for groundwater recovery from the adjacent contaminated soils below the building and along the utilities. The excavated soil could be either landfilled in a Subtitle D approved landfill.

Groundwater would be either pumped on a quarterly interval using level switches in the sump. The pumped groundwater would be either treated and discharged to a storm sewer or treated and discharged to a sanitary sewer.

The above remedial action would comply with the requirements of NR 722.09(2); which requires that the remedial alternative restores the environment, to the extent practical; and minimizes harmful effects to the air, lands and waters. The above treatment alternative would remove the remaining accessible contaminated soils to the applicable NR 720 standard, and thus remove the significant sources of future groundwater contamination. Excavation would continue below the water table in the low conductivity sediments, which would result in removal of contaminated groundwater exceeding the NR 140 groundwater quality standard.

The groundwater recovery system performance would be monitored quarterly to determine if the groundwater quality levels are approaching NR 140 cleanup objectives. Should the groundwater quality levels plateau above the NR 140 cleanup objectives, based on four quarters of data, the system configuration / operation would be re-evaluated.

The volume of contaminated soils is estimated at 1,110 cubic yards (cy). As this is less than the 2,000 cy limit requiring WDNR approval per NR 722.09(4)(b)2, WDNR approval would not be necessary. Landfill approval of the waste stream would be required. A WDNR

Bureau of Air Management Form 4400-120 (Application to Treat or Dispose of Petroleum Contaminated Soil) would have to be filed. A Wisconsin Pollution Discharge Elimination System (WPDES) permit from the WDNR would be required for the groundwater treatment system effluent to a storm sewer. As would permission from the Milwaukee Metropolitan Sewerage District (MMSD) to discharge to a sanitary sewer.

B. Passive Bioremediation of Soils and Groundwater Recovery from Wells

A possible remedial alternative is passive/active bioremediation of the soil contamination and groundwater pump and treat from several closely spaced wells. Progress of the soil remediation would be monitored on a yearly basis by collecting a soil sample for GRO and bioenumeration analyses. If soil contamination does not appear to be cleaning up, based on two successive sampling events, amendments of site nutrients would be evaluated for implementation. Groundwater recovery wells could alternatively switched off from a pumping mode and operated in an infiltration mode to deliver nutrients to the site to expedite bioremediation of the soils.

The above remedial action would comply with the requirements of NR 722.09 (2); which requires that the remedial alternative restores the environment, to the extent practicable; and minimizes harmful effects to the air, lands and waters. The soil contamination level would be monitored to verify that levels are approaching the applicable NR 720 standard.

The groundwater recovery system performance would be monitored quarterly to determine if the groundwater quality levels are approaching NR 140 cleanup objectives. Should the groundwater quality levels plateau above the NR 140 cleanup objectives, based on four quarters of data, the system configuration/operation would be re-evaluated.

Contaminated soils excavated during well installation and remedial system installation (connection trenches) are anticipated to total to less than the NR 722.07(3)(b)1 of 250 cy. As such, these soils could be landfilled without detailed evaluation of alternative remedial options. Landfill approval of the waste stream would be required. A WDNR Bureau of Air Management Form 4400-120 (Application to Treat or Dispose of Petroleum Contaminated Soil) would have to be filed. A WPDES permit from the WDNR would be required for the groundwater treatment system effluent to a storm sewer. As would permission from the MMSD to discharge to a sanitary sewer. As this project is a PECFA project, it will be

necessary to obtain approval for the Remedial Action Option Report from DILHR as per ILHR 47.33(1)(c).

C. Passive / Active Bioremediation of Soils and Groundwater Recovery from Trenches

The remedial option identified during the Remedial Investigation / Feasibility Study as the recommended alternative was monitoring of passive/active bioremediation of soil contamination with evaluation after one year to determine if site nutrients need to be amended to expedite soil remediation, and groundwater recovery from a series of trenches.

Progress of the soil remediation would be monitored by collecting soil samples annually. The samples would be analyzed for GRO, petroleum volatile organic compounds (PVOCs), enumeration of total heterotrophs, and enumeration of total degraders. If significant reduction of contamination is not observed, site nutrient conditions would be evaluated and amended. Nutrients could be infiltrated through the groundwater recovery trenches (after a cessation of pumping) and in site monitoring wells.

Groundwater trenches would be connected and sloped to a common sump (Figure 4). The sump would consist of a section of large diameter slotted PVC piping. A low flow, explosion proof groundwater pump would be placed in the sump to recover in-flowing groundwater. Level switches in the sump would be used to control cycling of the recovery pump. If technically and economically feasible, monitoring well MW-1A (two-inch diameter) would be retrofitted with a pump to capture deeper groundwater contamination observed in the vicinity of MW-1A. Otherwise, a standard four-inch diameter well would be constructed to replace MW-1A and be used as a recovery well.

The pumped groundwater would either be treated and discharged to a storm sewer or treated and discharged to a sanitary sewer. The groundwater recovery system would be operated continuously. The performance would be monitored quarterly to determine if the groundwater quality levels are approaching NR 140 cleanup objectives. Should the groundwater quality levels plateau above the NR 140 cleanup objectives based on four quarters of data, the system configuration/operation would be re-evaluated.

FIGURE 4

Contaminated soils excavated of groundwater recovery trenches and remedial system installation are anticipated to total less than the NR 722.07(3)(b)1 of 250 cy. As such, these soils could be landfilled without detailed evaluation of alternative remedial options. Landfill approval of the waste stream would be required. A WDNR Bureau of Air Management Form 4400-120 (Application to Treat or Dispose of Petroleum Contaminated Soil) would have to be filed. A WPDES permit from the WDNR would be required for the groundwater treatment system effluent and permission from the MMSD to discharge to a sanitary sewer. This being a PECFA project, it will be necessary to obtain approval for the Remedial Action Option Report from DILHR as per ILHR 47.33(1)(c).

D. Passive Bioremediation of Soils and Groundwater

Consideration of passive bioremediation as a remedial option is required at sites where the remedial investigation began after January 15, 1993 per ILHR 47.335(3)(a). The remedial investigation at this site began in 1990. Therefore, passive bioremediation is not required to be evaluated as a remedial option. Also, NR 722.07 notes that remedial options that are not suitable for a site need not be considered. The high levels of petroleum contamination in site groundwater vitiate the applicability of passive bioremediation of all site contamination. Therefor this option will not be considered further.

III. SELECTED REMEDIAL OPTION

A. General Description

The remedial action selected from those described above is passive/active bioremediation of soil contamination and groundwater recovery and treatment using recovery trenches. This action was chosen because of the comparative simplicity over the other actions. This option is the least costly of the three evaluated optoins, assuming groundwater remediation would require five years to accomplish. The trenching option would cost $366,855 after five years, the groundwater recovery well option would cost $423,612 after five years, and the soil excavation and groundwater pumping would cost $403,413 after five years (Appendix A).

B. Site Safety Plan

The contractor will be required to prepare a site safety plan for its personnel and specifically designed for the Pressed Steel site. A separate safety plan specific to the site will be prepared by GAS for its on-site personnel.

C. Contingencies

In the event water enters the excavation due to rain or other unforeseen circumstances, a contingency plan will be made by the contractor for the removal, treatment, and disposal of the water. Any water removed for treatment must be handled according to local, state, and federal regulations.

D. Remedial Action Implementation

As stated in Chapter NR 724, a remedial design report is to be prepared prior to the development of the remedial system construction plans and specifications. These two items are now being developed concurrently. Following development of the remedial system construction plans and specifications a bid package will be submitted to qualified contractors. A minimum of three quotes will then be obtained from qualified contractors. The selected contractor is expected to have the ability to complete the specified work in a timely and cost-effective manner and within WDNR regulations.

E. Monitoring Plan / Performance Measurement

In order to determine the effectiveness of the system, a soil and groundwater monitoring plan will be implemented.

1. Soil Monitoring

One soil sample will be collected annually near the loading dock as shown on Figure 4, and submitted to a WDNR-certified laboratory for analysis of GRO and PVOCs in accordance with WDNR published guidelines. A Geoprobe hollow drill rod will be hydraulically driven to the desired depth and then retracted to obtain the sample. This method is less intrusive than standard hollow / solid stem auger techniques.

2. Groundwater Monitoring

Monitoring wells MW-1A, MW-1C, MW-1P, MW-2A, MW-3A, MW-4, and MW-7 will be sampled semi-annually per published WDNR guidelines until contaminant levels in all the wells are below their respective NR 140 enforcement standards. The wells will then be

sampled semi-annually for an additional year to demonstrate compliance with NR 140 enforcement standards.

The collected groundwater samples will be submitted to a WDNR-certified laboratory for analysis of GRO and PVOCs.

3. System Performance Measurement

GAS will sample the influent and effluent streams of the system weekly for the first four weeks and then biweekly for a minimum of three months. A reduction in sampling frequency may be requested at that time. Sample parameters will be GRO and selected VOCs.

F. Report Preparation

A case closure report will be prepared that discusses the results of the remedial site activities. The report will provide a discussion summarizing remedial activities and make specific recommendations regarding the site's environmental conditions relative to site closure. The report appendices will include completed WDNR required forms, photographs of pertinent site activities, laboratory reports, and field screening logs as required under Chapter NR 726 regarding case closure.

I. INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was retained by Pressed Steel Tank, Inc. to perform professional environmental services to address the subsurface contamination detected during removal of one 1,000-gallon underground storage tank located at 1445 South 66th Street, West Allis Wisconsin (Figure 1). The scope of site activities completed before this Remedial Investigation/Feasibility Study (RI/FS) included removal of the 1,000-gallon underground storage tank and three sets of soil borings/monitoring wells. The first set of monitoring wells, MW-1A, MW-2A and MW-3A, were installed in April, 1990. The two other sets of wells was installed in May 1991 and December 1992.

A. Site History and Existing Conditions

Seamless Structural Company was organized into Pressed Steel Tank, Inc. by Robert Henry Hackney and has manufactured steel tanks and various foundry products for over 90 years.

A 1,000 gallon underground storage tank was located at the northwest corner of South 66th Street and West National Avenue. The age of the tank was unknown, however, it was reported to be older than 30 years. The 1,000-gallon tank, which was removed September 19, 1989, was used as a source of gasoline for in-plant trucks. The tank reportedly contained only gasoline. No records of inventory or periods of non-operation are available. The tank was never leak tested, repaired or replaced.

B. Geology and Hydrogeology

The basic geology of southeastern Wisconsin is reasonably uniform. Above the Precambrian crystalline basement (older than 570 million years), the rock units are slightly inclined sedimentary strata deposited in marine environments between 505 million and 350 million years old. The bedrock is capped by more than 300 feet of glacial sediments deposited primarily by the Lake Michigan Lobe of several stages of continental glaciation during the Pleistocene Epoch. Post-glacial processes have eroded and developed soils in the glacial deposits and exposed bedrock.

1. Soils

Soils in the Pressed Steel Tank, Inc. project area are part of the Ozaukee-Morley-Mequon Association. These soils develop in thin layers of loess (wind transported silty sediments) over silty clay loam glacial till. The site occurs outside the area of detailed soils series mapping. However the original site soils were probably silty clay loams developed in glacial tills.

The soils encountered at the site ranged in texture from clays to sands. Sands were encountered adjacent to the loading dock extending from the surface to 11 feet below ground surface (bgs). Sands were also encountered below the parking lot at the northeast corner of South 66th Street and West National Avenue from 17 to 24 feet bgs. It is not known if the sands at the loading dock are continuously connected to the sands below the parking lot. All other sampled locations had sandy clays, silty clays or clays. Sandy soils are typically more amenable to remediation by technologies such as soil vapor extraction and groundwater pump and treat. It is also anticipated that the higher permeability soils would be remediated more quickly than the lower permeability clayey soils.

A groundwater recovery well was planned to be installed adjacent to MW-2 in order to recover groundwater from the more permeable sediments encountered in the borehole for MW-2. Soils encountered in the recovery well borehole were similar to those in the MW-2 borehole.

2. Glacial Geology

The landforms and surface deposits of Milwaukee County are, for the most part, a result of glaciations during the Woodfordian phase of the Late Wisconsinan Stage (Pleistocene Series time period). A series of recessional moraines, formed by the Lake Michigan Lobe, occur in north-trending ridges throughout the county (Figure 2). Deposits are predominantly tills (mixtures of clay, silt, sand and rocks resulting from the erosion, attrition and transport of geological materials by glacial ice) with minor amounts of outwash (sediments transported and deposited by glacial meltwaters) in the north, east and south-central part of the county. The estimated thickness of glacial deposits at the site is 140 feet, based on water well contractor construction reports.

FIGURE 2

The project site is located in the west-central section of Milwaukee County within the Lake Boarder Moraine System. As such, a complex suite of sediments were expected, ranging from glacial tills, to glacial outwash, to proglacial lacustrine deposits (fine grained sediments deposited in lakes along a glacier. The deposits at the site were interpreted as glacial till, Oak Creek Formation, based on inspection of samples obtained from boreholes, borehole logs and existing maps. The nature of the sandy sediments at the site is unknown. No evidence was observed to indicate that the sandy sediments were fluvial (river), glacial outwash or strand line deposits (beach environment).

A water well contractor construction report for a supply well at the project site indicated that there was clay from 0 to 66 feet below ground surface (bgs), shale [sic] from 66 to 73 feet bgs, sandy clay from 73 to 95 feet bgs and sand and gravel from 95 to 111 feet bgs. A shale boulder may have occurred at 66 feet bgs, but it is not very probable that there would be a seven foot thick shale boulder in glacial sediments, given the soft nature of most shales. A well located to the southeast at 1737 South 64th Street was originally completed at 67 feet bgs, an indication that a coarser-grained water-bearing unit occurred at this depth. There was probability a weathered gravel deposit where the shale was logged. Other well logs for the project area indicate that the first coarse-grained water bearing unit occurs from 60 to 70 feet bgs. Because of the depth to this unit it is unlikely that contamination encountered to date at the water table has impacted this water bearing unit.

Well logs for the project area indicate that there is between 50 to 70 feet of clayey sediments between the above mentioned coarser-grained unit and dolomite bedrock. These sediments are probably glacial tills (New Berlin and possibly Tiskilwa Formations). Such a thickness of sediments makes it very unlikely that the dolomite aquifer would be affected by contamination in the shallow saturated sediments at the site.

3. Bedrock Geology

The uppermost bedrock units of Milwaukee County are nearly horizontally-bedded sedimentary strata. The northeastern one-seventh of the county is Devonian System dolomites and shales of the Milwaukee Formation (Figure 3). Underlying the Milwaukee Formation and occurring as the uppermost unit in the remaining six-sevenths is Silurian System dolomite (Niagara Formation). The bedrock underlying the Silurian System dolomite are rock units ranging in age from Precambrian through Ordovician Age. In

general, the sedimentary units dip gently to the east toward the Michigan Basin. From the oldest (deepest) to the youngest, the rock units are: Precambrian crystalline rocks, Cambrian sandstones (Mount Simon, Eau Claire, Galesville and Franconia sandstones) and Ordovician sandstones, dolomites and shales (Prairie du Chien Dolomite, St. Peter Sandstone, Platteville, Decora, and Galena Dolomites, Maquoketa and Neda Shales). Bedrock at the site occurs at approximately 140 feet below ground surface.

The Niagara dolomite, where saturated, is the upper bedrock aquifer unit. The Ordovician dolomites and Cambrian sandstones are the lower bedrock aquifer.

4. Groundwater

The site is located in an area where approximately 140 feet of unconsolidated sediments cover the upper bedrock aquifer. Because of the thickness of low conductivity sediments above the bedrock aquifer (at least eighty feet) and the total thickness of sediments (140 feet), it is doubtful that the bedrock aquifer will be affected.

The site is located in an industrial area and as such the paved and developed areas limit recharge to the groundwater table. Groundwater was encountered on the site at one to seven feet bgs. At two monitoring wells, MW-2 and MW-3, the water table is located within sand; whereas, at all other investigated locations, the water table is located in clay. Groundwater flow is to the south and east. The horizontal gradient of the water table ranges from approximately 0.01 to 0.07 ft/ft.

The vertical gradient was measured at the MW-1 well nest. The gradient between MW-1 and MW-1A is 0.039 ft/ft downward and is 0.77 ft/ft downward between MW-1C and MW-1P.

II. CONTINUING INVESTIGATION

A. Summary of Site Investigative Activities

1. Groundwater Sampling

On November 9 and 10, 1992, GAS personnel were on site to collect groundwater samples from existing monitoring wells installed during previous investigations, and to

establish current groundwater quality for comparison to data from previous sampling rounds. Previously installed monitoring wells MW-1A, MW-2A, MW-3A, MW-4, MW-5 and MW-6 were sampled in accordance with WDNR guidelines and the samples submitted to National Environmental Testing, Inc. (NET) for analysis of gasoline range organics (GRO) and volatile organic compounds (VOCs). Gasoline related compounds were detected only in well MW-2; GRO was detected at 53,000 ppb, ethylbenzene was detected at 7,200 ppb, toluene was detected at 2,800 ppb and xylenes were detected at 25,000 ppb. Previously xylenes were detected in MW-3, but none were detected in November, 1992 (Appendix B).

2. Soil Borings and Monitoring Wells

To define the extent of contamination, GAS personnel were on site on December 14, 15 and 16, 1992 to supervise drilling of six environmental boreholes and installation of five monitoring wells and one piezometer by Layne-Northwest (Figure 4). All six boreholes were converted to monitoring wells designated as MW-1C, MW-1P, and MW-7 through MW-10 (Appendices C and D). Monitoring well MW-1C was located to determine the shallow groundwater quality adjacent to the former tank location. Monitoring well MW-1P was drilled to determine the deep groundwater quality in the vicinity of MW-1A because of the previous GRO detection.

With the exception of the borehole for MW-P1, boreholes were sampled continuously using two foot long split-spoon soil samplers. The borehole for MW-P1 was blind drilled to the base of the interval sampled in the MW-1A borehole, 39 feet bgs, then sampled to a depth of 46 feet bgs for stratigraphic information and field screening purposes only.

3. Groundwater Monitoring

On October 27, 28 and November 3, 1993, GAS personnel were on site to collect groundwater samples. Monitoring wells MW-1, MW-1C, MW-1P, MW-2, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9 and MW-10 were sampled in accordance with WDNR guidelines and the samples submitted to National Environmental Testing, Inc. (NET) for analysis of GRO, petroleum volatile organic compounds (PVOC) and those VOCs detected during previous sampling events (GAS, *Workplan*, June 1993 and Appendix B). Samples were collected with disposable bailers using bottom emptying devices. Samples were placed in laboratory supplied containers with the appropriate

preservatives. Samples were stored on ice and sent to NET with chain-of-custody documentation.

B. Sampling Methods

1. Sampling Methods Used

The soil and groundwater sampling and preservation methods used were approved WDNR procedures current at the time of the investigation.

a. Soil Sampling

Soil samples were obtained from boreholes using two foot long split-barrel sampling devices (split spoons). The length of each sampling interval was two feet. Upon retrieval from a borehole the spoons were opened to reveal the sediment sample. A clean sampling tool was used to obtain an approximately 20-gram sample. The sample was immediately placed in a 40-ml VOA vial and sealed. The sample bottle was then placed on ice in a cooler. Another representative soil sample was then placed in an eight once jar, the jar sealed with aluminum foil and placed in a heated area to allow for volatilization. After the sample jar was warmed for at least 15 minutes, the head space of the sample was screened for VOCs with a photoionization detector. The interval blow count, length of sample recovered, geological nature of the sediments, Munsell color, Unified Soil Classification System (USCS) classification, estimated moisture content and volatile organic compound field screening detection (photoionization or flame ionization detector) were logged. After reviewing the field screening results for all samples from a boring, the samples that would be submitted to the laboratory were chosen. The chosen samples were then preserved by injecting 20 ml of reagent grade methanol through the septum of the sampling vial. The preserved samples were then returned to the cooler. Laboratory samples were sent to NET laboratory in Watertown, Wisconsin accompanied by chain-of-custody documentation.

b. Groundwater Sampling

Before groundwater samples were collected, the elevation of all site monitoring wells was measured to allow for determination of groundwater flow directions on the day samples were collected. If possible, monitoring wells were purged of four well casing volumes to

remove stagnant water. Monitoring wells were purged and sampled with new, clean disposable bailers. Samples collected for VOC and GRO analysis were obtained from bailers with bottom emptying devices and placed in 40 ml VOA vials. Samples were preserved with several drops of hydrochloric acid and carefully capped to avoid entrapping any air bubbles. Samples collected for lead analysis were obtained from bailers with bottom emptying devices and placed in a positive pressure pumping device. The samples were pumped through new, disposable, in-line, 45 micron filters. Samples were placed in 250 ml plastic bottles containing nitric acid as a preservative, placed on ice in a cooler and sent to NET laboratory in Watertown, Wisconsin accompanied by chain-of-custody documentation. The color, clarity, temperature, and conductivity of the samples were recorded in the field at the time of sampling.

2. Quality Assurance/Quality Control

Internal quality assurance/quality control documentation for the laboratory is available from NET. No duplicate soil samples were collected. Trip blanks were used during the last three rounds of groundwater sampling as a mechanism to test for background laboratory contamination. Trip blanks were prepared by NET, transported to the site and sent to the lab with the groundwater samples for analysis of the same parameters as the groundwater samples.

3. Field Screening

Soil sample field screening results ranged from 0.0 to 589 instrument units (IUs) (Table 1). The highest field screening readings occurred in boring SB-10, located approximately fifty feet west of the former tank location.

C. Analytical Results

1. Soil Sample Results of December 1992 Drilling Event

Soil samples submitted for laboratory analysis from soil borings SB-10/MW-1C, SB-11/MW-7, SB-12/MW-8, SB-13/MW-9 and SB-14/MW-10 were analyzed for GRO, PVOC and lead. See Table 2 and Appendix C for analytical results.

960519.TBL SOILS1

MTBE = Methyl Tertiary Butyl Ether
GRO = Gasoline Range Organics
TMB = Trimethylbenzene

Analytical results for the soil sample from SB-10 at 7 to 9 feet bgs indicated GRO at 92 parts per million (ppm) and the following PVOC constituents: benzene at 0.4 ppm, ethylbenzene at 4.0 ppm, methyl-tert-butyl-ether (MTBE) at 0.4 ppm, toluene at 2.7 ppm, 1,2,4-trimethylbenzene at 7.1 ppm, 1,3,5-trimethylbenzene at 2.1 ppm and total xylenes at 15 ppm. Lead was detected at 8.0 ppm.

Results for the soil sample from SB-10 at 11 to 13 feet bgs indicated GRO was below the laboratory detection limit of 5.0 ppm (< 5.0 ppm). Only one PVOC constituent, benzene at 0.2 ppm, was detected above the laboratory detection limit of 0.1 ppm. Ethylbenzene, MTBE, toluene, 1,2,4-trimethylbenzene and 1,3,5-trimethylbenzene were all below the laboratory detection limit of 0.1 ppm, and total xylenes were below the laboratory detection limit of 0.3 ppm. Lead was detected at 7.0 ppm.

Analytical results for both samples from soil boring SB-11 (7 to 9 feet bgs and 11 to 13 feet bgs) indicated GRO and all PVOC constituents were below laboratory detection limits. However, lead was detected in both samples at 8.0 ppm.

Analytical results for both samples from soil boring SB-12 (7 to 9 feet bgs and 11 to 13 feet bgs) indicated GRO and all PVOC constituents to be below laboratory detection limits. However, lead was detected in the 7 to 9 feet bgs sample at 46.0 ppm and in the 11 to 13 feet bgs sample at 8.0 ppm.

The results for both samples from soil boring SB-13 (3 to 5 feet bgs and 13 to 15 feet bgs) indicated GRO and all PVOC constituents were below laboratory detection limits. Lead was detected in the 3 to 5 feet bgs sample at 10.0 ppm and in the 13 to 15 feet bgs sample at 8.0 ppm.

Analytical results for both samples from soil boring SB-14 (9 to 11 feet bgs and 13 to 15 feet bgs) indicated GRO and all PVOC constituents were below laboratory detection limits. Lead was detected in the 9 to 11 feet bgs sample at 7.0 ppm and in the 13 to 15 feet bgs sample at 8.0 ppm.

The WDNR cleanup guidance was 10 ppm GRO; however, cleanup standards, NR 720, are currently being promulgated. As of February 15, 1994, the cleanup levels being developed had levels for BTEX, 1,2-dichloroethane and lead, in addition to GRO. The standards are 5.5, 1,500, 2,900, 4,100 and 4.9 ppb for BTEX and 1,2-dichloroethane, and

500 ppm for lead in an industrial area. Exceedances occur in SB-10 from 7 to 9 feet bgs for the four BTEX compounds and from 11 to 13 feet bgs for benzene.

2. Groundwater Results

a. Results of the November, 1992 Groundwater Sampling Event

Groundwater samples submitted for laboratory analysis from monitoring wells MW-1A, MW-2A, MW-3A, MW-4, MW-5 and MW-6 were analyzed for GRO and volatile organic compounds (VOC) (Table 3 and Appendix B).

Analytical results for the groundwater samples from MW-1A indicated GRO at 100 parts per billion (ppb). Four VOC constituents were detected above laboratory detection limits: cis-1,2-dichloroethene at 260.0 ppb, which is above the WDNR Enforcement Standard (ES) of 70 ppb; trans-1,2-dichloroethene at 10.0 ppb, which is below the WDNR Preventive Action Limit (PAL); trichloroethene at 96.0 ppb, which is above the WDNR ES of 5.0 ppb; and vinyl chloride at 120.0 ppb, which is above the WDNR ES of 0.2 ppb.

Results for MW-2A indicated GRO at 53,000 ppb, and detects of eight VOC constituents: n-butylbenzene at 180 ppb (no current standard); ethylbenzene at 7,200 ppb (above the ES of 700 ppb); isopropylbenzene at 110 ppb (no current standard), naphthalene at 1,400 ppb (above the ES of 40 ppb); toluene at 2,800 ppb (above the ES of 343 ppb); 1,2,4-trimethylbenzene at 810 ppb (no current standard); 1,3,5-trimethylbenzene at 440 ppb (no current standard); and total xylenes at 25,000 ppb (above the ES of 620 ppb).

Analytical results for wells MW-3, MW-4 and MW-6 indicated there were no detects of GRO or VOCs in samples from these three wells.

Results for MW-5 indicated six detects of VOC constituents: 1,1-dichloroethane at 2.9 ppb (below the PAL of 85 ppb); 1,1-dichloroethene at 1.3 ppb (above the PAL of 0.7 ppb); cis-1,2-dichloroethene at 8.4 ppb (above the PAL of 7.0 ppb); trans-1,2-dichloroethene at 1.9 ppb (below the PALof 20 ppb); trichloroethene at 56 ppb (above the ES of 5.0 ppb); and vinyl chloride at 26 ppb (above the ES of 0.2 ppb).

SRS\R TBL GWCONTAM

b. Results of December, 1992 and January, 1993 Sampling Event of Wells Installed in December, 1992

Groundwater samples submitted for laboratory analysis from monitoring wells MW-1P, MW-1C, MW-7, MW-8, MW-9 and MW-10 were analyzed for GRO, VOCs and lead (Table 3 and Appendix E).

Analytical results for groundwater samples from MW-1P, MW-8 and MW-9 all indicated there were no detects of GRO, VOCs, or lead from any of these wells.

Results of MW-1C indicated GRO at 1,700 ppb and detects of twelve VOC constituents. The detected VOCs are as follows: benzene at 120 ppb (above the ES of 5.0 ppb); chloroform at 36 ppb (above the ES of 6.0 ppb); cis-1,2-dichloroethene at 460 ppb (above the ES of 70 ppb); naphthalene at 20 ppb (above the PAL of 8 ppb); toluene at 110 ppb (above the PAL of 68.6 ppb); trichloroethene at 560 ppb (above the ES of 5.0 ppb); vinyl chloride at 810 ppb (above the ES of 0.2 ppb); and total xylenes at 310 ppb (above the PAL of 124 ppb). Lead was below laboratory detection limits.

Analytical results of MW-7 indicated there were no detects of GRO or lead and only one detect of a VOC constituent, naphthalene at 2.4 ppb (which is below the PAL of 8 ppb).

Results of MW-10 indicated one detect of a VOC constituent, toluene at 1.2 ppb (which is below the PAL of 69 ppb), and no detects of GRO or lead.

c. Results of October and November, 1993 Confirmation Sampling Event at All Wells

Groundwater samples submitted for laboratory analyses for this sampling event included samples from MW-1, MW-1P, MW-1C and MW-2 through MW-10. Samples for these wells were analyzed for GRO, PVOC and specific VOC compounds detected in previous sampling events as shown in Table 3 and Appendix E.

The results of MW-1 indicated GRO at 140 ppb and the detection of seven VOC constituents: benzene at 1.5 ppb (above the PAL of 0.5 ppb); cis-1,2-dichloroethene at 330 ppb (above the ES of 70 ppb); trans-1,2-dichloroethene at 18 ppb (below the PAL); ethylbenzene at 1.3 (below the PAL of 140 ppb); toluene at 1.3 ppb (below the PALof 68.6

ppb); trichloroethene at 120 ppb (above the ES of 5 ppb); and vinyl chloride at 150 ppb (above the ES of 0.2 ppb).

Analytical results for MW-1C indicated a detect of GRO at 1,600 ppb, and eleven detects of VOC constituents: benzene at 160 ppb (above the ES of 5 ppb); cis-1,2-dichloroethene at 740 ppb (above the ES of 70 ppb); trans-1,2-dichloroethene at 30 ppb (above the PAL of 20 ppb); ethylbenzene at 240 ppb (above the PAL of 140 ppb), naphthalene at 11 ppb (above the PAL of 8 ppb); toluene at 72 ppb (above the PAL of 68.6 ppb); trichloroethene at 380 ppb (above the ES of 5 ppb); 1,2,4-trimethylbenzene at 17 ppb (no current standard); 1,3,5-trimethylbenzene at 5 ppb (no current standard); vinyl chloride at 870 ppb (above the ES of 0.2 ppb); and total xylenes at 600 ppb (above the PAL of 124 ppb).

Results for MW-2 indicated GRO at 36,000 ppb and seven detects of VOC constituents: benzene at 15 ppb (above the ES of 5 ppb); ethylbenzene at 5,500 ppb (above the ES of 700 ppb); naphthalene at 770 ppb (above the ES of 40 ppb); toluene at 710 ppb (above the ES of 343 ppb); 1,2,4-trimethylbenzene at 850 ppb (no current standard); 1,3,5-trimethylbenzene at 190 ppb (no current standard); and total xylenes at 22,000 ppb (above the ES of 620 ppb).

Analytical results for MW-5 indicated there were no detects of GRO or lead and three detects of VOC constituents: 1,1-dichloroethane at 2.0 ppb (below the PAL of 85 ppb); cis-1,2-dichloroethene at 9.1 ppb (below the PAL); and trichloroethene at 34 ppb (above the ES of 5 ppb).

The analytical results for wells MW-1P, MW-3, MW-4 and MW-6 through MW-10 all indicated there were no detects of GRO, VOCs or lead from any of these wells.

D. Discussion of Continued Investigation Results

1. Extent of Soil Contamination

Based on laboratory results for this phase of investigation, petroleum related soil contamination exceeding WDNR regulatory limits were detected only in SB-10/MW-1C. Soil boring SB-10/MW-1C is located adjacent to the former tank location to the southwest, within the previously determined, limited area for extent of gasoline contaminated soil, as illustrated on Figure 5.

FIGURE 5

2. Extent of Groundwater Contamination

Based on laboratory results, the extent of petroleum related groundwater contamination is illustrated in Figure 6. Groundwater samples from three monitoring wells, MW-1, MW-1C and MW-2, indicated detects of petroleum related contamination exceeding WDNR regulatory limits. Other various VOCs were also detected in these wells and in MW-5; however, these VOCs are probably not related to the use of the former petroleum tank system. Table 3 summarizes the analytical results of groundwater samples from all the monitoring wells.

E. Difficulties Encountered

On December 17, 1992 when GAS personnel were on site to develop monitoring wells MW-8, MW-9 and MW-1P1 the wells contained no water. Distilled water was added to the wells to clean out the screened section possibly clogged during installation. Five gallons were added to MW-9 and MW-1P1 and four gallons to MW-8. The wells were surged with a bailer then purged dry. On January 6, 1993 the three wells were checked and all three contained water. Well MW-8 contained 2.5 gallons, MW-9 contained two gallons and MW-1P1 contained 7.5 gallons. The wells were again purged dry. On January 11, 1993 the three wells were checked again and all three wells again had water. The wells were sampled without purging because of the small volumes of water produced by these wells.

Recovery well RW-1 was installed on August 2, 1993. At that time the water level in the well was 25.30 ft below the measuring point on the well (the measuring point is located approximately one foot below grade). The depth to the water table in well MW-2, located 3.5 feet to the east is approximately 2 feet bgs. The upper ten feet of sediment at RW-1 are sands. Accordingly, it was felt that the borehole was "smeared" during drilling; the clays from the bottom 17 feet of the borehole coated the wall of the borehole with a layer of clay as the augers transported the clays to the surface.

Based on recommendations made by WDNR personnel, arrangements were made to continue well development utilizing dry ice as a source of gas to pressurize the well. It was felt that the gas pressure would disperse the smeared clay on the borehole wall. On August 24, the well was pressurized to 40 psi and allowed to degas slowly. The well was pressurized to 60 psi and again allowed to de-gas slowly. On August 26, 1993, the hydraulic conductivity of the well was estimated at 9.8 E-5 ft/min. The hydraulic

FIGURE 6

conductivity increased by a factor of ten over the previous measurement. On September 8, 1993, the well was surged for one hour, bailed down and the recovery recorded. The hydraulic conductivity was subsequently estimated at 1.4 E-5 ft/min.

On October 5, 1993, the recovery well was bailed and the recovery recorded. The hydraulic conductivity was estimated at 8.7 E-6 ft/min. The conductivity had decreased by a factor of almost two. On October 6, 1993 the well was again bailed down in an attempt to develop the fines out of the filter pack and well screen. The hydraulic conductivity was estimated at 9.2 E-6 ft/min, slightly greater than the previous estimate (Appendix F).

III. FEASIBILITY TESTING

A. Methods

1. Biological Testing

On August 2, 1993, GAS personnel were on site to collect soil samples for bioenumeration analysis. As outlined in the GAS Workplan for remedial feasibility testing, six soil samples were collected (Figure 7). Samples were collected from zones of high, medium and low contamination levels. These samples were collected from both of the two general soil textures present at the site (clayey and sandy soils).

Samples were collected using aseptic techniques recommended by BioRenewal Technologies (Appendix G). Soil samples were placed in sterile four-ounce glass jars and stored on ice. Samples were sent to BioRenewal Technologies, Inc. in Madison, Wisconsin.

On August 18, 1993, GAS personnel were on site to collect groundwater samples for bioenumeration analysis. As outlined in the GAS Workplan for remedial feasibility testing, three groundwater samples were collected (Figure 7) Samples were collected from zones of high, medium and low contamination levels.

Groundwater samples were collected with new, disposable bailers. Two clean, sterile 40-ml VOA vials were collected from each sampled well. Samples were stored on ice and sent to BioRenewal Technologies, Inc. in Madison, Wisconsin.

FIGURE 7

2. Groundwater Pump Testing

Based on the boring logs for monitoring well MW-2 which indicated that sediments were sandy for approximately the upper ten feet, it was felt that a well screened through the sands would produce appreciable volumes of water. Accordingly, a pump test was planned to determine the potential flow rate and radius of influence. After evaluating the results of the groundwater bail down testing performed in conjunction with recovery well developing by screening level groundwater modeling, groundwater pumping from a single well or series of wells was eliminated as an option for groundwater extraction. The groundwater pump testing was eliminated from the remedial feasibility testing. However, screening level groundwater modeling was used to explore the feasibility of groundwater extraction and remediation using trenches (Figure 8 and Appendix H).

3. Soil Vapor Extraction Testing

The results of the groundwater bail down testing performed in conjunction with recovery well developing were converted to intrinsic permeability. The permeability of the soil was estimated at 1.0 E-10 cm^2 which was considered to be too low, one hundred times lower than the rule of thumb level of 1.0 E-8 cm^2 for soil vapor extraction to be feasible. Based on these results, soil vapor extraction feasibility testing will not be performed nor will soil vapor extraction be a recommended option for soil remediation.

B. Results

1. Biological Testing

The level of heterotrophic microbial populations ranged from 4.4 E 2 to 9.3 E 4 colony forming units per gram dry soil weight (CFU/g_{DSW}) in the soil samples and 2.1 E 4 to 2.0 E 6 colony forming units per milliliter (CFU/ml) in groundwater samples. The percentage of organisms specifically capable of using gasoline as a carbon source, referred to as gasoline degrader organisms, ranged from approximately 7 to 41 percent in soil samples. The percentage of degrader organisms in groundwater samples ranged from 5 to 25 percent (Table 4). BioRenewal Technology concluded that there were viable populations of organisms in the soil and groundwater, but the population levels were low. Also, the site was atypical in that the microbial population levels were higher in the groundwater than in the soil.

WATER SAMPLE			
MW-10	210,000	25,000	12
MW-1C	210,000	11,000	5
RW-1	2,000,000	490,000	25

908519.TBL MICROBIO

The results of the nutrient analysis on the soil and groundwater samples were indicative of limited levels of nutrients present at the site. The level of total Kjeldahl nitrogen ranged from 232 to 284 ppm in the clayey sediments and from 90 to 144 ppm in the sandy sediments. While the level of ammonium nitrogen ranged from 1.0 to 3.0 ppm in the clayey sediments and from 2.0 to 5.5 ppm in the sandy sediments. The level of phosphate ranged from 2.0 to 3.0 ppm in the clayey sediments and from 1.0 to 2.0 ppm in the sandy sediments. The level of magnesium ranged from 290 to 340 ppm in the clayey sediments and from 80 to 200 ppm in the sandy sediments. The level of calcium ranged from 3,750 to 4,100 ppm in the clayey sediments and from 3,500 to 7,000 ppm in the sandy sediments. The cation exchange capacity ranged from 22 to 23 ppm in the clayey sediments and from 19 to 36 ppm in the sandy sediments (Appendix G).

The results of the nutrient testing were analyzed by BioRenewal Technologies and it was their conclusion that the potassium, magnesium, calcium and cation exchange capacity levels of the samples were in the range considered to be adequate for microbial growth. However, the levels of nitrogen and phosphorous were considered to be "marginally adequate." Dissolved oxygen levels in site groundwater were measured on March 4 and 7, 1994. Levels ranged from 0.0 to 10.6 mg/L (Table 5).

2. Groundwater Trenching and Pumping

The results of screening level groundwater modeling were indicative of a low flow situation. The recovery well RW-1 was dewatered by a pump rate of 0.06 gallons per minute (gpm) after 24 hours. Analysis of the effects of pumping from a system of trenches, which would be excavated to a depth of twelve feet bgs, indicated that the trenches would capture the known extent of petroleum contamination (Figure 8). A recovery well near MW-1A would extract the deeper GRO contamination at the 20-30 feet bgs interval.

IV. DISCUSSION

Excavation of accessible site soils does not address soil contamination that is inferred to exist under the building immediately north of MW-2 or detected on soil samples collected under the sidewalks during the initial tank abandonment assessment and inferred to occur below 66th Street and National Avenue. It is not feasible to excavate below these streets because of the costs of street removal and restoration. There are also several utilities that pass through streets adjacent to the affected area. Similarly, the area of the

MSL: MEAN SEA LEVEL

loading dock between MW-2 and the former tank location is crossed by a gas line and a sewer.

The estimated permeability of the site soils, based on the data from RW-1, is too low for soil vapor extraction to be feasible. Therefore, the method was not pilot-tested nor can it be recommended as a viable alternative. Similarly, groundwater pump and treat from a single well or a series of wells cannot be recommended. The number of wells and connecting trenches would be too numerous.

The WDNR guidance document on bioremediation describes the following requirements for bioremediation of soil: maximum contaminant level should be less than 500 ppm GRO; moisture content should be between 25 to 85 percent of the water holding capacity of the soil; permeability should be greater than 1 E-3, but permeabilities in the range of 1 E-5 to 1 E-3 cm/sec are acceptable if other conditions are appropriate; pH should be in the range of 5 to 9; dissolved oxygen (DO) in soil moisture should be greater than 0.2 ppm and is considered rate limiting at less than one ppm; the redox potential of the soil should be greater than 100 mV (oxidizing conditions); the ratio of total carbon to nitrogen should be less than 35 and preferably less than 25; and the ratio of total carbon to phosphorous should be less than 120.

The site meets several of the requirements. The levels of residual petroleum detected in various samples collected on site were 24 to 242 ppm total petroleum hydrocarbons (TPH) from five feet into the tank excavation walls, 550 ppm TPH in the borehole for MW-2, 470 ppm TPH in SB-4, and 92 ppm GRO in SB-10. Only one sample exceeded the 500 ppm limit and the exceedence was only 10 percent. The level of soil moisture in all six soil samples was within the specified range.

The site does not meet several of these requirements. The hydraulic conductivity measured in the recovery well had a geometric mean of 8 E-6 cm/sec, which falls just outside the acceptable range. However, analyses of the grain size distribution of the three sandy soils resulted in characterizations as sandy loams, which would be expected to have hydraulic conductivities significantly higher than 8 E-6 cm/sec. The residual soil contamination at the site is expected to occur within the sandy fill material along the building and utility trenches under the loading dock. The level of DO in groundwater from areas of soil contamination as measured at MW-2 and MW-1C were less than the rate limiting level and minimum level. Groundwater at MW-2 had 0.1 ppm DO, which is less

than the 0.2 ppm limit. A groundwater sample from RW-2, which is three feet west of MW-2, had the highest bacterial enumeration, which may explain the lack of DO. Groundwater at MW-1C had 0.0 ppm DO, which should prevent the growth of aerobic organisms. MW-1C had one-tenth the level of CFUs that RW-1 had one-fortieth the CFUs of degraders at RW-1.

The area of highest contamination had adequate biological activity for passive remediation of soil contamination to be feasible. When the groundwater recovery trench system is implemented, groundwater from outside the impacted area will be drawn in to the soil contamination plume. This water should have higher levels of oxygen and nutrients than the groundwater within the plume. The result should be an increase in the biological activity with an increased degradation rate. The effectiveness of the biological degradation can be assessed after one year to determine if oxygen and nutrient additions are necessary for soil clean-up to proceed at a reasonable rate.

The contaminated site groundwater can be captured using a system of trenches for the shallow contamination and a recovery well adjacent to the MW-1 well nest to recover the deep contamination. Recovery trenches will have a larger seepage area in comparison to wells. The trenches will be constructed so that only one sump will be needed to drain the trench system, thus reducing the equipment cost in comparison to multiple wells.

V. RECOMMENDATIONS

Based on geological and analytical data obtained from the feasibility testing, GAS recommends implementation of the Remedial Action Plan of groundwater extraction and remediation utilizing trenches. Analysis of the feasibility test data indicated the trenches would capture the known extent of petroleum contaminated water. The water within the trenches will then be extracted via a recovery sump and discharged into the sewer or contained and treated. As contaminated water flows into the trenches and pumped out, fresh water will flow into the area, replacing the contaminated water. The fresh water entering the area should enhance the soils with higher levels of nutrients and dissolved oxygen, which would increase the microbial population and the rate of bioremediation of the soils.

Passive soil bioremediation and groundwater recovery will require monitoring as they proceed. As monitoring data is collected, necessary modifications will be taken, such as

addition of nutrients or dissolved oxygen. Similarly, the groundwater recovery system will be modified as required. The recovery sump pumping system could be shut down and recovery trench could be used to infiltrate nutrients.

Upon approval of the remedial action plan, specifications for the groundwater recovery system will be developed. The specifications will be incorporated within a bid document that will be used to obtain competitive bids from remedial contractors.

RE: Results of volatile organic compound contamination investigation of soils at the Pressed Steel Tank Company

Dear Jim:

The purpose of this letter is to report and document results of the volatile organic compound (VOC) investigation of soils, recommended by the Wisconsin Department of Natural Resources (WDNR) for the Pressed Steel Tank site located at 1445 South 66th Street, West Allis, Wisconsin.

On June 22, 1994, Graef, Anhalt, Schloemer & Associates Inc. (GAS) and Wisconsin Soil Testing (the contracted drillers) completed three soil borings (SB-25, SB-26 and SB-27) to a depth of 35 feet below ground surface (bgs) (Figure 1). The borings were advanced and continuously sampled in two-foot increments using hollow-stem auger and split-spoon sampling methods as described in American Society for Testing and Materials (ASTM) method D1586. To prevent potential cross-contamination, all sampling tools and downhole equipment were steam cleaned prior to drilling each boring. The split-spoon soil sampler and all sampling tools were washed in an aqueous solution of trisodium phosphate and double rinsed with clean tap water between sampling intervals.

Split soil samples were collected in pairs, one for field screening and one for possible submittal to an analytical laboratory for analysis. Field screening was performed in accordance with specifications outlined in the WDNR LUST Field Screening Procedures (PUBL-SW-176), and all analytical soil samples were collected in accordance with WDNR guidelines (PUBL-SW-175-92). Three soil samples were selected from each boring and submitted to a WDNR certified laboratory for analysis of VOC's, EPA method 8021. The samples for analysis were selected as follows: one from the interval with the highest field screening reading (which occurred at or near the water table); one from a lower depth where a second peak was detected; and one at or near the bottom of the boring, depending on field screening readings.

Examination of analytical results indicated low level detections of VOCs in all three borings. However, only one VOC that was of concern to groundwater from previous water sampling events,

trichloroethene, was detected in SB-26, at 200 parts per billion (ppb) from the 7-9 feet depth, and 1,600 ppb at the 17-19 feet depth. Analytical reports and Laboratory Results Table are contained in Appendix E and are shown on the table in Appendix D.

The following documents have been enclosed for your review:

- Site Map
- Soil Boring Logs
- Soil Boring Abandonment Forms
- Table of Field Screening Results
- Table of Soil Sample Laboratory Results
- Analytical Results Reports

Based on results of the VOC investigation, GAS feels the low levels of VOCs detected in the soils do not warrant excavation of said soils at this point. However, GAS does recommend proceeding with the proposed recovery trench remedial alternative discussed in the letter to Chip Krohn of the WDNR dated January 19, 1994 and described in the Remedial Feasibility Study dated September, 1994.

Upon your approval, a copy of this transmittal, along with the RI/FS Report, will be forwarded to Chip Krohn at the WDNR.

If you have any questions concerning the VOC investigation, the results or recommendations please call us at (414) 256-4060.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

Subject: Pressed Steel Tank Meeting

Site visit August 23, 1994 - Geoffrey Parrish Project Mgr., PST Management

See attached map for locations of additional proposed borings and delineation of contaminants. GAS plans to submit a proposal for groundwater recovery (trench) and passive biodegradation of contaminants. GAS feels there is very little room to conduct massive soil removal given the location of the buildings and National Ave. The trench will be proposed to address groundwater contamination and over time the effectiveness of natural degradation will be determined. If natural biodegradation is found not to be effective at the site GAS proposes to assess methods to add an "active" element to the soil remediation.

IN REPLY REFER TO: 92-1006

Mr. George Finch
Pressed Steel Tank Company, Inc.
1455 South 66th Street
P.O. Box 10
Milwaukee, WI 53201

RECEIVED
NOV - 3 2000
By

Dear Mr. Finch:

The Division for Environmental Quality is conditionally approving plans and specifications for a wastewater pretreatment system to serve Pressed Steel Tank Company, Inc., at Milwaukee, Wisconsin. The pretreatment system will discharge wastewater to the MMSD sanitary sewerage system. The plans and specifications submitted by John A. Cimermancic were received for approval on July 3, 1992.

The pretreatment plans were prepared by Triad Engineering Incorporated, Milwaukee, Wisconsin. A copy of the design report is attached.

The proposed pretreatment modification to the existing process will consist of the following steps:

1. Manual acidification of the spent dilute chromic acid (from the existing sealer tank and the new rinse tank) to a pH of 2.2 and 2.3.

2. Manual addition of sodium bisulfite to reach an oxidation reduction potential of between 22-230 millivolts.

3. Mixing of the new hexaualent chrome batch tank contents for 15-20 minutes.

4. Operator will utilize a portable test kit to check mg/l of hexaualent chromium. If below 4 mg/l, the contents of the batch tank will be transferred to the existing pretreatment process for precipitation, clarification and sludge handling.

The plans and specifications and other reports on file with the Department were used by the Department as the basis for conditional approval.

The plans and specifications are hereby approved in accordance with sec. 144.04, Wis. Stats., as attested by affixing on plans and specifications the stamp of approval, Number 92-1006, subject to the following conditions:

Printed on Recycled Paper

1. That all existing treatment facilities be operated as effectively as possible during the course of the construction period, and the proposed system be operated efficiently when it is placed in operation.

2. That this Division be notified when construction has commenced and again when the facilities are placed in operation.

3. That solid wastes or residuals generated as a result of the wastewater pretreatment process are handled and disposed of pursuant to Chapters 144 and 147, Wis. Stats.; Chapters NR 500 to 520 and 600 to 685, Wis. Adm. Code, and other regulations which apply to the handling of the wastewater pretreatment residues. For more information on these requirements, call Frank Schultz, Southeast District, at (414) 263-8640.

4. That the facility described in the plans and specifications is designed to provide treatment adequate to meet the pretreatment standards published by U.S. EPA for the metal finishing category, 40 CFR, Part 433 and the MMSD sewer use ordinance.

5. That the improvement(s) be installed in accordance with the plans and specifications, and the above conditions, or subsequent essential and approved modifications.

The Department has the authority under subsec. 144.025(2)(c), Wis. Stats., to adopt rules for the construction, installation, use and operation of practicable and available systems, methods and means for preventing and abating pollution of the waters of the state. Chapters NR 108 and 100, Wis. Adm. Code, have been adopted by the Department pursuant to this statutory authority. The Department has the authority to approve, conditionally approve or reject plans under sec. 144.04, Wis. Stats.

This approval shall not be construed as a Department certification of the ability of the proposed system to comply with applicable pretreatment standards. Where necessary, plans and specifications should be submitted to the Department of Industry, Labor and Human Relations, the MMSD or other state or local agencies to ensure conformance with the applicable codes or regulations of such agencies.

The Division reserves the right to order changes or additions should conditions arise making this necessary.

Tangible personal property which becomes part of a waste treatment or pollution abatement plant or equipment, may be exempt from property and sales tax under sec. 70.11(21) and sec. 77.54(26), Wis, Stats. A prerequisite to exemption under this subsection is the filing of a statement on forms prescribed by the Department of Revenue. The forms and instructions may be obtained from the Department of Revenue, Bureau of Property Tax, P.O. Box 3933, Madison, Wisconsin 53708.

If installation of these improvements has not been commenced within two years from this date, this approval shall become void. After two years, therefore, new application must be made for approval of these or other plans and specifications before any construction work is undertaken.

If you believe that you have a right to challenge this decision, you should know that Wisconsin Statutes and administrative rules establish time periods within which requests to review Department decisions must be filed.

For judicial review of a decision pursuant to secs. 227.52 and 227.53, Wis. Stats., you have 30 days after the decision is mailed, or otherwise served by the Department, to file your petition with the appropriate circuit court and serve the petition on the Department. Such a petition for judicial review shall name the Department of Natural Resources as the respondent.

To request a contested case hearing pursuant to sec. 227.42, Wis. Stats., you have 30 days after the decision is mailed, or otherwise served by the Department, to serve a petition for hearing on the Secretary of the Department of Natural Resources. The filing of a request for a contested case hearing is not a prerequisite for judicial review and does not extend the 30-day period for filing a petition for judicial review.

This notice is provided pursuant to sec. 227.48(2), Wis. Stats.

I. INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) is pleased to present this Work Plan for a Remedial Feasibility Study to Pressed Steel Tank, Inc. This Feasibility Study is in response to the June 3, 1992 WDNR request for alternatives to actively address soil and groundwater contamination. The purpose of this study is to determine the feasibility of groundwater remediation by pump and treat methods and soil and groundwater remediation by in situ bioremedial methods for site gasoline contamination.

GAS was retained by Pressed Steel Tank, Inc. to complete a Remedial Investigation addressing the subsurface contamination detected during removal of one 1,000-gallon underground gasoline storage tank located at 1445 South 66th Street, West Allis Wisconsin (Figure 1). Site activities completed to date have involved removal of the 1,000-gallon underground storage tank, and the completion of three sets of soil borings and monitoring wells. The first set of monitoring wells, MW-1A, MW-2A and MW-3A, was installed in April, 1990. The second set of wells was installed in May 1991. The third set of wells was installed in December 1992.

A. Background

1. Site History

Pressed Steel Tank, Inc. has manufactured steel tanks and various foundry products for approximately 100 years. The plant is located at 1445 South 66th Street, West Allis, Wisconsin.

The 1,000-gallon tank removed September 19, 1989 was used as a source of gasoline for in-plant trucks servicing the needs of the factory. The tank reportedly only contained gasoline. No records of inventory or non-operation are available. The tank was never leak tested, repaired or replaced. The age of the tank is unknown, however, it is reported to be older than 30 years.

As no single incident of a significant spill around the tank area was ever recorded, the contamination most likely is a result of leaking piping runs and/or leaks from the tank itself that accumulated over a long period of time.

B. Geology and Hydrogeology

1. Soils

Soils encountered at the site ranged in texture from clays to sands. Sands were encountered adjacent to the loading dock extending from the surface to 11 ft. below ground surface (bgs). Sands were also encountered below the parking lot near the corner of South 66th Street and National Avenue from 17 to 24 ft. bgs. It is not known if the sands at the loading dock are continuously connected to the sands below the parking lot. All other sampled locations had sandy clays, silty clays or clays.

2. Groundwater

The water table at the site occurs from 1 to 7 ft. bgs. In some places, such as at MW-2 and MW-3, the water table is located in a sandy unit. Whereas at all other investigated locations the water table is located in a clayey unit. Groundwater flow is to the south and east. The horizontal gradient of the water table ranges from approximately 1 E-2 to 7 E-2 ft/ft. The site is located in an industrial area with very few grassy, or otherwise un-sealed areas available for groundwater recharge. The recharge of the wells at the site was characterized as slow to very slow.

The net result of the above characteristics is that little water is expected to be produced by a recovery well installed in the site sediments and the flow of groundwater and transport of contaminants through the site soils is expected to be slow.

C. Extent of Contamination

1. Soils

Based on in-field VOC screening and laboratory analysis of soil samples collected during the tank removal and two soil boring events, gasoline contamination appears to be limited to the area illustrated in Figure 2. Additional compounds are present beyond the area illustrated in Figure 2, but these compounds are not found in gasoline and therefore probably were introduced into site soils by another source. Soil boring samples that had detected TPH concentrations characterized as gasoline were SB-2 (500 ppm) at 7-9 feet,

and SB-4 (470 ppm) at 3-5 feet. Residual contamination remains in the tank excavation walls and floor, based on results from soil samples collected during the tank removal assessment. Results from all other soil boring samples submitted for laboratory analysis registered no detection. Please see Appendix A for laboratory results of soil analysis.

2. Groundwater

Based on laboratory analysis of groundwater samples collected in November, 1992, contaminated groundwater exists in the area illustrated in Figure 3. Table 1 summarizes the concentrations of various compounds detected in MW-1 through MW-6. Various VOCs and gasoline related compounds were detected. However the extent of petroleum related contamination appears to have decreased since the June, 1991 sampling, when exceedances occurred at MW-3. Contaminant levels appear to be increasing at MW-2. The ethylbenzene level increased from 3700 to 7200 ppb, and the xylenes level increased from 1500 to 25,000 ppb. A water table monitoring well, MW-1C, installed adjacent to MW-1 (MW-1 was completed approximately 15 feet. below the water table) had exceedances of petroleum related compounds. Benzene (120 ppb) exceeded the Enforcement Standard and naphthalene (20 ppb), toluene (110 ppb) and xylenes (310 ppb) exceeded the Preventive Action Limits. Please see Appendix B for laboratory results of groundwater analysis.

D. Remedial Alternatives

There are several feasible remedial alternatives that address the petroleum soil and groundwater contamination. The first of these is groundwater pump and treat whereby contaminated groundwater is pumped from the ground, processed through an above ground treatment system and discharged to a sanitary or storm sewer. The drawback to groundwater pump and treat at the site is the variable conductivity soils. The lower conductivity silty and sandy clays will require a longer time and more wells to effect cleanup than coarser-grained soils. The next remedial method is soil vapor extraction. A blower is used to create a vacuum in the soils to move vapors through the soils. The volatile fraction of soil contamination partitions into the soil vapor and is extracted from the site soils by the blower. There are two drawbacks to use of this method at the site. The first is the variable conductivity soils. The lower conductivity silty and sandy clays will require a longer time and more wells to affect cleanup than coarser-grained soils. The second is

that a high water table will require lowering before vapor extraction can be effective. The final remedial method is enhanced natural bioremediation. The site conditions limiting natural bioremediation will be augmented so that natural biological processes can speed remediation of the soil and groundwater contamination.

II. SCOPE OF SERVICE

The scope of work includes four basic tasks: subsurface permeability testing, biological testing, data analysis, and report preparation. A groundwater recovery well will be installed and pumped, and data will be gathered from on-site monitoring wells to determine the hydrological properties of the site sediments. While the recovery well is being pumped, a soil vapor extraction test will be run on the pumping well. When the subsurface properties are known, the number and placement of additional groundwater or soil recovery wells can be determined. To determine the feasibility of enhancing natural biodegradation soil and groundwater samples will be collected for comparative microbiological enumerative analyses and basic nutrient analyses. The comparative microbiological enumerative analyses will determine the extent of contaminant-degrading microorganisms present on the site and establish a base line for later comparison. The nutrient analysis will determine the factors limiting biological growth in the soils and groundwater. The applicability of bioremedial technologies will then be evaluated. The test results will be submitted in a report that documents the field and laboratory activities, summarizes the pertinent results, and presents recommendations for remedial technology.

III. TASKS

A. Groundwater Testing

1. Well Installation

A groundwater recovery well (RW-1) will be installed in the area of the most permeable soils and highest contaminant concentration, adjacent to MW-2 (Figure 4). The groundwater recovery well will be installed in accordance with NR141 regulations. The well will be constructed of six inch diameter schedule 40 PVC and will extend to a depth of 25 feet. The well will be screened from one foot below grade because of the shallow depth of site

groundwater. The borehole will be sampled and the samples will be logged for soil texture, color, moisture, USCS soil classification and geologic origin. The data will be reported to the WDNR using WDNR Form 4400-122 and well construction will be reported using WDNR Form 4400-113A.

2. Well Pumping/Bail Down Testing

The recovery well will be pumped with a low flow, electrical, submersible, multistage, impeller pump. The level of the local water table will be monitored in site water table monitoring wells using down well pressure transducers and a data logger. The water level data will be input to a computer for analysis of site hydrogeological properties.

The pumped water will be discharged to an above ground holding tank pending disposal. The water in the pumping well will be sampled during the middle and at the end of the pump test to facilitate planning and permitting of the remedial treatment system.

B. Soil Vapor Testing

1. Vapor Sampling

A vacuum blower will be used to induce a vacuum in the recovery well. Samples of the soil gas being emitted to the atmosphere will be collected during each test. Carbon tubes will be used to collect the vapor samples for laboratory analysis. The carbon tubes will be connected to a sampling port on the soil vapor extraction testing equipment with tygon tubing, and air will be drawn through the tygon tubing with a peristaltic pump. The VOCs in the extracted soil gas will be adsorbed to the activated carbon, and the carbon tubes submitted for laboratory analysis.

Five samples of emitted vapors will be collected from the sampling port, in the two-inch pipe connecting the recovery well, and the vapor extraction system during the test. Successive samples of 0.5 L, 1.0 L, 2.0 L, 10.0 L, and 20.0 L will be passed through the carbon tubes at a rate of 0.5 L/min. A field blank will be collected for quality assurance/quality control (QA/QC).

The laboratory analysis will include the mass of benzene and VOCs adsorbed to the carbon. To obtain the concentration of the compounds in the emitted vapors, the mass of the compound will be divided by the sample volume. To obtain the emission rates for benzene and VOCs, the concentrations will then be multiplied by the vapor flow rate.

To determine the vapor flow rate, air velocities will be measured with an averaging Pitot tube in the pipe connecting recovery well VRW-1 and the vapor extraction system. Temperature and pressure will be measured in the pipe connecting VRW-1 and the vapor extraction system.

2. Permeability Estimation

To estimate soil permeability to air flow, soil gas vacuum measurements will be taken during the first two to ten minutes of each test, while the vacuum is changing. The vacuum will be measured with a PVC fitting, tubing, and a magnehelic pressure gauge. Transient vacuum will be measured at MW-2, MW-2, and MW-5 to estimate permeability. Vacuum readings will also be used to estimate radius of influence.

C. Biological Testing

Soil and groundwater samples will be collected for comparative enumeration assays (CEAs) and basic nutrient analysis. Dissolved oxygen will be measured in site monitoring wells. The results of the analyses will be used to determine the feasibility of enhanced bioremediation of site contamination, possibly by injection of air or oxygenated water. The results will provide base line data concerning the subsurface micro biological environment.

1. Soil Sampling

Soil samples will be collected from the different site soil types based on grain size (major grain size types such as sand, silt and clay). Samples will be collected from areas of heavy soil contamination, moderate soil contamination and uncontaminated areas, respectively (Figure 5). Soil samples will be obtained using hollow stem auger drilling and split spoon sampling techniques. Samples will be collected using the aseptic techniques recommended by Biorenewal Laboratories (Appendix C).

2. Groundwater Sampling

Groundwater samples will be collected from areas of heavy groundwater contamination, moderate groundwater contamination and uncontaminated areas (Figure 5). Groundwater samples (GW-1, GW-2, and GW-3) will be collected from existing site wells using the aseptic techniques recommended by Biorenewal Laboratories (Appendix C).

D. Data Analysis

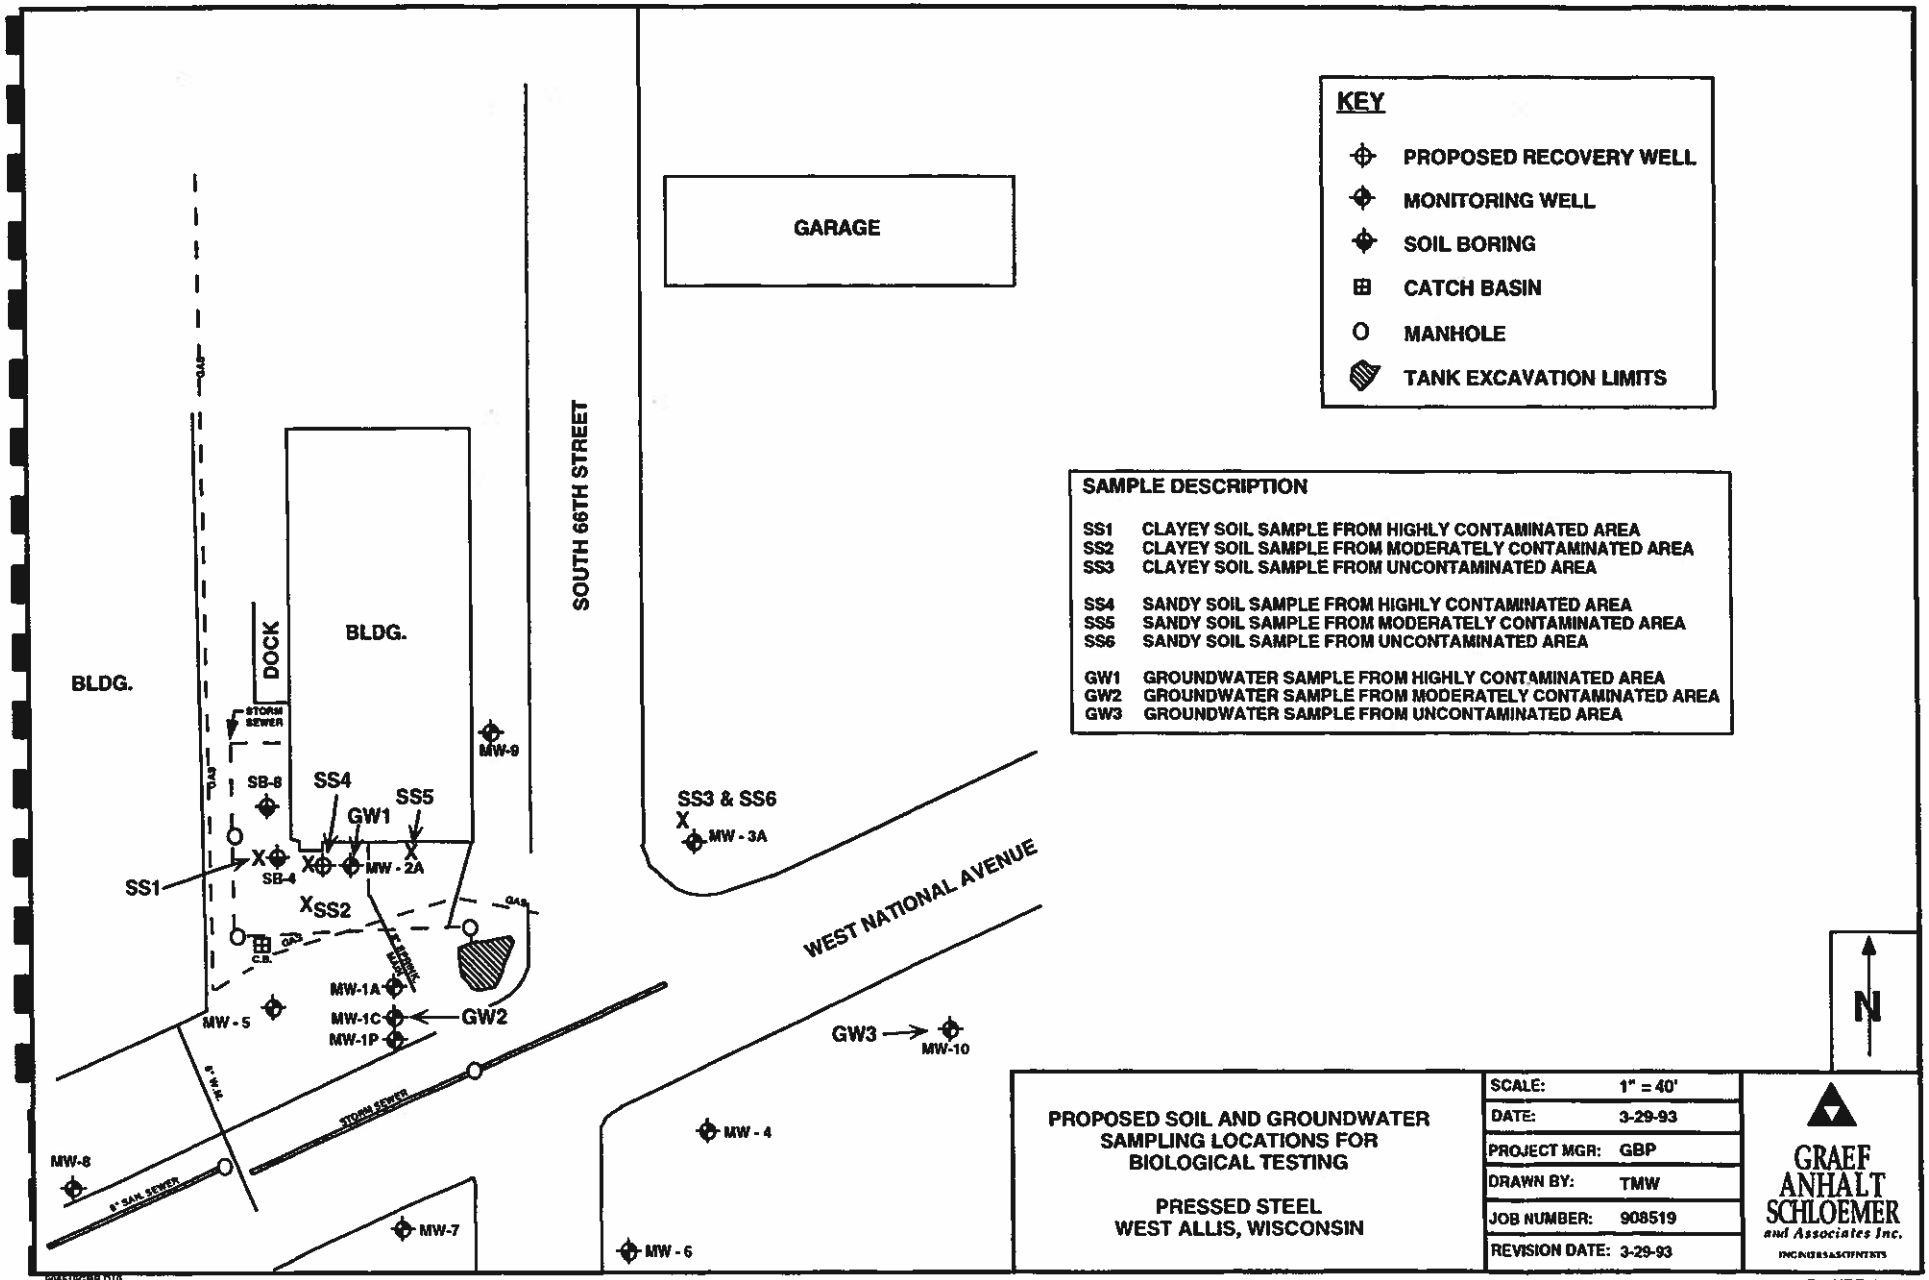
A description of the degree and extent of contamination will be presented based on the laboratory results from analysis of soil and groundwater samples. A risk assessment will be developed based on available site information. The results of the pump test and vapor extraction testing will be analyzed to determine the subsurface characteristics necessary for planning the remediation system. The results of the biological testing will provide base-line data necessary for gauging the degree of natural biological enhancement.

E. Report Preparation

A remedial investigation/feasibility study will be prepared for submittal to the WDNR. The report will document the extent of soil and groundwater contamination at the site resulting from the underground storage tank. The report will discuss feasible methods for soil and groundwater remediation, and will provide a recommendation for the most cost effective and feasible method.

IV. TIME TABLE

Upon approval of the work plan, it is estimated that field work can be completed within two weeks of scheduling a drilling contractor. Laboratory results are anticipated three to four weeks after submittal of samples. The report can be prepared in two weeks following receipt of the laboratory samples.



SAMPLE DESCRIPTION

SS1	CLAYEY SOIL SAMPLE FROM HIGHLY CONTAMINATED AREA
SS2	CLAYEY SOIL SAMPLE FROM MODERATELY CONTAMINATED AREA
SS3	CLAYEY SOIL SAMPLE FROM UNCONTAMINATED AREA
SS4	SANDY SOIL SAMPLE FROM HIGHLY CONTAMINATED AREA
SS5	SANDY SOIL SAMPLE FROM MODERATELY CONTAMINATED AREA
SS6	SANDY SOIL SAMPLE FROM UNCONTAMINATED AREA
GW1	GROUNDWATER SAMPLE FROM HIGHLY CONTAMINATED AREA

I. INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was retained by Pressed Steel Tank Inc. to complete a Remedial Investigation addressing the subsurface contamination detected during the removal of one 1,000 gallon underground storage tank located at 1445 South 66th Street, West Allis, Wisconsin (Figure 1). This report summarizes work performed from September 1989 to the present. This report attempts to follow the Wisconsin Department of Natural Resources (WDNR) Remedial Investigation guidelines as much as possible.

The scope of site activities consists of the removal of one 1000 gallon tank (performed on 9/19/89). Because contamination was discovered during the tank removal, two sets of soil borings and groundwater monitoring wells were installed to define the extent of soil and groundwater contamination. The first round of monitoring wells, MW-1A, MW-2A, and MW-3A, were drilled in April, 1990 (Figure 2). A second set of soil borings (SB-4 to SB-8) were installed in May, 1991. Three of these soil borings were converted to monitoring wells (MW-4, MW-5, and MW-6).

4. Site History

Pressed Steel has manufactured steel tanks and various foundry produced products for approximately 100 years.

The 1000 gallon tank removed September 19, 1989 was used as a source of gasoline for in-plant trucks servicing the needs of the factory. The tank reportedly only contained gasoline. No records of inventory or non-operation are available. The tank was never leak tested, repaired, or replaced. The age is unknown, however, it is reported to be older than 30 years.

As no single incident of a significant spill around the tank area was ever recorded, the contamination most likely is a result of small surface spills, leaking piping runs, and/or leaks from the tank itself which accumulated over a long period of time.

There has never been any reports of vapors, odors, or any other signs of contamination in area structures or nearby utilities.

A review of the WDNR's latest spills list, indicated that an unknown quantity of oily waste was reportedly spilled from some liquid waste pits on 7/22/86. The reported location of these pits is in the area of 67th and National (1 block west of the tank location). This location is topographically lower than the tank location so this spill would not appear to have affected the area around the tank.

5. Description of Tank and Soil Removal Activities

On September 19, 1989, a 1,000 gallon underground storage tank was removed at Pressed Steel Tank Inc. The tank excavation was located in a tightly confined area at the far southeast corner of the property near the intersection of 66th Street and National Avenue (Figure 2). The excavation was surrounded on the east and south sides by a security fence, to the west by a retaining wall and a vault for the sprinkler system, and to the north by a concrete drive. The property boundary is two feet outside the fence (Figure 2).

While excavating, a gasoline odor was noticed at a depth of 3.5 feet. The sand backfill was screened with an HNu Model PI-101 photoionization detector (PID) and was found to contain 100+ instrument units (IU) of volatile organic compounds (VOCs). After removal of the backfill, the perimeter soil material was sampled and screened with the HNu. VOC levels ranged from 60 to 208 IU (Table 1).

While excavating along the west side of the tank, a storm sewer lateral was encountered at a depth of 5.0 feet, approximately 1.5 to 2.0 feet west of the tank. While removing the tank, the storm sewer lateral was punctured in two places. The section of sewer piping running through the excavation and the contaminated sand that surrounded it were removed. Stained soil was observed around the sections of sewer lateral that extended to the north and south beyond the excavation.

On September 20, 1989, the contractor (Interstate Pump and Tank) removed the fence around the pit. The pit was excavated to the limits of the property, and to the maximum depth that the contractor's equipment would allow. Final dimensions of the pit were 20.2 feet by 9.0 feet by 8.5 feet deep. The perimeter material was sampled and screened with the HNu. VOC levels were greater than 50 IU. Results of PID field screening of soil samples collected from the excavation are listed in Table 1. Concentrations greater than 100 IU were detected during the initial excavating, then ranged from 50 to 60 IU after over-excavating. VOC field screening concentrations in the base of the excavation increased from 120 IU at 8.25 feet to 242 IU at 12.16 feet.

Approximately 45 cubic yards of contaminated soil was removed and placed on an impermeable layer of plastic on top of the asphalt parking lot across 66th Street. The edges of the plastic were turned up to prevent precipitation run-off from entering the pile. The soil was also covered by an impermeable layer of plastic to prevent infiltration of precipitation and subsequent leaching of contamination.

Laboratory analysis of a composite soil sample had concentrations of 320 ppm TPH, characterized as gasoline, 830 ppb (parts per billion) benzene, 3,500 ppb ethylbenzene, 6,000 ppb toluene, and 31,000 ppb total xylene. Laboratory results from soil samples collected during the tank removal are located in Appendix A. The contaminated soils were transported to Waste Management's Parkview Landfill on December 6 and 7, 1989.

TABLE 1

FIELD SCREENING AND LABORATORY RESULTS FROM TANK EXCAVATION SAMPLES

Pressed Steel Tank
Soil Samples Collected 9/19/89 to 9/21/89

Soil Location	Depth (feet)	Field Screen HNu (IU)
East Wall North	8.0	60
East Wall Center	8.0	150
East Wall South	8.0	175
South Wall East	8.0	120
Sewer Lateral Trench	6.5	20
South Wall West	8.0	208
West Wall South	8.5	60
West Wall Center	8.5	130
West Wall North	8.5	50
East Wall South	8.0	70
East Wall Center	8.0	50
South Wall (Under Sewer Lateral)	7.0	100
South Wall East	8.0	56
North Wall West	8.0	110
North Wall Center	7.0	10
North Wall East	8.0	140
Bottom	8.25	120

Soil Location	Vertical Depth	Lateral Depth	HNu (IU)	Laboratory Sample TPH (ppm)
North Wall	7.0	5.5	42	440
East Wall	7.0	5.33	68	100
South Wall	7.5	5.0	38	24
Bottom	12.16	--	242	28

TPH = Total Petroleum Hydrocarbons - (WDNR Allowable Limit is 10 ppm)
PPM = parts per million
IU = Instrument Units

On September 21, 1989, GAS returned to the site to conduct horizontal borings into the side walls of the excavation. The borings were conducted using a hand-powered bucket auger. A hole was augered into the center of each excavation wall (with the exception of the concrete retaining wall to the west) at a depth of 7.0 to 7.5 feet. Each hole was augered into the side wall 5.0 to 5.5 feet. A sample was taken, and split into equal portions. One portion was screened with the HNu (Table 1), the other was sent to the laboratory for a TPH analysis.

The first hole, Hand Auger 1 (HA-1) was augered in the north wall at a depth of 7.0 feet, 5.5 feet into the side wall of the pit. HNu screening detected 42 IU and lab analysis indicated 440 ppm TPH, characterized as gasoline.

Hand Auger 2 (HA-2) was bored into the center of the east wall at a depth of 7.0 feet. It reached 5.33 feet into the east side of the excavation. The HNu detected 68 IU and lab analysis indicated 100 ppm TPH, characterized as gasoline.

Hand Auger 3 (HA-3) was augered in the center of the south wall at a depth of 7.5 feet, extending 5.0 feet into the wall of the pit. The HNu detected 38 IU and lab analysis indicated 24 ppm TPH, characterized as gasoline.

A test pit was dug along the base of the excavation to determine vertical extent of contamination. The trench was dug to a depth of 12.3 feet with water being encountered at an approximate depth of 12.25 feet. A water sample was not collected because of the questionable validity of the sample. Because of the obvious presence of contamination, the water surrounding this tank would probably have anomalous chemical constituents which were not correlatable to actual groundwater constituent levels. It was also questionable as to whether this was actual groundwater or perched water in the tank backfill. A soil sample was taken just above the water interface at 12.2 feet. The HNu detected 242 IU and laboratory analysis indicated 28 ppm TPH characterized as gasoline. The excavation was backfilled with gravel and covered with topsoil.

Field screening and laboratory analyses of site soil samples indicated the presence of petroleum hydrocarbon contamination above the WDNR allowable limits. In February, 1990, GAS submitted a proposal to the WDNR to investigate site soils and possibly groundwater, if encountered, to define the extent of the contamination detected during the September, 1989 tank removal.

6. Continued Investigations

In April 1990, three soil borings (SB-1, SB-2 and SB-3) were installed (Figure 2). Soil boring logs are located in Appendix B. Soil samples were collected and field screened. Select samples were submitted for laboratory analyses (Table 2 and Appendix C). All three borings were converted to groundwater monitoring wells (MW-1A, MW-2A, and MW-3A). The wells were sampled for volatile organic compounds (VOC's) (Table 3, Appendix D).

Because VOC compounds were detected in each well, Pressed Steel Tank Inc. retained GAS to continue the investigation to define the extent of contamination. In May 1991, five additional soil borings were installed (SB-4 to SB-8) (Figure 2). Three of these borings, SB-5, SB-6 and SB-7 were converted to groundwater monitoring wells MW-4, MW-5 and MW-6. Results from this round of soil sampling are also located in Table 2 and Appendix C. Groundwater sample results are located in Table 3 and Appendix D.

In addition to sampling, monitoring wells were measured for groundwater flow direction. Three monitoring wells (MW-1, MW-2, MW-3) from an earlier Remedial Investigation located 240 feet north (Figure 2), were also measured and the data utilized in determining groundwater flow direction. Figure 3 illustrates the direction of groundwater flow with a calculated gradient in the contamination area of approximately 0.05 feet per foot.

B. Geology

The project site is located in the west-central section of the county within the Lake Border Moraine System. The site is near the crest of a hill that forms a divide between the Kinnickinnic and Menomonee Rivers. The site is in an industrial area with very few permeable areas available for groundwater recharge.

FIGURE 3

1. Soils

Soils in the Pressed Steel Tank Company area are part of the Ozaukee-Morley-Mequon Association (Figure 4). These soils develop in thin layers of loess over silty clay loam glacial till. The site occurs outside of the area of detailed soils series mapping, however, based on topography and soil association, site soils probably consist of silty clay loams developed in tills.

2. Glacial Geology

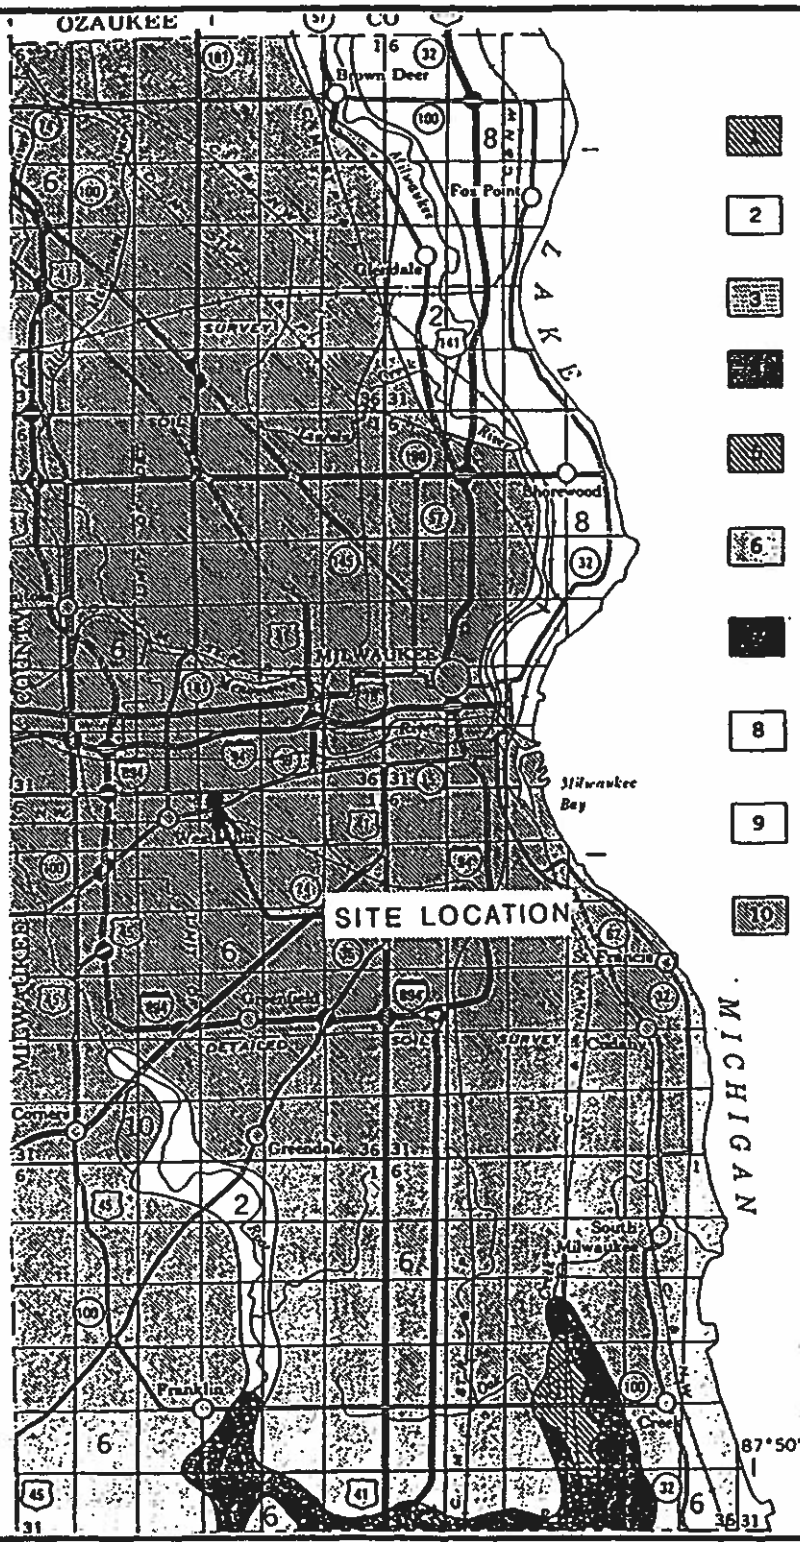
The landforms and surface deposits of Milwaukee County are a result of glaciations during the Woodfordian and Great Lakean phases of the late Wisconsinan Stage (Pleistocene Series time period). A series of recessional moraines, formed by the Lake Michigan Lobe, occur in north-trending ridges throughout the county (Figure 5). Deposits are predominantly tills, with minor areas of outwash deposits in the north, east, and south-central parts of the county. Deposits at the site are tills, based upon maps and soils in the excavation. Estimated thickness of the glacial deposits is 200 feet, based on water well contractor reports.

3. Bedrock

The bedrock units of Milwaukee County are essentially horizontally-bedded Paleozoic sedimentary rock. The northeastern one-seventh of the county is Devonian System dolomites and shales of the Milwaukee Formation (Figure 6). Bedrock in the remainder of the county is Silurian System dolomites. Estimated depth to bedrock at the site is 200 feet below ground surface, based on water well contractor reports.

C. Hydrology

Milwaukee County contains parts of the Oak Creek, Milwaukee, Menomonee, and Root River Watersheds, all of the Kinnickinnic River Watershed, and areas adjacent to Lake Michigan that drain directly into the lake. The Oak Creek, Kinnickinnic and Milwaukee Rivers drain the eastern part of the county, whereas the Root and the Menomonee Rivers drain the western part of the county.



SOIL ASSOCIATIONS

1 Houghton-Palms-Adrian association: Very poorly drained organic soils in depressions on old lakebeds and on flood plains

2 Fox-Casco association: Well-drained soils that have a subsoil of clay loam; moderately deep to shallow over sand and gravel, on outwash plains and stream terraces

3 Warsaw-Lorenzo association: Well-drained soils that have a subsoil of clay loam; moderately deep over sand and gravel, on outwash plains and river terraces

4 Boyer-Oshtemo association: Well-drained soils that have a subsoil of sandy loam and sandy clay loam; underlain by sandy material, on outwash plains

5 Rodman-Casco association: Excessively drained to well-drained soils that have a subsoil of gravelly sandy loam and clay loam; shallow over gravel and sand, on the Kettle Moraine

6 Ozaukee-Morley-Mequon association: Well-drained to somewhat poorly drained soils that have a subsoil of silty clay loam and silty clay; formed in thin loess and silty clay loam glacial till, on moraines

7 Montgomery-Martinton-Hebron-Saylesville association Poorly drained to well-drained soils that have a subsoil of clay to clay loam; formed in silty clay or silty clay loam sediments, in old lakebeds

8 Kewaunee-Manawa association: Well-drained to somewhat poorly drained soils that have a subsoil of clay and silty clay; formed in thin loess and silty clay glacial till, on moraines and in depressed areas

9 Hochheim-Theresa association: Well-drained soils that have a subsoil of clay loam and silty clay loam; formed in thin loess and loam glacial till, on ground moraines

10 Pella, moderately shallow variant-Knowles association: Poorly drained and well-drained soils that have a subsoil of silty clay loam or clay loam; moderately shallow over dolomite bedrock

FIGURE 6

Pressed Steel Inc. is located within and near the southern boundary of the Menomonee River Watershed. The boundary with the Kinnickinnic River Watershed occurs along National Avenue in the area of the investigation site. Run-off at the site is expected to be intercepted by storm sewers.

A hydrological budget for Milwaukee County from the U.S.G.S. Hydrological Atlas, based on climatological and environmental data from 1931 to 1960, may be summarized as follows. An average of 29 to 31 inches of precipitation falls on the county. Eight inches of intercepted precipitation leave the county as runoff, and 20 to 23 inches leave as evapotranspiration. Two-tenths of an inch are accounted for as pumpage and groundwater flow out of the county. On average there is no net change in storage calculated for the county. However, there are areas in Milwaukee where significant losses in storage are occurring.

D. Hydrogeology

Milwaukee County's hydrogeology is dominated by three aquifers: two bedrock aquifers in Paleozoic sedimentary rock, and a sand and gravel aquifer in unconsolidated outwash deposits.

1. Bedrock Aquifers

The deep bedrock aquifer is predominantly Cambrian and Ordovician sandstones and some dolomites, and is generally referred to as the sandstone aquifer. Throughout the county, the sandstone aquifer is confined by an aquiclude, the Ordovician Maquoketa Shale. The aquifer is used for high-yield industrial and private wells.

The shallow bedrock aquifer, the Silurian dolomite aquifer, occurs throughout the county. The aquifer, either by itself or in hydraulic connection with the overlying sand and gravel aquifer, forms the water table aquifer and is used for shallow, industrial, and private wells.

The sandstone aquifer is recharged from four sources. The first is leakage of groundwater from overlying aquifers through the intervening aquiclude, the Maquoketa Shale. Leakage occurs where the shale is thin, fractured, or interbedded with more permeable units. The second source of recharge is through uncased wells that tap both the dolomite and the sandstone aquifers. Flow of water from the dolomite to the sandstone occurs because of the greater hydraulic head in the dolomite aquifer. The third source of recharge occurs where the dolomite aquifer and the Maquoketa Shale are missing, and groundwater from sands and gravels or precipitation infiltrates into the sandstone. The fourth source of recharge is infiltration of lake or river water into the sandstone aquifer. The third and fourth sources of recharge occur west of Milwaukee County, but are the most significant sources of recharge to the aquifer.

2. Glacial Aquifer

The glacial aquifer is in sands and gravels deposited by Pleistocene ice sheets in spatially discontinuous outwash deposits throughout Milwaukee County. The aquifer is tapped for low yield private and industrial uses.

In Milwaukee County, the sand and gravel and the dolomite aquifers are recharged with waters from rivers and lakes. Depending on changing climate and seasonal weather patterns, recharge occurs where and when there is a net influx of water to an aquifer. More significantly, however, are areas where sands and gravels or dolomites are at or near the surface, and infiltration of precipitation may occur directly through higher permeability soils.

The sand and gravel and the dolomite aquifers discharge to streams, inland lakes and Lake Michigan, where and when the net effect of changing weather and climate conditions and aquifer use is an outflux of water. Other discharge areas occur where water is lost through uncased wells and leakage through the Maquoketa Shale to the sandstone aquifer. Additionally, municipal wells, industrial parks, and quarry operations can cause significant discharge areas. The only significant discharge areas of the sandstone aquifer result from high capacity wells.

A selection of water wells located in the Pressed Steel Inc. area are depicted on Figure 7. Water well contractor reports for these wells are contained in Appendix E.

FIGURE 7

III. RISK ASSESSMENT

Numerous utility lines lie within the area of contamination (Figure 2). Because the site soils consist mainly of clays, these utility lines could act as a less resistive pathway for contamination migration. The most likely utility line which could act as a conduit pathway would be the storm sewer which was located immediately adjacent to the underground storage tank. This is the utility line which was ruptured during the tank removal. Contaminated soil was located around sections of the sewer lateral which extended north and south beyond the excavation limits. Also, two large buildings lie adjacent to the area of contamination. The location of any subsurface drainage tiles lying adjacent to the two buildings is unknown but could present a pathway for contaminant migration should they be present. Basements do not exist beneath the two buildings. Construction records are not available for these buildings, however, there is the possibility of a gravel underlayment beneath the buildings which could act as a migration pathway for contamination.

A more permeable soil lens of silty sands appears to be continuous from SB-4 to MW-2A to MW-3A (Figures 2 & 8). This silty sand layer appeared in each of these borings, ranging in depth from 9 to 10 feet bgs in SB-4 and MW-2A to 16 to 22 feet in MW-3A. This sandy layer was not encountered in soil borings SB-5 and SB-6, located south of National Avenue, so it is unlikely that this layer would act as a southerly migration pathway. However, eastern or western contaminant migration through this layer is a possibility. Groundwater movement through the clay is very slow due to the "tight" nature of the soils, therefore, the contamination located in the clays would not appear to present a high migratory risk.

A. Potential Receptors of Contamination

There are a few industrial supply wells located within a one-half mile radius of the site, however, they are all cased at least 100 feet bgs and would not appear to be threatened by the contamination at Pressed Steel.

FIGURE 8

Buildings on site are of a heavy industrial nature built on 14 inches of concrete and do not contain basements. The remaining contamination located in the tight clays and thin sand seams does not appear to present a major health risk to the personnel working at Pressed Steel.

The closest residential basements are located approximately 80 feet from the tank excavation. Soils between the former source and these residences consist mainly of tight clays. Various utility lines also are located between the source and the basements which may act as a boundary for contaminant migration (Figure 3).

B. Potential Health Risks

Because the contamination lies within tight clays which are covered by 14 inches of concrete, human exposure risks are minimal. If subsurface utility work is ever performed in this area, however, there would be possible exposure to workers if contamination has migrated to the less resistant material surrounding these utilities.

The threat to area supply wells is minimal due to the low hydraulic conductivity of the site soils and because the area supply wells are cased over 100 feet bgs.

IV. RESULTS

Tables 1 to 3 summarize the field screening and laboratory results from all soil and groundwater sampling events.

Based on laboratory analyses, soil contamination appears to be limited to the area designated on Figure 9. Appendix A contains the laboratory reports from soil samples collected during the tank removal, and Appendix C contains laboratory reports from soil samples collected during the soil boring events.

Groundwater, located at approximately 4 feet bgs, appears to be contaminated in the area illustrated on Figure 10. This conclusion is based on laboratory results from two groundwater sampling events conducted in May, 1990 and May, 1991 (Appendix D).

FIGURE 10

A. Sampling Methods Used

The following descriptions represent the soil sampling procedures which were followed for both boring events:

Soil borings were drilled with a Central Mining Equipment Model 45 truck mounted drill rig using 4.25-inch inner diameter hollow stem augers. For each sample interval, a split-spoon was driven through the lead auger, the spoon removed, the auger closed, and the hole bored to the base of the sampled interval. After the sample was removed, the spoon was washed with trisodium phosphate (TSP), double rinsed with potable water, and assembled for the next sample interval.

Each split spoon sample was separated into two equally representative portions. One portion was packed tightly into 4-ounce glass jars with teflon-lined lids and packed on ice to preserve the sample for possible laboratory analysis. The second portion was placed into 8-ounce glass jars, covered with aluminum foil and capped. These samples were allowed to warm up to approximately 70°F for at least 20 minutes before they were field screened.

Field screening of the soil samples was performed by removing the cap from the 8-ounce jar and inserting the probe of a photoionization detector (PID) through the aluminum foil seal into the headspace of the jar. Samples were screened in a location which was isolated from as many potential VOC sources as possible. Any background levels of VOC's were noted and subtracted from the PID readings.

Two types of PID's were used for field screening. During the April 17, 1990 boring event, an HNu Model PI-101 PID with a 10.6 electron volt lamp was used. On May 3, 1991 boring samples were field screened using a Thermo Environmental Instruments Inc., Model 580B Organic Vapor Meter (OVM) equipped with a 10.6 electron volt lamp. PID's were calibrated to 100 ppm isobutylene at the start of each day. The PID's were periodically checked during the day for calibration.

B. Abandonment Methods

All soil borings were abandoned by completely filling the hole with bentonite chips, then sealed with asphalt patch or concrete, flush with grade. Abandonment forms are located in Appendix F. Soil boring cuttings were placed into 55-gallon drums and stored on site.

C. Monitoring Well Installation and Sampling

All soil borings which were not abandoned were converted to groundwater monitoring wells. Wells were constructed in accordance with Chapter NR 141 of the Wisconsin Administrative Code.

Groundwater monitoring wells MW-1A, MW-2A, and MW-3A were installed into soil borings SB-1, SB-2, and SB-3 on April 17, 1990. Monitoring wells MW-4, MW-5, and MW-6 were installed into borings SB-5, SB-6 and SB-7, respectively, on May 17, 1991. All monitoring wells were constructed of 2-inch diameter Schedule 40 PVC pipe. All well screens were 10 feet in length with 0.010 inch slots, except for MW-4 which has a 15 foot screen, and MW-5 which has a 5-foot screen.. The 15-foot length of screen was chosen in MW-4 because of the uncertainty of the water table depth during the installation. The hydraulic conductivity of the tight clay at this location made it difficult to determine exact depth to groundwater so a 15-foot screen was used to insure that the water table would be intersected. A 5-foot screen was used in MW-5 because the soil boring was advanced to 8.8 feet bgs and discontinued because of drilling problems (an obstruction) and groundwater had been encountered in nearby wells at approximately 3 feet bgs. Well screens were packed with silica sand to two feet above the screens. Granular bentonite was used to seal the wells to one foot bgs. Concrete was used as a surface seal. Because the wells were located in areas of vehicle traffic, they were installed below grade and capped with flush-mount protective covers. Appendix G contains well construction forms.

D. Well Development

All wells were developed to remove any fine-grained sediments which may have entered the well screen during installation. The wells were developed using teflon or PVC bailers. See Appendix G for well development forms. All wells were able to be purged dry. All water removed during development and sampling was placed in 55-gallon drums and stored on site.

Water level measurements were obtained using an electric water level indicator. Approximately five days after well development, water samples were collected from the wells. Each well had dedicated rope to lower and raise the corresponding bailer, which was also used to collect water samples. Groundwater samples were placed in a 40-milliliter volatile organic analysis (VOA) vial and stored on ice, as indicated on the water sampling logs in Appendix H. All samples were sent with a chain-of-custody document to a State of Wisconsin certified environmental laboratory, and analyzed for VOC's. The results of the groundwater analyses are illustrated in Table 3.

Measurements of pH, specific conductivity, and temperature were also recorded from each groundwater sample as well as color, odor, and appearance (Appendix H). Laboratory analysis of a field blank was included as a quality assurance/quality control measure. A field blank was collected during well sampling. Distilled water poured through the decontaminated PVC bailer comprised the field blank.

E. Survey Methods

A total station and data collector was used to obtain topographic information of the monitoring wells and the other borings. Three elevations were taken at the north side of the monitoring well: top of the protective pipe, the top of the PVC, and the ground surface elevation. Water table elevations were also taken from the north side of the PVC. The survey data and groundwater elevations from the four monitoring wells were used in determining groundwater flow direction and horizontal gradient. Refer to Figure 3 for the groundwater elevation contour map. In addition to well elevations, lateral distances were also surveyed.

F. Slug Test Data

On June 14, 1991, a bail-down test was performed in wells MW-1 and MW-2. This test was performed in order to obtain hydraulic conductivity values of the soils surrounding these wells.

The bail down test procedure was as follows: the wells were bailed down until dry or until a minimal amount of water was remaining in the well casing. At this point, a pressure transducer was inserted into the well and the water level measured. The pressure transducer monitors the water level by the difference in pressure caused by the difference in the height of the water column. The transducer was connected to a SE 200B data logger which printed out time versus height of water column.

The received data (head ratio and time) were then plotted on semilogarithmic graph paper to produce a graph (Appendix I). These plots were accomplished using the Bouwer, Rice slug test method for unconfined aquifers with partially penetrating wells. Geraghty & Miller Inc. AQTESOLV computer program was the software used for plotting these graphs.

The resulting hydraulic conductivity values (K) were 1.77×10^{-6} ft/min for MW-1 and 1.02×10^{-6} ft/min for MW-2. These results correlate with site soils and field observations in that groundwater flow is very slow at this site and thus migration potential in these soils is minimal.

V. DISCUSSION

A. Extent of Soil Contamination

Based on field screening and laboratory analyses results of soil samples collected during the tank assessment and two soil boring events, gasoline contamination appears to be limited to the area illustrated on Figure 9. Additional compounds are present beyond the area illustrated by Figure 9, but these compounds are not found in gasoline and therefore probably were introduced into site soils from another source. Soil

boring samples that detected TPH concentrations characterized as gasoline were SB-2 (550 ppm) at 7-9 feet, and SB-4 (470 ppm) at 3-5 feet. Soil samples submitted from SB-4 at 21-23 feet and 13-15 feet in SB-4, registered no detect. Residual contamination remains in the excavation walls and floor based on results from soil samples collected during the tank removal assessment. Results from all other soil boring samples submitted to the laboratory registered no detect.

B. Extent of Groundwater Contamination

Based on laboratory analysis results from groundwater sampling, contaminated groundwater exists in the area illustrated in Figure 10. Table 3 summarizes the concentrations of various compounds detected in MW-1 through MW-6. Various VOCs were detected at wells MW-1A and MW-5, yet these VOCs are probably not the result of use of the petroleum tank system, whereas at wells MW-2A, MW-3A, and MW-4, petroleum volatile organic compounds were detected. The highest levels occurred at MW-2A where benzene, ethylbenzene, toluene and xylenes were detected at levels above the WDNR Enforcement Standard (ES) and Preventive Action Limit (PAL). In MW-3A only the level of xylenes were above the PAL; in MW-4 the xylene levels were less than in the field blank sample (lower by a factor of 10). Accordingly, the contamination detected in MW-4 may have been the result of insufficient cleaning of the sampling bailer.

C. Difficulties Encountered During the Investigations

The development and sampling of MW-5 was difficult because of the extremely slow recharge rate of this well. This well contained approximately one foot of groundwater three weeks after its installation. Distilled water was added to enable purging and surging of the well. After two surge and purge events, the well was bailed dry. A grab sample was collected and submitted for a VOC analysis once enough water accumulated in the well to collect. See Appendix G for the well development form from MW-5 which describes the procedure in detail. Realistic water elevations were recorded after allowing the well to recharge for 5 weeks after sampling.

VI. CONCLUSIONS

Gasoline contamination of site soils and groundwater occurred as a result of the operation of an underground gasoline storage tank. The presence of volatile compounds which are not found in gasoline indicates another source has possibly introduced organic contaminants into the soil and groundwater. The surface beyond the area excavated during the tank removal, where soil contamination was found, is covered with pavement. In addition, sub-surface sediments away from the building are clays, and thus little infiltration of precipitation should occur. Water moves very slowly through clays and accordingly, contaminated water should not migrate very far.

The water table probably has a local mounding in the area of the tank excavation because of the higher hydraulic conductivity of the backfill. Similarly, a mounding would have occurred when the tank was in place. A sand layer was encountered at approximately the same elevation in boreholes for MW-2A and MW-3A and borehole SB-4. Transport of contaminants to the area of MW-3A would have been accelerated by the sand layer. Contaminants from the tank area could have been transported toward the areas of MW-2A and MW-3A. Petroleum groundwater contamination does not extend to the areas of MW-1, MW-4, MW-5, or MW-6; wells where the sand layer was not encountered. Therefore, it appears that contamination migration has followed the path of least resistance and traveled through more permeable material. Groundwater flow direction (Figure 3) generally flows south, however, the migratory path of contaminants flows northeast and northwest. The topography of the area (the tank was at a topographic high) also supports the possibility of contaminant transport in the upgradient direction.

VII. RECOMMENDATIONS

Because of the limited extent of soil contamination, the low hydraulic conductivity of the soils, and pavement cover over the soils, it is recommended that the contaminated soils be allowed to passively remediate through natural processes.

FACILITY DESCRIPTION ABSTRACT

Project Contact:	Mr. James Julien, Manager of Facilities, Maintenance, and Environment 1445 South 66th Street West Allis, Wisconsin 53214
Site Address:	1445 South 66th Street West Allis, Wisconsin 53214
Site Description:	NW1/4, NE1/4, Section 3, T6N, R21E, Milwaukee County
Type of Operation:	Company Fuel
Tank Excavation:	One 1,000 gallon gasoline tank

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was contracted by Pressed Steel Tank Inc. to perform an investigation of possible soil and groundwater contamination resulting from the operation of an underground petroleum storage tank at 1445 South 66th Street, West Allis, Wisconsin (Figure 1).

BACKGROUND

On September 19, 1989, a 1,000-gallon underground regular gasoline storage tank was removed at Pressed Steel Tank Company Inc. The tank excavation was located in a tightly confined area at the far southeast corner of the property near the intersection of 66th Street and National Avenue. The excavation was surrounded on the east and south sides by a security fence, to the west by a retaining wall and a vault for the sprinkler system, and to the north by a concrete drive. The property boundary is two feet outside the fence (Figure 2).

During excavation, a gasoline odor was noticed at a depth of 3.5 feet. The sand backfill was screened with an HNu Model PI-101 photoionization detector and was found to contain 100+ ppm (parts per million) of volatile organic compounds (VOCs). After removal of the backfill, the perimeter soil material was sampled and screened with the HNu. VOC levels were 60 to 208 ppm.

While excavating along the west side of the tank, a storm sewer lateral was encountered at a depth of 5.0 feet, approximately 1.5 to 2.0 feet west of the tank. While removing the tank, the storm sewer lateral was punctured in two places. The section of sewer piping running through the excavation and the contaminated sand that surrounded it were removed. Stained soil was observed around the sections of sewer lateral that extended to the north and south beyond the excavation.

On September 20, 1989, the contractor removed the fence around the pit. The pit was excavated to the limits of the property, and the maximum depth the contractor could reach. Final dimensions of the pit were 20.2 feet by 9.0 feet by 8.5 feet deep. The perimeter material was sampled and screened with the HNu; VOC levels were greater than 50 ppm.

FIGURE 2

Approximately 45 cubic yards of contaminated soils were stockpiled in the staging area. The soils were placed on an impermeable layer of plastic on top of the asphalt parking lot across 66th Street. The edges of the plastic were turned up to prevent precipitation run-off from entering the pile. The soil was also covered by an impermeable layer of plastic to prevent infiltration of precipitation and subsequent leaching of contamination.

Laboratory analysis of a composite soil sample had concentrations of 320 ppm TPH, 830 ppb (parts per billion) benzene, 3,500 ppb ethylbenzene, 6,000 ppb toluene, and 31,000 ppb total xylene. These results are further evidence of soil contamination occurring at the site.

On September 21, 1989, holes were augered into the center of each excavation wall (except the retaining wall) to a distance of 5.0 to 5.5 feet, at a depth of 7.0 to 7.5 feet. Samples were taken, screened with the HNu and sent to the laboratory for analysis of total petroleum hydrocarbons (TPH). Also, a test pit was dug in the base of the excavation. Water, possibly groundwater, was encountered at a depth of 12.5 feet. However, no sample was collected because of the questionable validity of the samples; water ponded in the sediments surrounding a tank would probably have anomalous chemical constituents levels that are probably uncorrelatable to groundwater constituent levels. A soil sample was taken, field-screened, and sent to the laboratory for analysis of TPH. Photoionization detector field screening for VOCs measured concentrations greater than 100 ppm in the initial excavation, from 50 to 60 ppm after overexcavation, and 28 to 63 ppm at a distance of five feet into the walls. VOC concentrations in the base of the excavation increased from 120 ppm at 8.25 feet to 242 ppm at 12.16 feet (Appendix A).

Soil samples collected from a distance of five feet into the walls contained from 24 to 440 ppm gasoline (laboratory interpretation of samples) and a sample from the base of the excavation contained 28 ppm gasoline.

SCOPE OF WORK AND OBJECTIVES

During this phase of investigation, the extent of study included three soil borings and three monitoring wells (Figure 2). Soil borings were drilled to determine the degree

and extent of soil contamination. Monitoring wells were constructed to sample groundwater in order to determine whether on-site groundwater was contaminated.

METHODS OF INVESTIGATIONS AND FIELD OBSERVATIONS

Every attempt was made to locate soil borings where subsurface conditions could best be documented. However, subsurface conduits, structures, and property boundaries restricted the location of boreholes.

Soil boring and monitoring well construction began on April 17, 1990, and continued through April 18, 1990 (Appendices B and C). Three soil borings (Figure 2) were drilled with a Central Mining Equipment Model 45 truck-mounted drill rig, using 2.75 inch inner diameter hollow stem augers. Soil samples were collected continuously using split spoon samplers. For each sampling interval, a split spoon was driven through the lead auger, the spoon removed, the auger closed, and the hole bored to the base of the sampled interval. After a sample was removed, the spoon was washed with TSP, double rinsed with potable water, and assembled for the next sample interval.

Each sample was split approximately in half and placed in Ziploc plastic bags. The first half was bagged and placed in a cooler in order to preserve the sample for possible laboratory analysis. The second half, enclosed in a Ziploc plastic bag, was allowed to reach room temperature and was then field screened for volatile organic compounds (VOCs). Samples were field screened with an HNu brand Model PI-101 photoionization detector. The detector was calibrated to benzene at the start of the field day and checked with benzene at the close of the day for instrument drift.

Soil samples collected for laboratory analysis were collected where the highest VOC concentration occurred in a boring, and again at the end of a boring. The samples were placed in four-ounce glass jars and packed tight to eliminate as much head space as possible. Sample jars were sealed with Teflon-lined lids, placed in a cooler and sent to a state certified laboratory. Soil samples submitted to the laboratory were analyzed for TPH.

Monitoring wells were constructed in three boreholes (Figure 2). Monitoring well construction was as follows. A ten feet long PVC well screen with 0.010 inch slots

was connected to a half-foot end cap and a schedule 40 PVC well case. PVC sections were connected using internal threads and a rubber O-ring seal between coupled sections.

After the well case was centered in a bore hole, a filter pack of number 45-50 sand was constructed to two feet above the well screen section. The filter sand was followed by two feet of fine sand. The fine sand was followed by two feet of bentonite pellets, followed by granular bentonite to two feet below ground surface (bgs). However, in MW-2 the fine sand was not used because the top of the screen was too close to ground surface. Monitoring wells were initially finished with flush with grade covers because of site traffic. However, GAS was informed that the area around MW-1 would be filled to sidewalk grade. Accordingly the PVC well case was extended to two feet above the proposed grade and the well finished with an above grade protective cover (Appendix C).

Monitoring well MW-1 extends to a depth of 27.87 feet below ground surface (bgs) and is located 30 feet southwest of the original tank excavation. Monitoring well MW-2 extends to a depth of 16.44 feet bgs and is located 50 feet northwest of the tank excavation. Monitoring well MW-3 extends to a depth of 18.66 feet bgs and is located 80 feet northeast of the tank excavation.

Monitoring wells were developed to remove fine-grained sediment from well screens and filter packs, and to develop the hydrological connection between wells and the formation. A bailer was used to purge wells dry. Wells were allowed to recover, then purged dry again. Approximately 18.5 gallons of water was bailed from MW-1. The well produced clear, sediment-free water. Approximately 39.5 gallons of water was bailed from MW-2. The water was turbid and had a petroleum odor. Droplets of petroleum were floating on the water. Approximately 28.5 gallons of water was bailed from MW-3. The water was initially turbid and remained turbid.

Before groundwater samples were collected, wells were purged in order to remove stagnant water from well casings and filter packs. Approximately 13.5 gallons was removed from MW-1, 12.5 gallons was removed from MW-2, and 9.5 gallons was removed from MW-3. Temperature, pH, and conductivity of the water samples were measured when samples were collected.

Soil Borings

The sediments encountered in the soil borings had a complex distribution; coarse-grained sediments grade into and are interbedded with fine-grained sediments (Figure 3). Soil boring SB-1 is located at the end of a topographically depressed trench-like area that contains a railroad siding, which parallels a loading dock area. Neither A or B soil horizons were present in SB-1. The sediments in SB-1 included clays and sandy clays (Appendix B).

Soil Boring SB-2 is located adjacent to a plant building. The upper ten feet of SB-2 was sand and gravel; no soil horizons were observed. It is probable that the sands and gravel are fill implaced during construction.

Soil Boring SB-3 is located on a topographic high that is also a surface water divide. In SB-3, below a layer of asphalt and crushed stone, sediments from 1 to 3 feet bgs appeared to be native soil horizons. The sediments at the location of SB-3 are probably an unaltered natural distribution. Below the soil horizons, 9 feet of clays occur. Below the clays, 11 feet of clayey sand, sand, and gravel occur.

The sands and gravels in SB-3 probably grade into the sandy clays in SB-1. A sand stringer in SB-1 may also be connected to the sand and gravel in SB-3 (Figure 3). The upper clay unit in the three soil borings appears to be the same unit, forming a seal between the surface and coarser-grained more permeable sediments at depth.

Field Screening

Samples from soil borings were field screened for VOCs using an HNu Model PI-101 photoionization detector. VOC levels ranged from <0.1 ppm to 400 ppm (Table 1). In soil boring SB-1 VOC levels were comparatively higher in the upper 19 feet than in the lower 20 feet: an average of 16 ppm compared to an average of 1.5 ppm in the lower zone. VOC levels were highest in the upper 7 feet; the levels ranged from 25 to 30 ppm. In soil boring SB-2, VOC levels were high, an average of 106 ppm. The maximum level, 400 ppm, occurred at 7 to 9 feet bgs in a layer of black-stained sediment. The soil had a noticeable gasoline odor. In soil boring SB-3, VOC levels were low. No sample had a VOC level higher than 0.5 ppm. The average was 0.2 ppm.

Groundwater

The water table elevations were measured on four occasions (Table 2). The first two measurements were collected during well development on April 24 and 30, 1990 (Figure 4). On those occasions the apparent flow direction was east of south (S16°E and S8°E). The third measurement was collected before sampling, on May 21, 1990. The apparent flow direction was to the south (S10°E).

The first three sets of measurements were collected before well covers were vented. When well covers were opened an audible release of air occurred, and well covers were lifted by pressure from released gases. After the well covers were vented and wells allowed to stabilize for two weeks, water table elevations were measured. The apparent flow direction on June 6, 1990, was to the south (S17°E). Throughout the investigation, the wells had a consistent flow direction to the south averaging S13°E.

Although the apparent flow direction appears to preclude the possibility of groundwater flow from the area where the storage tank was located, toward MW-2 (Figure 4), the water table at the tank excavation area is probably a local high. The resulting flow would be radial as in Figure 5, and thus to both MW-2 and MW-3. Additionally, a radial flow pattern would in part help to explain the observed difference in soil and groundwater BTEX levels. Additionally, a sewer lateral was located adjacent to the storage tank (Initial Environmental Assessment). The lateral extends to the west through the loading dock and to the south across National Avenue. Sediments along the sewer were probably a conduit for movement of water and petroleum from the tank area towards the loading dock area.

During the investigation from April 24 to June 6, water table elevations in MW-1, MW-2, and MW-3, in general, had an increasing trend (Figure 6). However, the water table elevations in MW-3 decreased between the third and fourth measurements.

LABORATORY RESULTS

Soil Samples

Soil samples were collected from the intervals where field screening indicated possible contamination and at the end of a boring. Soil samples were submitted to a state

certified laboratory (Appendix F). Only one soil sample had TPH levels above the laboratory detection limit of 5 ppm (Table 1). In soil boring SB-2, soils from 7 to 9 feet bgs were stained black, smelled of petroleum, and field screened at 400 ppm VOCs. The soil sample had a TPH level of 550 ppm, characterized as gasoline. The soil sample from the end of SB-2 had no detection of TPH. No TPH was detected in either SB-1 or SB-3.

Water Samples

Groundwater samples were collected on May 21, 1990, and submitted to a state certified laboratory (Appendix G). VOC scans were run on the samples to analyze for BTEX to verify field VOC screening results, and to test for possible site safety hazards. Monitoring well MW-1 did not contain measurable levels of BTEX, however, three species of chlorinated hydrocarbons were detected (Table 3). In monitoring well MW-2, both ethylbenzene and xylenes were detected at levels above the Wisconsin Department of Natural Resources (WDNR) preventative action limit (PAL), and in the case of xylenes, the level was above the WDNR enforcement standard (ES) and the PAL. Additionally, a chlorinated hydrocarbon, 1,1-dichloroethylene was detected in MW-2 at a concentration above both the PAL and the ES. In monitoring well MW-3, ethylbenzene and xylenes were detected. However, levels were below the PAL and ES for those compounds. Additionally, 1,1-dichloroethylene was detected at a concentration level above both the PAS and the ES.

CONCLUSIONS AND RECOMMENDATIONS

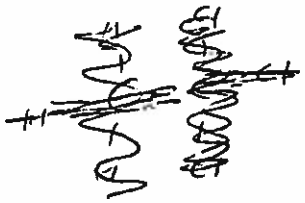
During the initial field investigation, field screening for VOCs and laboratory analysis for TPH detected significant levels of petroleum contamination, and a probable migration path, the sewer lateral, was encountered in the tank excavation. Sediments encountered in the initial tank excavation were predominantly clays. As expected, the sediments encountered in soil boring SB-1 were clays. The sediments in SB-2, however, were sands for the first eleven feet, as were the sediments in SB-3 from 12 to 23 feet bgs. Whether the sands in SB-2 are connected to SB-3 was not determined. The sewer lateral that extended through the tank excavation probably intersects the sand unit present in SB-2.

TABLE 3

Groundwater Chemical Concentrations
May 21, 1990

Groundwater Chemical Concentrations

5-21-90 Compound	MW-1 (PPB)	MW-2 (PPB)	MW-3 (PPB)	Enforcement Standard(ES) (PPB)	Preventative Action Limit(PAL) (PPB)
Benzene	ND	ND	ND	0.67	0.067
Toluene	ND	ND	ND	343	68.6
Ethylbenzene	ND	1000 >PAL	94	1360	272
Total Xylenes	ND	4400 >ES	38	620	124
Dichlorobromomethane	91	ND	ND	NA	NA
Methyl Chloride	190	ND	ND	150	15
Trichloroethene	1300	ND	ND	1.8	0.18
1,1-Dichloroethene	ND	27 >ES	160 >ES	0.24	0.024



Groundwater flow direction as indicated by field measurements would preclude migration of floating petroleum and contaminated groundwater from the tank location to MW-2, but the tank was topographically higher, and as such the water table at the tank excavation is probably higher; groundwater flow is probably to the northwest as well as to the south.

Groundwater samples from the monitoring wells MW-2 and MW-3 had petroleum contamination. However, only MW-2 had concentration levels above the WDNR PAL or ES. No petroleum contamination was detected in monitoring well MW-1, which was located ten feet west of the tank excavation. However, an in-ground cement vault was located between the tank excavation and MW-1. The vault probably was a barrier to flow of the upper few feet of groundwater flow and accordingly petroleum.

VOCs were detected in all three wells. Of the four halogenated hydrocarbons detected, three are listed in the Wisconsin Groundwater Quality Standards. All three compounds are above the respective PALs and ESs.

It is recommended that additional soil borings and monitoring wells be constructed to the south of the tank excavation to determine if soils and groundwater in that area were affected by petroleum contamination. Groundwater flow on the south side of the tank excavation is to the south, off the Pressed Steel Tank property limits. The area of recommended additional investigation is to the south of National Avenue.

Site Description:	NW1/4, NE1/4, Section 3, T6N, R21E, Milwaukee County
Type of Operation:	Company Garage
Tank Excavation:	One 1,000 gallon gasoline tank

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was contracted by Pressed Steel Tank Inc. to perform an investigation of possible soil and groundwater contamination resulting from the operation of an underground petroleum storage tank at 1452 South 66th Street, West Allis, Wisconsin (Figure 1).

BACKGROUND

On October 27, 1989, a 1,000-gallon underground regular gasoline storage tank was removed at Pressed Steel Tank Company Inc. The tank excavation was located at the northwest corner of Building B on the east side of 66th Street (Figure 2).

During excavation, soil samples were screened with an HNu Model PI-101 photoionization detector. Soils at three- or four-foot depths were found to contain 3.8 to 19.6 parts per million (ppm) of volatile organic compounds (VOCs). At a depth of seven feet, backfill material was screened with the HNu and found to contain 52 ppm VOCs. After removal of the backfill, the perimeter material was screened with the HNu and found to contain 2.4 to 72 ppm VOCs.

The pit was excavated to the limits of the property, to physical barriers, and to the maximum depth the contractor could reach (Figure 2). The final excavation dimensions were 12 feet by 9 feet by 9 feet deep. Following excavation, soil samples were screened with the HNu and sent to the laboratory for analysis of total petroleum hydrocarbons (TPH). Photoionization detector field screening for VOCs encountered levels that were generally higher in the north and east walls and base than in the west and south walls of the excavation. However, in the bottom of the east wall, the VOC concentrations were higher after overexcavation. For example, VOCs increased from 3.4 to 4.6 ppm (6.0 to 8.0 feet) in the southeast corner, from 4.0 to 48 ppm (6.0 to 7.0 feet) in the southwest corner, and from 4.0 to 58 ppm (6.0 to 8.0 feet) in the northwest corner. Concentration of VOCs remained at 52 ppm in the base of the excavation. Soil samples collected from corners and the base were analyzed for TPH. However, no TPH was detected at a 5.0 ppm detection limit (Appendix A).

SOIL BORINGS SB-1, SB-2, AND SB-3 ARE PART OF ANOTHER STUDY ON PRESSED STEEL TANK PROPERTY

FIGURE 2

SCOPE OF WORK AND OBJECTIVES

During this phase of investigation, the extent of study included three soil borings and three monitoring wells (Figure 2). Soil borings were drilled to determine the degree and extent of soil contamination. Monitoring wells were constructed to sample groundwater in order to determine whether on-site groundwater was contaminated.

METHODS OF INVESTIGATIONS AND FIELD OBSERVATIONS

Every attempt was made to locate soil borings where subsurface conditions could best be documented. However, subsurface conduits, structures, and property boundaries restricted the location of boreholes.

Soil boring and monitoring well construction began on April 17, 1990, and continued through April 19, 1990 (Appendices B and C). Three soil borings (Figure 2) were drilled with a Central Mining Equipment Model 45 truck-mounted drill rig, using 2.75 inch inner diameter hollow stem augers. Soil samples were collected continuously using split spoon samplers. For each sampling interval, a split spoon was driven through the lead auger, the spoon removed, the auger closed, and the hole bored to the base of the sampled interval. After a sample was removed, the spoon was washed with TSP, double rinsed with potable water, and assembled for the next sample interval.

Each sample was split approximately in half and placed in Ziploc plastic bags. The first half was double bagged and placed in a cooler in order to preserve the sample for possible laboratory analysis. The second half, enclosed in a Ziploc plastic bag, was allowed to reach room temperature and was then field screened for volatile organic compounds (VOCs). Samples were field screened with an HNu brand Model PI-101 photoionization detector. The detector was calibrated to benzene at the start of the field day and checked with benzene at the close of the day for instrument drift.

Soil samples collected for laboratory analysis were collected where the highest VOC concentration occurred in a boring, and again at the end of a boring. The samples were placed in four-ounce glass jars and packed tight to eliminate as much head

space as possible. Sample jars were sealed with Teflon-lined lids, placed in a cooler and sent to a state certified laboratory. Soil samples submitted to the laboratory were analyzed for TPH.

Monitoring wells were constructed in three boreholes (Figure 2). Monitoring well construction was as follows. A ten feet long PVC well screen with 0.010 inch slots was connected to a half-foot end cap and a schedule 40 PVC well case. PVC sections were connected using internal threads and a rubber O-ring seal between coupled sections.

After the well case was centered in a bore hole, a filter pack of number 45-50 sand was constructed to two feet above the well screen section. The filter sand was followed by two feet of number 50-70 fine sand. The fine sand was followed by two feet of bentonite pellets, followed by granular bentonite to two feet below ground surface (bgs).

Monitoring well MW-1 extends to a depth of 22.81 feet bgs and is located immediately north of the original tank excavation. Monitoring well MW-2 extends to a depth of 20.66 feet bgs and is located 70 feet northeast of the tank excavation. Monitoring well MW-3 extends to a depth of 20.94 feet bgs and is located 80 feet southeast of the tank excavation.

Monitoring wells were developed to remove fine-grained sediment from well screens and filter packs, and to develop the hydrological connection between wells and the formation. A bailer was used to purge wells dry. Wells were allowed to recover, then purged dry again. Bailing was continued until a total of 13 gallons was removed from MW-1, 11 gallons from MW-2, and 8.5 gallons from MW-3. All three wells produced clear sediment free water (Appendix D). Water purged from monitoring wells was stored on site in sealed drums.

Prior to water sampling, wells were purged of approximately two casing volumes of groundwater in order to remove the stagnant water from the well cases and filter packs. The wells were finished in clayey sediments and as such recharge occurred slowly. Water temperature, conductivity, and pH were measured before sampling (Appendix E).

Soil Borings

Sediments encountered in the soil borings had a uniform distribution (Figure 3). The soils were clays with varying amounts of sand, pebbles, and gravel (Appendix B). Below a layer of asphalt and crushed stone, sediments had a crumbly texture. Discrete soil peds were visible. The soils were mottled light gray and brown and were stained with iron oxide. The horizonization of the soil was interpreted as evidence that the sediments were not physically displaced and therefore probably not fill. A transition in color occurs at depth (9 to 17 feet); clays change color from brown to gray. Additionally, no sand seams or layers of coarse-grained sediments were detected in either soil borings SB-4 or SB-5. However, a three-inch thick sand seam occurred in SB-6 at 7 feet bgs.

Field Screening

Samples from soil borings were field screened for VOCs using an HNu Model PI-101 photoionization detector. VOC levels ranged from 0.2 ppm to 50 ppm (Table 1). In soil borings SB-5 and SB-6 VOC levels were below 5.0 ppm. Soil boring SB-4 had VOC levels greater than 5.0 ppm from 7 to 13 feet bgs. The highest level, 50 ppm, occurred at 7 to 9 feet bgs.

Groundwater

The water table elevations were measured on four occasions (Table 2). The first two measurements were collected during well development on April 24 and 30, 1990 (Figure 4). On those occasions the apparent flow direction was to the southeast (S33°E and S42°E). The third measurements were collected before sampling. However, the wells were not vented, and as such the wells had not equalized. When the wells were opened, an audible release of air occurred and well covers were lifted by pressure from the released gases. On May 21, 1990, the apparent flow direction was to the southwest. However, the water table elevation in MW-4 was 4.5 feet below the average elevation calculated from three other measured elevations (a change in water table elevation of similar magnitude was observed in MW-6). After the well covers were vented and the wells allowed to stabilize for two weeks, water table

FIGURE 4

elevations were measured on June 6, 1990. The apparent flow direction was to the east (N88°E).

During the investigation from April 24 to June 6, 1990, water table elevations fluctuated (Figure 5), yet there was not a consistent trend among the wells. In general, monitoring wells MW-4 and MW-6 had an increase in water table elevation, whereas MW-5 had a decrease in water table elevation.

LABORATORY RESULTS

Soil Samples

Soil samples were collected from the intervals where field screening indicated possible contamination and from the end of soil borings SB-4 and SB-5. Only one sample had TPH levels above the laboratory detection limit of 5 ppm. In soil boring SB-4, the soil sample from 7 to 9 feet bgs had a TPH of 16 ppm (the interval field screened at 50 ppm VOCs). Soil boring SB-4 was located immediately north of the tank excavation, in the area where a water main prevented overexcavation of additional sediment. The base of the tank was at approximately 8 feet bgs; the highest VOC levels occurred at approximately that depth. Soils at that location were expected to have some contamination. The end of soil boring SB-4 had no detectable TPH. No TPH was detected in samples from either SB-5 or SB-6 (Appendix F).

Groundwater

Groundwater samples were sent to a state certified laboratory and analyzed for BTEX. None of the water samples had BTEX levels above the laboratory detection limits for those compounds (Appendix G).

CONCLUSIONS

During the initial site assessment, a water main prevented overexcavation on the north wall of the excavation. Soil samples collected during the initial assessment had VOC levels that increased with overexcavation and remained approximately constant in the base of the excavation. The soil boring that was expected to have the highest levels of contamination was SB-4. Field screening and laboratory analysis confirmed that

FIGURE 5

expectation. Detectable levels of petroleum compounds were found in SB-4. The TPH concentration level, 16 ppm, was above the WDNR clean-up standard of 10 ppm. However, field screening was indicative of contamination in only a limited area (7 to 9 feet bgs and 11 to 13 feet bgs). Because a water main extends through the area of questionable soils, excavation of these soils would be difficult. Additionally, the soils are adjacent to the tank excavation, where a soil vent is in place. Soil venting of fine-grained soils is, in general, of limited affect, yet the volume of soil involved may be small enough to be affectively remediated.

No BTEX was detected in groundwater samples from monitoring wells. Although there is some uncertainty as to the direction of groundwater flow, the water samples are probably indicative of the groundwater conditions in the area of the former storage tank. Therefore, no further environmental investigation is recommended, however additional monitoring of the wells may be warranted.

Dear Mr. Julien,

RE: Phase III Contaminant Investigation
Pressed Steel Tank

The referenced G.A.S. report indicates that both petroleum and solvent contamination exists on Pressed Steel Tank property. Contaminant levels exceed the State Groundwater Enforcement Standards for xylenes, methyl chloride, trichloroethene, and 1,1-dichloroethene.

Pressed Steel Tank will be responsible for determining the horizontal and vertical extent of both soil and groundwater contamination for the listed parameters detected during the phase three investigation.

Please have your consultant submit a short workplan for both further assessment and proposed remedial action.

Sincerely,

Charles J. Krohn
Hydrogeologist

Appendix A	Cost Analysis

I. INTRODUCTION

Graef, Anhalt, Schloemer & Associates, Inc. (GAS) was retained by Pressed Steel Tank, Inc. to perform professional environmental services addressing the subsurface contamination detected during removal of one 1,000-gallon underground storage tank located at 1445 South 66th Street, West Allis, Wisconsin (Figure 1). The scope of site activities completed before this Remedial Action Option Report (RAOR) included removal of the 1,000-gallon underground storage tank and three sets of soil borings/monitoring wells. The first set of monitoring wells, MW-1A, MW-2A and MW-3A, were installed in April, 1990. The two other sets of wells were installed in May, 1991 (MW-4, MW-5 and MW-6) and December, 1992 (MW-7, MW-8, MW-9, MW-10, MW-1C and MW-1P).

A. Site History and Existing Conditions

Seamless Structural Company was organized into Pressed Steel Tank, Inc. by Robert Henry Hackney and has manufactured steel tanks and various foundry products for over 90 years. There were two underground storage tanks that were used for storage and dispensing of petroleum product on the site.

A 1,000-gallon underground storage tank was located at the northwest corner of South 66th Street and West National Avenue. The age of the tank was unknown; however, it was reported to be older than 30 years. The 1,000-gallon tank, which was removed September 19, 1989, was used as a source of gasoline for in-plant trucks. The tank reportedly contained only gasoline. No records of inventory or periods of non-operation are available. The tank was never leak tested, repaired or replaced.

B. Regulatory Status

The site was classified by the Wisconsin Department of Natural Resources as being regulated under Wisconsin Statute 144.76(3), or the "spills law." Petroleum related hazardous materials in the soils and groundwater at the site are being managed as special waste. The site is a LUST site and the former UST is registered. The site is eligible for Petroleum Environmental Cleanup Fund Act (PECFA) participation, and has been involved in the PECFA program since 1989.

FIGURE 1

The Wisconsin Department of Natural Resources (WDNR) was contacted on February 1, 1995, regarding the ranking of the site into either high, medium or low priority. The site had not yet been ranked, however based on WDNR familiarity with the site it would not be ranked in the high category. As such, the WDNR will not be actively participating in management of the remainder of the project.

In accordance with the requirements of NR 720.09(1) wherein the procedures for applying generic soil Residual Contaminant Levels (RCLs) are described, the pertinent site characteristics can be described as follows: (i) contamination in the site soils is gasoline range organics (GRO); (ii) the horizontal and vertical degree and extent of contamination have been defined and are summarized below; (iii) the depth to carbonate bedrock is approximately 140 feet below ground surface (bgs); (iv) the thickness of the contaminated soils is approximately ten feet; and (v) none of the contaminants are known to facilitate transport or to have cosolvent effects. The RCLs for specific compounds as specified in NR 720.09(3)(a) are 5.5 parts per billion (ppb) for benzene, 2,900 ppb for ethylbenzene, 1,500 ppb for toluene, and 4,100 ppb for total xylenes. The geometric mean of the hydraulic conductivity measurements at the site is 1.1×10^{-5} cm/s. As specified in NR 720.09(4) for sites with a hydraulic conductivity of greater than 1×10^{-6} cm/s, the cleanup objective would then be 100 parts per million (ppm) for GRO contamination.

C. Nature and Extent of Contamination

The extent of petroleum related soil contamination was defined at the site by several rounds of soil boring investigations. The extent was defined to the west by the borehole for MW-5, which was clean. To the northwest the extent was defined between SB-4 that was contaminated at 470 ppm total petroleum hydrocarbons (TPH) and SB-8, which was clean. To the north the extent was defined between SB-2 that was contaminated at 550 ppm TPH and SB-9, which was clean. In the area of the tank excavation, SB-10 was contaminated at 92 ppm GRO, 400 ppb benzene, 4,000 ppb ethylbenzene, 2,700 ppb toluene, and 15,000 xylenes. No contamination was encountered west of SB-10 in the borehole for MW-8 or to the south in the borehole for MW-7. The sample collected from five feet into the eastern wall of the tank excavation (underneath the sidewalk adjacent to South 66th Street) had 100 ppm TPH (Figure 2).

Groundwater samples from three monitoring wells, MW-1, MW-1C and MW-2, indicated detects of petroleum related contamination exceeding WDNR regulatory limits. The extent of

FIGURE 2

petroleum related groundwater contamination is defined by clean wells to the north at MW-9, to the northwest by MW-5, to the west by MW-8, to the south by MW-7, to the southeast by MW-4 and MW-6 and to the east by MW-3 and MW-10. The vertical extent is defined by the deep piezometer MW-1P. Based on laboratory results, the extent of petroleum related groundwater contamination is illustrated in Figure 3.

D. Geologic and Hydrogeologic Characteristics

The sediments encountered during remedial investigation at the site ranged in texture from clays to sands. Sands were encountered adjacent to the loading dock extending from the surface to 11 feet below ground surface (bgs). Sands were also encountered below the parking lot at the northeast corner of South 66th Street and West National Avenue from 17 to 24 feet bgs. It is not known if the sands at the loading dock are continuously connected to the sands below the parking lot. All other sampled locations had sandy clays, silty clays or clays. Sandy soils are typically more amenable to remediation by common technologies such as soil vapor extraction and groundwater pump and treat. It is also anticipated that the higher permeability soils would be remediated more quickly than the lower permeability clayey soils.

The site is located in an industrial area and as such the on-site and adjacent paved and developed areas limit recharge to the shallow groundwater. Groundwater was encountered on the site at one to seven feet bgs. At two monitoring wells, MW-2A and MW-3A, the water table is located within sand; whereas, at all other investigated locations, the water table is located in clay. Groundwater flow is to the south and east. The horizontal gradient of the water table ranges from approximately 0.01 to 0.07 ft/ft. The vertical gradient was measured at the MW-1 well nest. The gradient between MW-1C and MW-1A is 0.039 ft/ft downward and is 0.77 ft/ft downward between MW-1C and MW-1P.

II. REMEDIAL ACTION OPTIONS

In accordance with the requirement of NR 722.07(2), which requires a preliminary screening of remedial options, several methods of remediating the site were considered. Neither air sparging or soil vapor extraction will be considered as a possible option because of the low site hydraulic conductivity.

FIGURE 3

A. Soil Excavation and Groundwater Recovery from Sumps

A possible remedial alternative is excavation of the petroleum contaminated soils below the loading dock. Soils would be excavated to the 100 ppm GRO limit or to the extent practicable, given the limits imposed by the presence of the building to the north, South 66th Street to the east , National Avenue to the south and the various utility lines that transect the impacted area. The base of the excavation would be graded to drain into a sump pit. A large diameter screened PVC pipe would be installed in the pit to allow for draining of the excavation.

After contaminated soils are removed and the floor graded, the excavation would be backfilled with granular material and compacted. The granular material would allow for groundwater recovery from the adjacent contaminated soils below the building and along the utilities. The excavated soil could be either landfilled in a Subtitle D approved landfill.

Groundwater would be either pumped on a quarterly interval using level switches in the sump. The pumped groundwater would be either treated and discharged to a storm sewer or treated and discharged to a sanitary sewer.

The above remedial action would comply with the requirements of NR 722.09(2); which requires that the remedial alternative restores the environment, to the extent practical; and minimizes harmful effects to the air, lands and waters. The above treatment alternative would remove the remaining accessible contaminated soils to the applicable NR 720 standard, and thus remove the significant sources of future groundwater contamination. Excavation would continue below the water table in the low conductivity sediments, which would result in removal of contaminated groundwater exceeding the NR 140 groundwater quality standard.

The groundwater recovery system performance would be monitored quarterly to determine if the groundwater quality levels are approaching NR 140 cleanup objectives. Should the groundwater quality levels plateau above the NR 140 cleanup objectives, based on four quarters of data, the system configuration / operation would be re-evaluated.

The volume of contaminated soils is estimated at 1,110 cubic yards (cy). As this is less than the 2,000 cy limit requiring WDNR approval per NR 722.09(4)(b)2, WDNR approval would not be necessary. Landfill approval of the waste stream would be required. A WDNR

Bureau of Air Management Form 4400-120 (Application to Treat or Dispose of Petroleum Contaminated Soil) would have to be filed. A Wisconsin Pollution Discharge Elimination System (WPDES) permit from the WDNR would be required for the groundwater treatment system effluent to a storm sewer. As would permission from the Milwaukee Metropolitan Sewerage District (MMSD) to discharge to a sanitary sewer.

B. Passive Bioremediation of Soils and Groundwater Recovery from Wells

A possible remedial alternative is passive/active bioremediation of the soil contamination and groundwater pump and treat from several closely spaced wells. Progress of the soil remediation would be monitored on a yearly basis by collecting a soil sample for GRO and bioenumeration analyses. If soil contamination does not appear to be cleaning up, based on two successive sampling events, amendments of site nutrients would be evaluated for implementation. Groundwater recovery wells could alternatively switched off from a pumping mode and operated in an infiltration mode to deliver nutrients to the site to expedite bioremediation of the soils.

The above remedial action would comply with the requirements of NR 722.09 (2); which requires that the remedial alternative restores the environment, to the extent practicable; and minimizes harmful effects to the air, lands and waters. The soil contamination level would be monitored to verify that levels are approaching the applicable NR 720 standard.

The groundwater recovery system performance would be monitored quarterly to determine if the groundwater quality levels are approaching NR 140 cleanup objectives. Should the groundwater quality levels plateau above the NR 140 cleanup objectives, based on four quarters of data, the system configuration/operation would be re-evaluated.

Contaminated soils excavated during well installation and remedial system installation (connection trenches) are anticipated to total to less than the NR 722.07(3)(b)1 of 250 cy. As such, these soils could be landfilled without detailed evaluation of alternative remedial options. Landfill approval of the waste stream would be required. A WDNR Bureau of Air Management Form 4400-120 (Application to Treat or Dispose of Petroleum Contaminated Soil) would have to be filed. A WPDES permit from the WDNR would be required for the groundwater treatment system effluent to a storm sewer. As would permission from the MMSD to discharge to a sanitary sewer. As this project is a PECFA project, it will be

necessary to obtain approval for the Remedial Action Option Report from DILHR as per ILHR 47.33(1)(c).

C. Passive / Active Bioremediation of Soils and Groundwater Recovery from Trenches

The remedial option identified during the Remedial Investigation / Feasibility Study as the recommended alternative was monitoring of passive/active bioremediation of soil contamination with evaluation after one year to determine if site nutrients need to be amended to expedite soil remediation, and groundwater recovery from a series of trenches.

Progress of the soil remediation would be monitored by collecting soil samples annually. The samples would be analyzed for GRO, petroleum volatile organic compounds (PVOCs), enumeration of total heterotrophs, and enumeration of total degraders. If significant reduction of contamination is not observed, site nutrient conditions would be evaluated and amended. Nutrients could be infiltrated through the groundwater recovery trenches (after a cessation of pumping) and in site monitoring wells.

Groundwater trenches would be connected and sloped to a common sump (Figure 4). The sump would consist of a section of large diameter slotted PVC piping. A low flow, explosion proof groundwater pump would be placed in the sump to recover in-flowing groundwater. Level switches in the sump would be used to control cycling of the recovery pump. If technically and economically feasible, monitoring well MW-1A (two-inch diameter) would be retrofitted with a pump to capture deeper groundwater contamination observed in the vicinity of MW-1A. Otherwise, a standard four-inch diameter well would be constructed to replace MW-1A and be used as a recovery well.

The pumped groundwater would either be treated and discharged to a storm sewer or treated and discharged to a sanitary sewer. The groundwater recovery system would be operated continuously. The performance would be monitored quarterly to determine if the groundwater quality levels are approaching NR 140 cleanup objectives. Should the groundwater quality levels plateau above the NR 140 cleanup objectives based on four quarters of data, the system configuration/operation would be re-evaluated.

908519GRP.DWG

FIGURE 4

Contaminated soils excavated of groundwater recovery trenches and remedial system installation are anticipated to total less than the NR 722.07(3)(b)1 of 250 cy. As such, these soils could be landfilled without detailed evaluation of alternative remedial options. Landfill approval of the waste stream would be required. A WDNR Bureau of Air Management Form 4400-120 (Application to Treat or Dispose of Petroleum Contaminated Soil) would have to be filed. A WPDES permit from the WDNR would be required for the groundwater treatment system effluent and permission from the MMSD to discharge to a sanitary sewer. This being a PECFA project, it will be necessary to obtain approval for the Remedial Action Option Report from DILHR as per ILHR 47.33(1)(c).

D. Passive Bioremediation of Soils and Groundwater

Consideration of passive bioremediation as a remedial option is required at sites where the remedial investigation began after January 15, 1993 per ILHR 47.335(3)(a). The remedial investigation at this site began in 1990. Therefore, passive bioremediation is not required to be evaluated as a remedial option. Also, NR 722.07 notes that remedial options that are not suitable for a site need not be considered. The high levels of petroleum contamination in site groundwater vitiate the applicability of passive bioremediation of all site contamination. Therefor this option will not be considered further.

III. SELECTED REMEDIAL OPTION

A. General Description

The remedial action selected from those described above is passive/active bioremediation of soil contamination and groundwater recovery and treatment using recovery trenches. This action was chosen because of the comparative simplicity over the other actions. This option is the least costly of the three evaluated optoins, assuming groundwater remediation would require five years to accomplish. The trenching option would cost $366,855 after five years, the groundwater recovery well option would cost $423,612 after five years, and the soil excavation and groundwater pumping would cost $403,413 after five years (Appendix A).

B. Site Safety Plan

The contractor will be required to prepare a site safety plan for its personnel and specifically designed for the Pressed Steel site. A separate safety plan specific to the site will be prepared by GAS for its on-site personnel.

C. Contingencies

In the event water enters the excavation due to rain or other unforeseen circumstances, a contingency plan will be made by the contractor for the removal, treatment, and disposal of the water. Any water removed for treatment must be handled according to local, state, and federal regulations.

D. Remedial Action Implementation

As stated in Chapter NR 724, a remedial design report is to be prepared prior to the development of the remedial system construction plans and specifications. These two items are now being developed concurrently. Following development of the remedial system construction plans and specifications a bid package will be submitted to qualified contractors. A minimum of three quotes will then be obtained from qualified contractors. The selected contractor is expected to have the ability to complete the specified work in a timely and cost-effective manner and within WDNR regulations.

E. Monitoring Plan / Performance Measurement

In order to determine the effectiveness of the system, a soil and groundwater monitoring plan will be implemented.

1. Soil Monitoring

One soil sample will be collected annually near the loading dock as shown on Figure 4, and submitted to a WDNR-certified laboratory for analysis of GRO and PVOCs in accordance with WDNR published guidelines. A Geoprobe hollow drill rod will be hydraulically driven to the desired depth and then retracted to obtain the sample. This method is less intrusive than standard hollow / solid stem auger techniques.

2. Groundwater Monitoring

Monitoring wells MW-1A, MW-1C, MW-1P, MW-2A, MW-3A, MW-4, and MW-7 will be sampled semi-annually per published WDNR guidelines until contaminant levels in all the wells are below their respective NR 140 enforcement standards. The wells will then be

sampled semi-annually for an additional year to demonstrate compliance with NR 140 enforcement standards.

The collected groundwater samples will be submitted to a WDNR-certified laboratory for analysis of GRO and PVOCs.

3. System Performance Measurement

GAS will sample the influent and effluent streams of the system weekly for the first four weeks and then biweekly for a minimum of three months. A reduction in sampling frequency may be requested at that time. Sample parameters will be GRO and selected VOCs.

F. Report Preparation

A case closure report will be prepared that discusses the results of the remedial site activities. The report will provide a discussion summarizing remedial activities and make specific recommendations regarding the site's environmental conditions relative to site closure. The report appendices will include completed WDNR required forms, photographs of pertinent site activities, laboratory reports, and field screening logs as required under Chapter NR 726 regarding case closure.

RE: METHOD FOR SEPARATION OF NON-ELIGIBLE COSTS FROM CLAIM
CLAIM 53214-4936-45
PRESSED STEEL TANK INC, 1445 S 66TH ST, WEST ALLIS

Dear Mr. Strzelec:

Thank you for having your consultant submit your proposed method for removing non-eligible chlorinated solvent investigation and remediation expenses from your present claim and for future PECFA claims for this site. The Department has reviewed the proposed method dated April 4, 1995 and offers the following response.

Your consultant's proposal that only 2.88 percent of the costs incurred by Pressed Steel be deemed non-eligible is **not acceptable**. Section ILHR 47.30(4) of Wis. Admin. Code states:

(4) CONTAMINATIONS CONTAINING ELIGIBLE AND INELIGIBLE PRODUCTS. When a contamination is identified which contains both eligible and ineligible products under the fund, only the costs associated with the eligible products may be claimed. Eligible costs of remediation, which are only associated with the eligible product, may be claimed in their entirety, as specified in this section. **Any costs required because of the presence of an ineligible product may not be claimed *even if a remedial benefit may be derived* by the remediation of the eligible product.**

Your consultant's proposed method does not account for the removal of actual costs obviously incurred because of the presence of the non-eligible chlorinated solvents at this site.

Current Claim

The Department requires that you identify the following costs associated with the following wells for removal from the current claim for the reasons indicated.

- Piezometer MW-1P: Chlorinated VOC compounds are heavier than water. Regardless of the side benefit gained (wherein it was found that petroleum constituents did not migrate downward at MW-1P) clearly the original intent of installation and sampling of this piezometer was to investigate the extent of vertical migration of the non-eligible chlorinated VOC contaminants (see attached workplan). If vertical migration of *petroleum* was ever truly a concern, then logic would dictate that your consultant should have installed one or more additional piezometers in the area of greatest petroleum contaminant concentrations, near MW-2A. The Department contends that *at least* 50% of all consultant and commodity costs to plan, install, develop and perform initial sampling of this piezometer for the full range of VOCs be removed from the current claim. Furthermore, it is clear

Dear Mr. Julian:

RE: G.A.S. & Associates Proposal for Continued Phase I Assessment, 1452 South 66th Street, Milwaukee, Wisconsin

This letter acknowledges the receipt of the Scope of Work Plan/Assessment Proposal dated March 6, 1990, for the above referenced site, submitted on your behalf by G.A.S. & Associates. The Wisconsin Department of Natural Resources (WDNR) approves this plan as proposed but reserves the right to require additional work if results of this site investigation prove insufficient to:

1. Define the extent and character of contamination at the site; or

2. Develop an adequate remedial action plan.

Questions regarding this case should be directed to the undersigned at the above address or at (414) 562-9685.

Sincerely,

Charles J. Krohn
Hydrogeologist, Environmental Response

Dear Mr. Julian:

RE: Proposal for Phase I Continued Investigation, 1445 S. 66th Street, Milwaukee, Wisconsin

This letter is in response to a Phase I report submitted by G.A.S. Consultants containing results from assessment work performed to date and a proposed workplan for continued assessment.

The Department of Natural Resources approves the work plan outlined on page 16 of the referenced G.A.S. report as proposed.

Should the additional assessment fail to define the horizontal or vertical extent of soil and groundwater contamination or if the assessment proves insufficient to develop an adequate remedial action plan, the WDNR reserves the right to require additional assessment of the site.

Sincerely,

Charles J. Krohn
Hydrogeologist, Environmental Response

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was retained by Interstate Pump and Tank (IPT) to perform a tank abandonment assessment of one underground tank for Pressed Steel Company, Inc., located at 1452 South 66th Street, West Allis, Wisconsin (Figure 1). The first report, entitled Initial Site Assessment for Removal of One Underground Storage Tank was submitted to the Wisconsin Department of Natural Resources on December 7, 1989. Field screening and the results of laboratory testing of soil samples were presented and discussed in the initial site report. No groundwater was in the excavation. Accordingly, no samples were collected. Reproductions of this data are contained in Appendices A and B.

BACKGROUND

On October 27, 1989, a 1,000-gallon underground regular gasoline storage tank was removed at Pressed Steel Tank Company Inc. The tank excavation was located at the northwest corner of Building 2 on the east side of 66th Street (Figure 2).

During excavation, soil samples were screened with an HNu Model PI-101 photoionization detector. Soils at 3 to 4 foot depth were found to contain 3.8 to 19.6 ppm of volatile organic compounds (VOCs). At a depth of 7 feet backfill material was screened with the HNu and found to contain 52 ppm VOCs. After removal of the backfill, the perimeter material was screened with the HNu and found to contain 2.4 to 72 ppm VOCs.

The pit was excavated to the limits of the property, physical barriers, and the maximum depth the contractor could reach (Figure 2). The final dimensions were 12 feet by 9 feet by 9 feet deep. Following excavation, soil samples were screened with the HNu and sent to the laboratory for analysis of total petroleum hydrocarbons (TPH). The result of photoionization detector field screening for VOCs are depected

in Table 1. VOC concentrations were generally higher in the north and east walls and base than in the west and south walls of the excavation, except in the bottom of the east wall, the VOC concentrations were higher after overexcavation. For example, VOCs increased from 3.4 to 4.6 ppm (6.0 to 8.0 feet) in the southeast corner, from 4.0 to 48 ppm (6.0 to 7.0 feet) in the southwest corner, and from 4.0 to 58 ppm (6.0 to 8.0 feet) in the northwest corner. Concentration of VOCs remained at 52 ppm in the base of the excavation.

Soil samples collected from corners and the base were analyzed for total petroleum hydrocarbons (TPH). No TPH was detected at a 5.0 ppm detection limit.

Although the results of laboratory analysis for TPH and field screening appear contradictory, an explanation lies in the history of the site. The tank, according to Pressed Steel Personnel, was not used for a "long time". If petroleum hydrocarbons leaked or spilled and sufficient time elapsed for natural flushing of the petroleum hydrocarbons from the soils, no TPH would be detected. The VOCs could be residual concentrations from volatilization of initial petroleum hydrocarbons. Yet if sufficient time has elapsed for natural flushing of the petroleum hydrocarbons, the volatile fraction should also have been removed. A possible explanation, then, is that petroleum hydrocarbons at depth could generate soil gas, the VOCs detected in the excavation; the VOC concentrations increase in the direction of the source, that is with depth, as observed in the excavation. Alternatively, however, VOCs could result from a volume of immobile gases locked in tight soils below the former tank location; the VOCs decrease toward the surface because of increased distance from the source. In order to determine the source of the VOCs and determine if soil and or groundwater contamination exist further investigation is required.

TABLE 1
PHOTOIONIZATION DETECTOR READINGS
H.N.U. PI-101
AND LABORATORY RESULTS
10/27/89

SAMPLE LOCATION	DEPTH (ft)	HNu (PPM)	LAB SAMPLE
West Wall Center	4.0	19.6	
West Wall Center	6.0	22	
West Wall Bottom	8.0	9.6	
East Wall Bottom	8.0	68	
North Wall Center	6.0	72	
South Wall Center	6.0	11.4	
Southwest Corner	6.0	4.0	
Southeast Corner	6.0	3.4	
Northwest Corner	6.0	2.4	
North Wall Center	3.0	3.8	
After overexcavation the results are as follows:			
Bottom Middle Center	8.0	52	
Bottom Middle Center	10.0	52	<5.0
Southwest Corner	7.0	48	<5.0
Northeast Corner	7.0	50	<5.0
East Wall Bottom	8.0	56	
Southeast Corner	8.0	4.6	<5.0
Northwest Corner	8.0	58	<5.0

Approximately 30 cubic yards of soils were removed from the excavation. The soils were staged on a Pressed Steel parking lot. Photoionizaton detector field-screening of the soils measured VOC concentrations of 48 to 58 ppm. Laboratory analysis of a composite soil sample had concentrations of < 5.0 ppm TPH, < 10 ppb (parts per billion) benzene, 2,600 ppb ethylbenzene, 300 ppb toluene, and 7,600 ppb xylene. Additionally, total lead levels were sufficiently low, 3.4 ppm; the level was below the maximum concentration for EP toxicity of lead, 5.0 ppm, which would be a measure of lead that could leach from a soil. An EP toxicity measure would be lower than a total metal concentration for the same soil.

DESCRIPTION OF WORK AND OBJECTIVES

The scope of this work includes three soil borings (Figure 2), in which groundwater sampling wells will be constructed. However, soil borings will be drilled to a maximum depth of 40 feet. If no groundwater is encountered at that depth, a well will not be constructed. The objective is to further determine the extent of subsurface soil and possible groundwater contamination at the site. Following completion of the work, results will be furnished in a report format.

GEOLOGY

Physiography

The physiography of Milwaukee County can be characterized as gently rolling north trending glacial-sculptured hills that roughly parallel Lake Michigan. Three rivers, the Kinnickinnic, Menomonee, and Milwaukee Rivers, dissect the low areas between the moraines and in places cut moraine highlands where the rivers trend eastward. Bluffs formed of glacial deposits border the Lake Michigan shore at various locations along the eastern edge of the county. The bluffs form prominent highlands often

subject to severe erosional problems. The project site, however, is located in the west-central section of the county within the Lake Border Moraine System. The site is near the crest of a hill that forms the divide between the Kinnickinnic and Menomonee River Watershed.

Soils

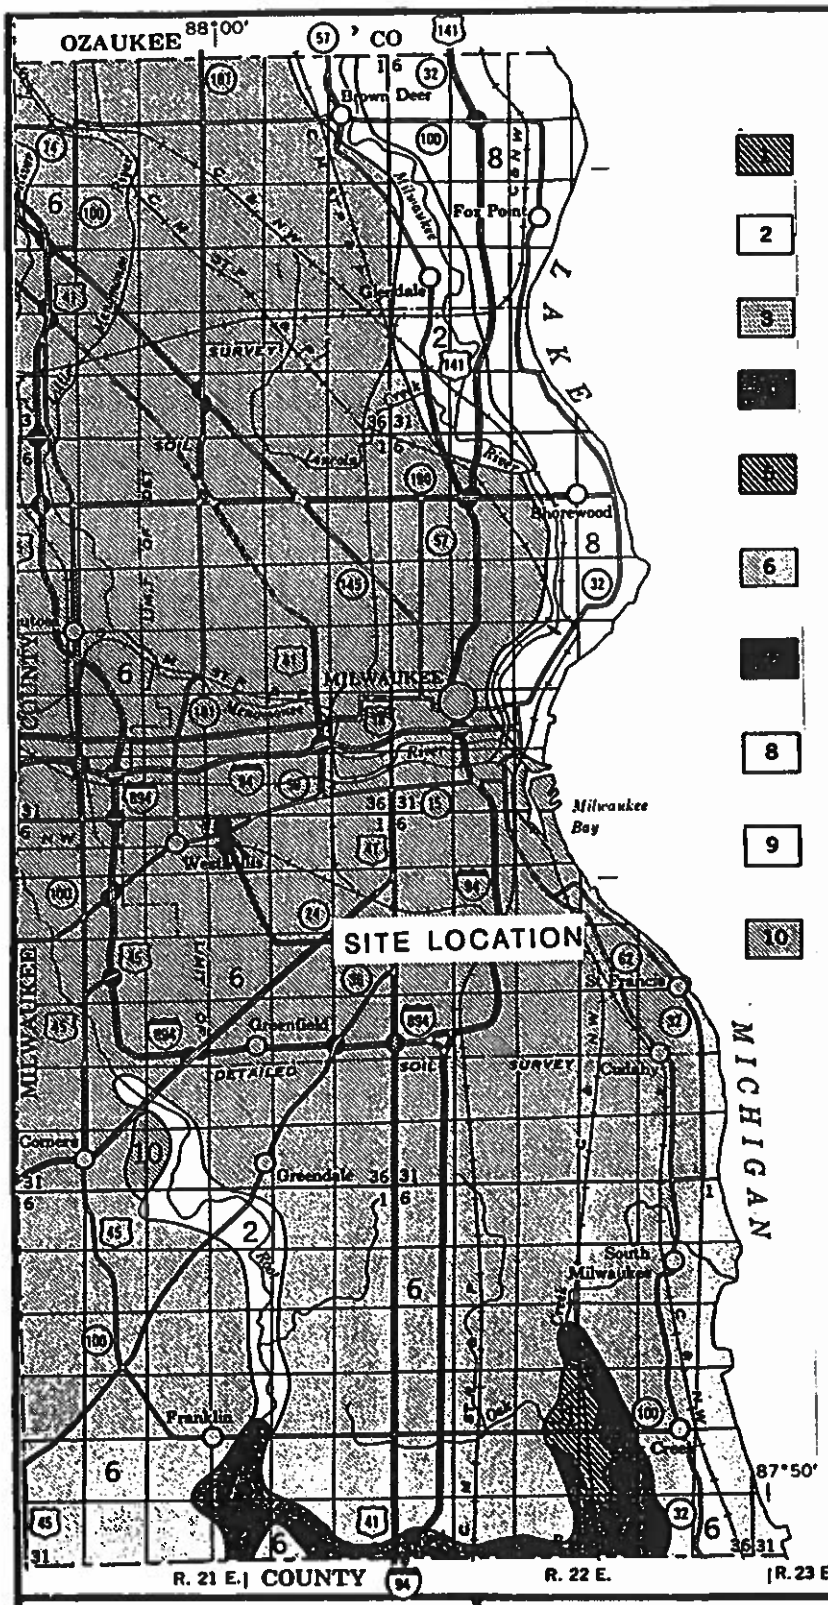
Soils in the Pressed Steel Tank Company area are part of the Ozaukee-Morley-Mequon Association (Figure 3). These soils develop in thin layers of loess over silty clay loam glacial till. The site occurs outside of the area of detailed soils series mapping, yet based on topography and soil association, site soils are probably silty clay loams developed in tills.

Glacial Geology

The landforms and surface deposits of Milwaukee County are a result of glaciations during the Woodfordian and Great Lakean phases of the late Wisconsinan Stage (Pleistocene Series time period) (Figure 4). A series of recessional moraines, formed by the Lake Michigan Lobe, occur in north-trending ridges throughout the county. Deposits are predominantly tills, with minor areas of outwash deposits in the north, east, and south-central parts of the county. Deposits at the site are tills, based upon maps and soils in the excavation. Estimated thickness of the glacial deposits is 200 feet, based on water well contractor reports.

Bedrock

The bedrock units of Milwaukee County are essentially horizontally-bedded Paleozoic sedimentary rock. The northeastern one-seventh of the county is Devonian System dolomites and shales of the Milwaukee Formation (Figure 5). Bedrock in the remainder of the county is Silurian System dolomites. Estimated depth to bedrock at the site is 200 feet below ground surface, based on water well contractor reports.



SOIL ASSOCIATIONS

1 Houghton-Palms-Adrian association: Very poorly drained organic soils in depressions on old lakebeds and on flood plains

2 Fox-Casco association: Well-drained soils that have a subsoil of clay loam; moderately deep to shallow over sand and gravel, on outwash plains and stream terraces

3 Warsaw-Lorenzo association: Well-drained soils that have a subsoil of clay loam; moderately deep over sand and gravel, on outwash plains and river terraces

4 Boyer-Oshtemo association: Well-drained soils that have a subsoil of sandy loam and sandy clay loam underlain by sandy material, on outwash plains

5 Rodman-Casco association: Excessively drained to well-drained soils that have a subsoil of gravelly sandy loam and clay loam; shallow over gravel and sand, on the Kettle Moraine

6 Ozaukee-Morley-Mequon association: Well-drained to somewhat poorly drained soils that have a subsoil of silty clay loam and silty clay; formed in thin loess and silty clay loam glacial till, on moraines

7 Montgomery-Martinton-Hebron-Saylesville association: Poorly drained to well-drained soils that have a subsoil of clay to clay loam; formed in silty clay or silty clay loam sediments, in old lakebeds

8 Kewaunee-Manawa association: Well-drained to somewhat poorly drained soils that have a subsoil of clay and silty clay; formed in thin loess and silty clay glacial till, on moraines and in depressed areas

9 Hochheim-Theresa association: Well-drained soils that have a subsoil of clay loam and silty clay loam; formed in thin loess and loam glacial till, on ground moraines

10 Pella, moderately shallow variant-Knowles association: Poorly drained and well-drained soils that have a subsoil of silty clay loam or clay loam; moderately shallow over dolomite bedrock

HYDROLOGY

Milwaukee County contains parts of the Oak Creek, Milwaukee, Menomonee, and Root River Watersheds, all of the Kinnickinnic River Watershed, and areas adjacent to Lake Michigan that drain directly into the lake. The Oak Creek, Kinnickinnic and Milwaukee Rivers drain the eastern part of the county, whereas the Root and the Menomonee Rivers drain the western part of the county.

Pressed Steel Inc. is located within and near the southern boundary of the Menomonee River Watershed. The boundary with the Kinnickinnic River Watershed occurs along National Avenue in the area of the investigation site. Run-off at the site is expected to be intercepted by stormsewers.

A hydrological budget for Milwaukee County from the U.S.G.S. Hydrological Atlas, based on climatological and environmental data from 1931 to 1960, may be summarized as follows. An average of 29 to 31 inches of precipitation falls on the county. Eight inches of intercepted precipitation leave the county as runoff, and 20 to 23 inches leave as evapotranspiration. Two-tenths of an inch are accounted for as pumpage and groundwater flow out of the county. On average there is no net change in storage calculated for the county. However, there are areas in Milwaukee where significant losses in storage are occurring.

HYDROGEOLOGY

Milwaukee County's hydrogeology is dominated by three aquifers: two bedrock aquifers in Paleozoic sedimentary rock, and a sand and gravel aquifer in unconsolidated outwash deposits. Aquifer properties are summarized in Table 2.

TABLE 2

Water resources	Ground water			
	Sand and gravel aquifer		Niagara aquifer	Sandstone aquifer
	Surficial deposits	Buried deposits	Dolomite	Sandstone and dolomite
Quantity	Large yields as much as 1,200 gpm from conventional wells Specific capacities as much as 50 gpm per foot of drawdown Well depths commonly from 30 to 120 feet Limited areal extent Not used extensively	Small to moderate yields, generally not greater than 125 gpm Well depths commonly from 50 to 480 feet Limited areal extent Not used extensively	Small to large yields, as much as 1,200 gpm Specific capacity for wells ranges from 0.2 gpm per foot to 400 gpm per foot of drawdown Well depths commonly from 75 to 300 feet Underlies most of the basin Used extensively over most of the basin	Large yields are as much as 1,500 gpm Specific capacity of high-capacity wells are as much as 14 gpm per foot of drawdown Well depths commonly from 1,000 to 1,800 feet Underlies entire basin Used extensively for high-capacity wells in the lower one-third of the basin
Quality	Good quality Generally very hard (greater than 180 mg/l hardness) water, but locally hard (about 140 mg/l)	Good quality Generally very hard water, but locally hard	Good quality Generally very hard water but locally soft to moderately hard Highly mineralized locally	Quality varies by area Water hard to very hard Saline in some areas
Special considerations	Water table generally shallow Easily polluted by surface wastes	Water table generally shallow; locally artesian Deposits are often thin Generally not subject to pollution except locally	Water table generally from 50 to 100 feet deep; locally artesian Subject to pollution	Artesian Regional decline in water levels due to pumping in lower one-third of basin Not easily polluted
Suitability	Yields locally adequate for municipal, industrial, and other uses Quality adequate	Yields locally adequate for domestic and small municipal and industrial uses Quality adequate	Yields range from adequate for municipal and industrial uses to adequate for only small domestic uses Quality adequate	Yields adequate for municipal, industrial, and other uses Quality adequate except in local areas having saline water

AQUIFER CHARACTERISTICS
OF SOUTHEAST WISCONSIN

CONSULTING ENGINEERS
GRAEF ANHALT SCHLOEMER & ASSOCIATES INC.
345 North 95th Street
Milwaukee, Wisconsin 53226

Bedrock Aquifers

The deep bedrock aquifer is predominantly Precambrian and Ordovician sandstones and some dolomites, and is generally referred to as the sandstone aquifer. Throughout the county, the sandstone aquifer is confined by an aquiclude, the Ordovician Maquoketa shale. The aquifer is used for high-yield industrial and private wells.

The shallow bedrock aquifer, the Silurian dolomite aquifer, occurs throughout the county. The aquifer, either by itself or in hydraulic connection with the overlying sand and gravel aquifer, forms the water table aquifer and is used for shallow, industrial, and private wells.

Glacial Aquifer

The glacial aquifer is in sands and gravels deposited by Pleistocene ice sheets in spatially discontinuous outwash deposits throughout Milwaukee County. The aquifer is tapped for low yield private and industrial uses.

In Milwaukee County, the sand and gravel and the dolomite aquifers are recharged with waters from rivers and lakes. Depending on changing climate and seasonal weather patterns, recharge occurs where and when there is a net influx of water to an aquifer. More significantly, however, are areas where sands and gravels or dolomites are at or near the surface, and infiltration of precipitation may occur directly through higher permeability soils.

The sandstone aquifer is recharged from four sources. The first is leakage of groundwater from overlying aquifers through the intervening aquiclude, the Maquoketa Shale. Leakage occurs where the shale is thin, fractured, or interbedded with more permeable units. The second source of recharge is through uncased wells that tap both the dolomite and the sandstone aquifers. Flow of water from the dolomite to

the sandstone occurs because of the greater hydraulic head in the dolomite aquifer. The third source of recharge occurs where the dolomite aquifer and the Maquoketa Shale are missing, and groundwater from sands and gravels or precipitation infiltrates into the sandstone. The fourth source of recharge is infiltration of lake or river water into the sandstone aquifer. The third and fourth sources of recharge occur to the west of Milwaukee County, but are the most significant sources of recharce to the aquifer.

The sand and gravel and the dolomite aquifers discharge to streams, inland lakes and Lake Michigan, where and when the net effect of changing weather and climate conditions and aquifer use is an outflux of water. Other discharge areas occur where water is lost through uncased wells and leakage through the Maquoketa Shale to the sandstone aquifer. Additionally, municipal wells, industrial parks, and quarry operations can cause significant discharge areas. The only significant discharge areas of the sandstone aquifer result from high capacity wells.

A selection of water wells located in the Pressed Steel Inc. area are depicted on Figure 6. Water well contractor reports for these wells are contained in Appendix B.

DESCRIPTION OF FIELD ACTIVITIES

Three soil boring will be drilled and sampled using hollow-stem auger drilling techniques. Samples will be collected continuously with a 2-foot split-spoon soil sampler until field screening detects background levels of VOCs or until groundwater is encountered. Once groundwater is encountered a two feet sample will be collected every five feet. VOC concentrations are detected with a portable HNu photoionization detector equipped with a 10.2 electron volt lamp. Each working day the instrument is calibrated before sample screening begins and checked for drift at the end of each day.

S

Soil samples from each split spoon will be divided in half. One part will be put in a Ziploc-type plastic bag and allowed to attain room temperature, which will be noted and recorded. The HNu meter's probe will be inserted into the bag's headspace and VOC levels will then be recorded. The remaining soils will be placed into a Ziploc-type bag and double bagged. The bags will immediately be placed on ice for possible laboratory analysis. Laboratory analysis of soil samples will be for total petroleum hydrocarbons (TPH) and lead. Soil samples submitted for laboratory analysis will be accompanied by a chain-of-custody form.

Groundwater monitoring wells will be installed in the three soil borings where groundwater is encountered. Monitoring well construction will be of schedule 40 PVC pipe and screens. Ten feet of PVC screen will be used for each well, followed by schedule 40 PVC pipe to ground surface. Each well will be constructed as follows: The annulus surrounding the well screen will be packed with filter sand to two feet above above the screen, covered by one foot of fine sand, followed by a 2-foot thick bentonite pellet seal. A bentonite slurry will follow the pellets to within 2 feet below ground surface. The groundwater monitoring wells will be completed by cementing protective well cover in place. Each well will be surveyed to U.S. Geological Survey datum.

Groundwater monitoring wells will be developed before sampling. A Teflon bailer will be used to alternately purge and surge a well until it produces sediment free water or until ten well volumes have been removed or until the well has been bailed dry. The bailer will be cleaned with a trisodium phosphate detergent (TSP) or Alconox and rinsed with distilled water between wells to prevent cross-contamination.

Prior to sampling, wells will be bailed until the water is clear and pH and electrical conductivity values become stable or until five well volumes have been removed. The

bailer will be cleaned with TSP and rinsed with distilled water between wells. Groundwater samples will be taken using a clear Teflon bailer equipped with a bottom emptying device. The bottom third of the bailer volume will be discarded and all samples will be taken from the middle third of the bailer volume. In-field samples will be immediately tested for conductivity, pH, and temperature. The color, turbidity, and odor of the samples will also be noted. Laboratory samples will be collected in 40-milliliter vials fitted with Teflon-lined lids. A positive meniscus will be attained in the vials, the lids will be slid into place, and the cap secured tightly on top to eliminate any headspace. A total of two field-blank samples will be collected. Field-blank samples will be taken half way through and at the end of each sampling day. The samples will consist of distilled water that has been decanted through the cleaned bailer and bottom emptying device. Field-blanks are used to determine the effectiveness of in-field measures taken to prevent cross-contamination of groundwater samples. All samples (including field-blanks) will be placed on ice in an insulated container and sent to a state-certified laboratory for analysis. The samples will be analyzed for benzene, toluene, xylene, and ethylbenzene (BTEX) and lead.

Drilling equipment will be steam cleaned prior to its use on-site. Augers and downhole tools will be steam cleaned between boring locations. Steam cleaning helps prevent cross-contamination. The split-spoon soil sampler will be washed with TSP and double-rinsed with potable water between collection intervals.

DESCRIPTION OF DATA PRESENTATION

A report will be furnished to the WDNR at the conclusion of the on-site investigation. The report will include soil descriptions, results of the HNu field screening, boring logs, well construction and sampling reports, and analytical sample results. A map

will be generated from these results depicting the extent of any contamination. The three monitoring wells will provide groundwater elevations and flow direction. Recommendations for further investigations and or remediation will be made, based on information gathered during this phase of the study.

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was retained by Interstate Pump and Tank (IPT) to perform a tank abandonment assessment of one underground storage tank for Pressed Steel Company, Inc., located at 1445 South 66th Street, West Allis, Wisconsin (Figure 1). The first report, entitled Initial Site Assessment for Removal of One Underground Storage Tank was submitted to the Wisconsin Department of Natural Resources (WDNR) on December 7, 1989. Field screening and the results of l[Boratory testing of soil samples were presented and discussed in the initial site report. Water was encountered below the base of excavations, but no sample were collected because it was not possible to determine whether or not the water was representative of local groundwater or water trapped in the immediate vicinity of the tank soils. Reproductions of this data are contained in Appendices A and B.

BACKGROUND

On September 19, 1989, a 1,000-gallon underground regular gasoline storage tank was removed at Pressed Steel Tank Company Inc. The tank excavation was located in a tightly confined area at the far southeast corner of the property near the intersection of 66th Street and National Avenue (Figure 1). The excavation was surrounded on the east and south sides by a security fence, to the west by a retaining wall and a vault for the sprinkler system, and to the north by a concrete drive. The property boundary is two feet outside the fence (Figure 2).

During excavation, a gasoline odor was noticed at a depth of 3.5 feet. The sand backfill was screened with an HNu Model PI-101 photoionization detector and was found to contain 100+ ppm (parts per million) of volatile organic compounds (VOCs). After removal of the backfill, the perimeter soil material was sampled and screened with the HNu. VOC levels were 60 to 208 ppm.

FIGURE 2

While excavating along the west side of the tank, a storm sewer lateral was encountered at a depth of 5.0 feet, approximately 1.5 to 2.0 feet west of the tank. While removing the tank, the storm sewer lateral was punctured in two places. The section of sewer piping running through the excavation and the contaminated sand that surrounded it were removed. Stained soil was observed around the sections of sewer lateral that extended to the north and south beyond the excavation.

On September 20, 1989, the contractor removed the fence around the pit. The pit was excavated to the limits of the property, and the maximum depth the contractor could reach. Final dimensions of the pit were 20.2 feet by 9.0 feet by 8.5 feet deep. The perimeter material was sampled and screened with the HNu; VOC levels were greater than 50 ppm.

Approximately 45 cubic yards of contaminated soils were stockpiled in the staging area. The soils were placed on an impermeable layer of plastic on top of the asphalt parking lot across 66th street. The edges of the plastic were turned up to prevent precipitation run-off from entering the pile. The soil was also covered by an impermeable layer of plastic to prevent infiltration of precipitation and subsequent leaching of contamination.

Laboratory analysis of a composite soil sample had concentrations of 320 ppm TPH, 830 ppb (parts per billion) benzene, 3,500 ppb ethylbenzene, 6,000 ppb toluene, and 31,000 ppb total xylene. These results are further evidence of soil contamination occuring at the site.

On September 21, 1989, holes were augered into the center of each excavation wall (except the retaining wall) to a distance of 5.0 to 5.5 feet, at a depth of 7.0 to 7.5 feet. Samples were taken, screened with the HNu and sent to the laboratory for analysis of total petroleum hydrocarbons (TPH). Also, a test pit was dug in the

base of the excavation. Water, possibly groundwater, was encountered at a depth of 12.5 feet. However, no sample was collected because of the questionable validity of the samples; water ponded in the surrounding a tank would probably have anomalous chemical constituents that are probably uncorrelatable to groundwater constituent levels. A soil sample was taken, field-screened, and sent to the laboratory for analysis of TPH.

The results of photoionization detector field screening for VOCs are depicted in Table 1. Concentrations were greater than 100 ppm in the initial excavation, from 50 to 60 ppm after overexcavation, and 28 to 63 ppm at a distance of five feet into the walls. VOC concentrations in the base of the excavation increased from 120 ppm at 8.25 feet to 242 ppm at 12.16 feet.

Soil samples collected from a distance of five feet into the walls contained from 24 to 440 ppm gasoline (laboratory interpretation of samples) and a sample from the base of the excavation contained 28 ppm gasoline.

From the field screening and laboratory analysis it is obvious that some petroleum hydrocarbon contamination of site soils has occurred. VOC concentrations increase with depth. Movement of released or spilled product was probably directed downward except where the product encountered zones of higher permeability. For example, gasoline concentrations were greatest to the north, 440 ppm, where movement through the soil along the sewer lateral occurred. Downward directed movement of product is evidenced by the increase in VOC concentrations with depth.

The VOCs detected in the site soils could be a result of: a) residual product, as evidenced by the detected gasoline, b) residual volatiles locked in tight soils, or c) soil gas volatilizing from petroleum product located at depth. In order to determine the

nature and extent of contamination, further investigation of the site is necessary.

DESCRIPTION OF WORK AND OBJECTIVES

The scope of this work includes three soil borings (Figure 2), in which groundwater sampling wells will be constructed. However, soil borings will be drilled to a maximum depth of 40 feet. If no groundwater is encountered at that depth, a well will not be constructed. The objective is to further determine the extent of subsurface soil and possible groundwater contamination at the site. Following completion of the work, results will be furnished in a report format.

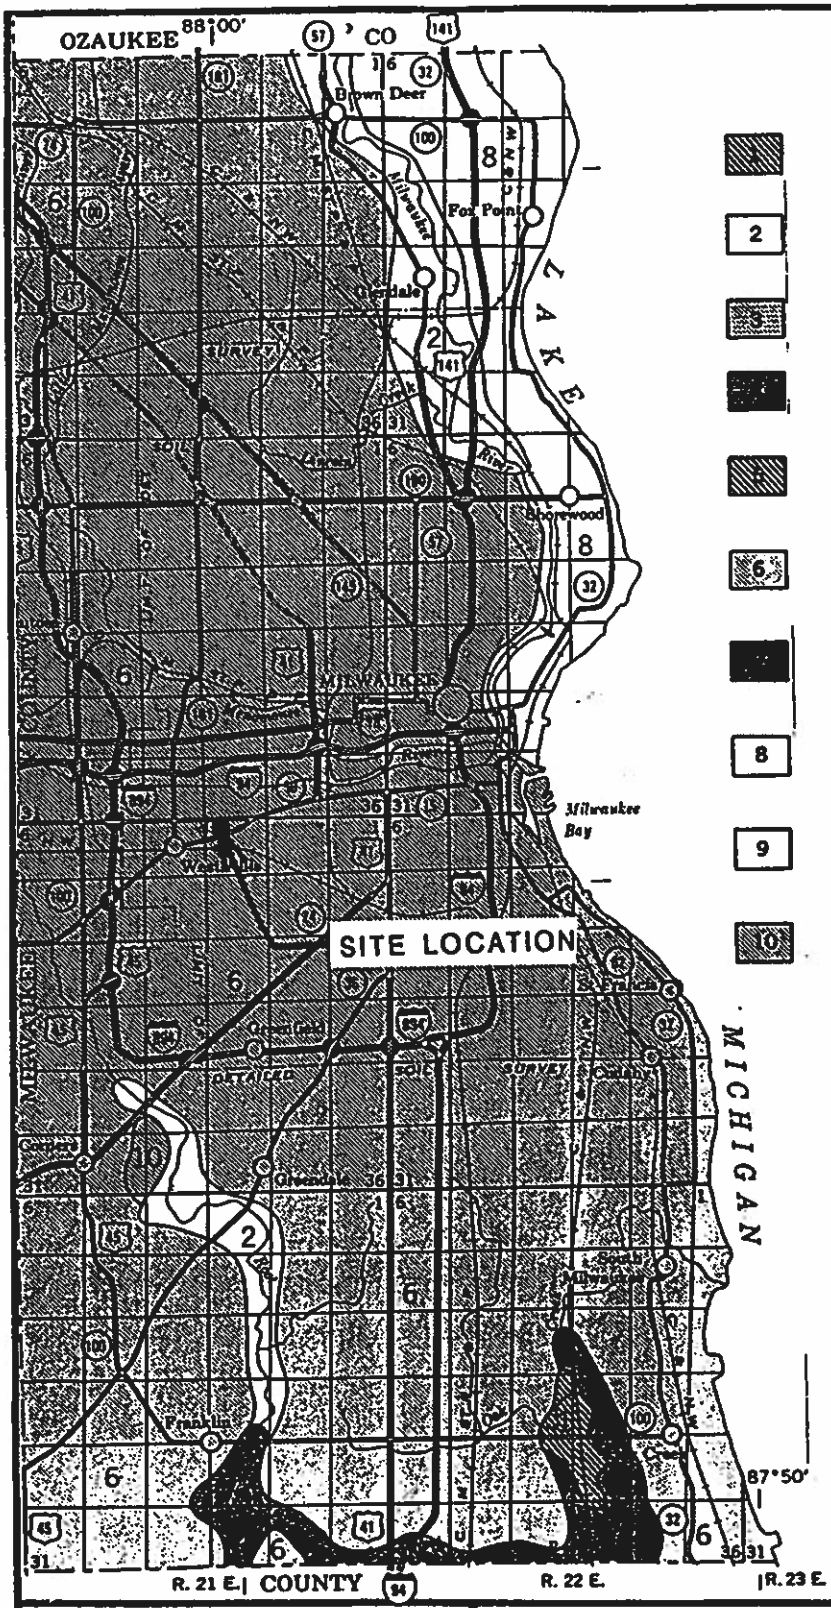
GEOLOGY

Physiography

The physiography of Milwaukee County can be characterized as gently rolling north trending glacial-sculpted hills that roughly parallel Lake Michigan. Three rivers, the Kinnickinnic, Menomonee, and Milwaukee Rivers, dissect the low areas between the moraines and in places cut moraine highlands where the rivers trend eastward. Bluffs formed of glacial deposits border the Lake Michigan shore at various locations along the eastern edge of the county. The bluffs form prominent highlands often subject to severe erosional problems. The project site, however, is located in the west-central section of the county within the Lake Border Moraine System. The site is near the crest of a hill that forms the divide between the Kinnickinnic and Menomonee Rivers.

Soils

Soils in the Pressed Steel Tank Company area are part of the Ozaukee-Morley-Mequon Association (Figure 3). These soils develop in thin layers of loess over silty clay loam glacial till. The site occurs outside of the area of detailed soils series



SOIL ASSOCIATIONS

Houghton-Palms-Adrian association: Very poorly drained organic soils in depressions on old lakebeds and on flood plains

Fox-Casco association: Well-drained soils that have a subsoil of clay loam; moderately deep to shallow over sand and gravel, on outwash plains and stream terraces

Warsaw-Lorenzo association: Well-drained soils that have a subsoil of clay loam; moderately deep over sand and gravel, on outwash plains and river terraces

Boyer-Oshtemo association: Well-drained soils that have a subsoil of sandy loam and sandy clay loam; underlain by sandy material, on outwash plains

Rodman-Casco association: Excessively drained to well-drained soils that have a subsoil of gravelly sandy loam and clay loam; shallow over gravel and sand, on the Kettle Moraine

Ozaukee-Morley-Mequon association: Well-drained to somewhat poorly drained soils that have a subsoil of silty clay loam and silty clay; formed in thin loess and silty clay loam glacial till, on moraines

Montgomery-Martinton-Hebron-Saylesville association Poorly drained to well-drained soils that have a subsoil of clay to clay loam; formed in silty clay or silty clay loam sediments, in old lakebeds

Kewaunee-Manawa association: Well-drained to somewhat poorly drained soils that have a subsoil of clay and silty clay; formed in thin loess and silty clay glacial till, on moraines and in depressed areas

Hochheim-Theresa association: Well-drained soils that have a subsoil of clay loam and silty clay loam; formed in thin loess and loam glacial till, on ground moraines

Pella, moderately shallow variant-Knowles association: Poorly drained and well-drained soils that have a subsoil of silty clay loam or clay loam; moderately shallow over dolomite bedrock

FIGURE 3

mapping, yet based on topography and soil association, site soils are probably silty clay loams developed in tills.

Glacial Geology

The landforms and surface deposits of Milwaukee County are a result of glaciations during the Woodfordian and Great Lakean phases of the late Wisconsinan Stage (Pleistocene Series time period) (Figure 4). A series of recessional moraines, formed by the Lake Michigan Lobe, occur in north-trending ridges throughout the county. Deposits are predominantly tills, with minor areas of outwash deposits in the north, east, and south-central parts of the county. Deposits at the site are tills, based upon maps and soils in the excavation. Estimated thickness of the glacial deposits is 200 feet, based on water well contractor reports.

Bedrock

The bedrock units of Milwaukee County are essentially horizontally-bedded Paleozoic sedimentary rock. The northeastern one-seventh of the county is Devonian System dolomites and shales of the Milwaukee Formation (Figure 5). Bedrock in the remainder of the county is Silurian System dolomites. Estimated depth to bedrock at the site is 200 feet below ground surface, based on water well contractor reports.

HYDROLOGY

Milwaukee County contains parts of the Oak Creek, Milwaukee, Menomonee, and Root River Watersheds, all of the Kinnickinnic River Watershed, and areas adjacent to Lake Michigan that drain directly into the lake. The Oak Creek, Kinnickinnic and Milwaukee Rivers drain the eastern part of the county, whereas the Root and the Menomonee Rivers drain the western part of the county.

Pressed Steel Inc. is located within and near the southern boundary of the Menomonee River Watershed. The boundary with the Kinnickinnic River

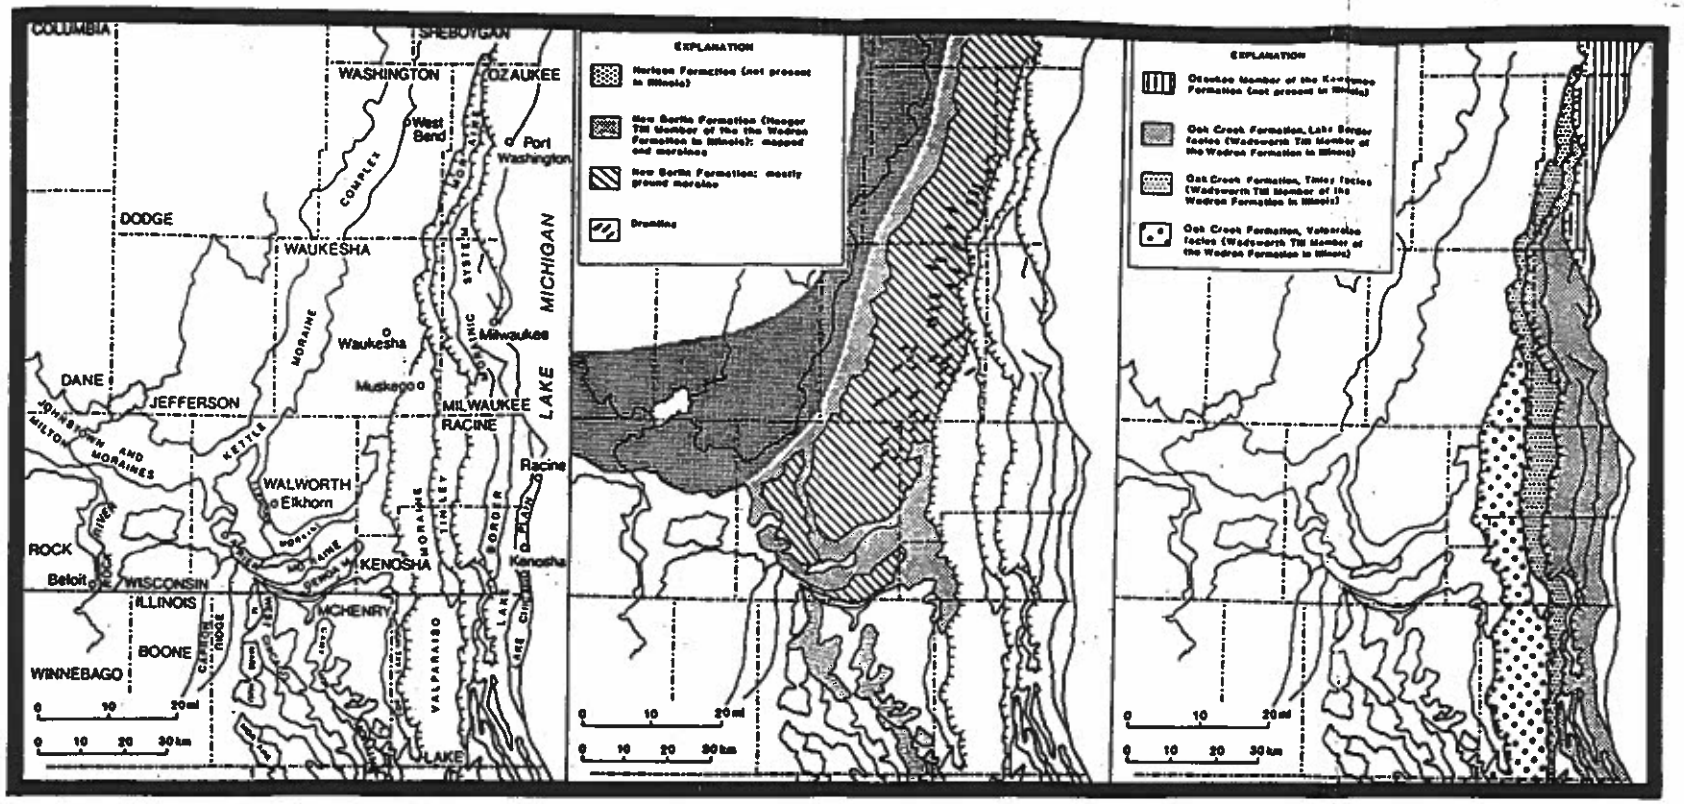

FIGURE 4.--Glacial geology of part of southeastern Wisconsin showing moraines and counties (2a) and distribution of Wisconsinan rock-stratigraphic units (2b, 2c). Moraines as shown do not necessarily represent the interpretations of the author; rather, an attempt is made to show relationships mapped by several workers. Hachured lines represent distal edges of younger rock-stratigraphic units. Wisconsin part compiled from Alden (1904, 1918), Thwaites (1956), Hadley and Pelham (1976), and the author's field maps; Illinois part compiled from Leighton and Willman (1953) and Willman and Frye (1970).

FIGURE 5

Watershed occurs along National Avenue in the area of the investigation site. Run-off at the site is expected to be intercepted by stormsewers.

A hydrological budget for Milwaukee County from the U.S.G.S. Hydrological Atlas, based on climatological and environmental data from 1931 to 1960, may be summarized as follows. An average of 29 to 31 inches of precipitation falls on the county. Eight inches of intercepted precipitation leave the county as runoff, and 20 to 23 inches leave as evapotranspiration. Two-tenths of an inch are accounted for as pumpage and groundwater flow out of the county. On average there is no net change in storage calculated for the county. However, there are areas in Milwaukee where significant losses in storage are occurring.

HYDROGEOLOGY

Milwaukee County's hydrogeology is dominated by three aquifers: two bedrock aquifers in Paleozoic sedimentary rock, and a sand and gravel aquifer in unconsolidated outwash deposits. Aquifer properties are summarized in Table 2.

Bedrock Aquifers

The deep bedrock aquifer is predominantly Precambrian and Ordovician sandstones and some dolomites, and is generally referred to as the sandstone aquifer. Throughout the county, the sandstone aquifer is confined by an aquiclude, the Ordovician Maquoketa shale. The aquifer is used for high-yield industrial and private wells.

The shallow bedrock aquifer, the Silurian dolomite aquifer, occurs throughout the county. The aquifer, either by itself or in hydraulic connection with the overlying sand and gravel aquifer, forms the water table aquifer and is used for shallow, industrial, and private wells.

TABLE 2

Water resources	Ground water			
	Sand and gravel aquifer		Niagara aquifer	Sandstone aquifer
	Surficial deposits	Buried deposits	Dolomite	Sandstone and dolomite
Quantity	Large yields as much as 1,200 gpm from conventional wells Specific capacities as much as 50 gpm per foot of drawdown Well depths commonly from 30 to 120 feet Limited areal extent Not used extensively	Small to moderate yields, generally not greater than 125 gpm Well depths commonly from 50 to 480 feet Limited areal extent Not used extensively	Small to large yields, as much as 1,200 gpm Specific capacity for wells ranges from 0.2 gpm per foot to 400 gpm per foot of drawdown Well depths commonly from 75 to 300 feet Underlies most of the basin Used extensively over most of the basin	Large yields are as much as 1,500 gpm Specific capacity of high-capacity wells are as much as 14 gpm per foot of drawdown Well depths commonly from 1,000 to 1,800 feet Underlies entire basin Used extensively for high-capacity wells in the lower one-third of the basin
Quality	Good quality Generally very hard (greater than 180 mg/l hardness) water, but locally hard (about 140 mg/l)	Good quality Generally very hard water, but locally hard	Good quality Generally very hard water but locally soft to moderately hard Highly mineralized locally	Quality varies by area Water hard to very hard Saline in some areas
Special considerations	Water table generally shallow Easily polluted by surface wastes	Water table generally shallow; locally artesian Deposits are often thin Generally not subject to pollution except locally	Water table generally from 50 to 100 feet deep; locally artesian Subject to pollution	Artesian Regional decline in water levels due to pumping in lower one-third of basin Not easily polluted
Suitability	Yields locally adequate for municipal, industrial, and other uses Quality adequate	Yields locally adequate for domestic and small municipal and industrial uses Quality adequate	Yields range from adequate for municipal and industrial uses to adequate for only small domestic uses Quality adequate	Yields adequate for municipal, industrial, and other uses Quality adequate except in local areas having saline water

Milwaukee, Wisconsin 53226

Glacial Aquifer

The glacial aquifer is in sands and gravels deposited by Pleistocene ice sheets in spatially discontinuous outwash deposits throughout Milwaukee County. The aquifer is tapped for low yield private and industrial uses.

In Milwaukee County, the sand and gravel and the dolomite aquifers are recharged with waters from rivers and lakes. Depending on changing climate and seasonal weather patterns, recharge occurs where and when there is a net influx of water to an aquifer. More significantly, however, are areas where sands and gravels or dolomites are at or near the surface, and infiltration of precipitation may occur directly through higher permeability soils.

The sandstone aquifer is recharged from four sources. The first is leakage of groundwater from overlying aquifers through the intervening aquiclude, the Maquoketa Shale. Leakage occurs where the shale is thin, fractured, or interbedded with more permeable units. The second source of recharge is through uncased wells that tap both the dolomite and the sandstone aquifers. Flow of water from the dolomite to the sandstone occurs because of the greater hydraulic head in the dolomite aquifer. The third source of recharge occurs where the dolomite aquifer and the Maquoketa Shale are missing, and groundwater from sands and gravels or precipitation infiltrates into the sandstone. The fourth source of recharge is infiltration of lake or river water into the sandstone aquifer. The third and fourth sources of recharge occur to the west of Milwaukee County, but are the most significant sources of recharce to the aquifer.

The sand and gravel and the dolomite aquifers discharge to streams, inland lakes and Lake Michigan, where and when the net effect of changing weather and climate conditions and aquifer use is an outflux of water. Other discharge areas occur where water is lost through uncased wells and leakage through the Maquoketa Shale

to the sandstone aquifer. Additionally, municipal wells, industrial parks, and quarry operations can cause significant discharge areas. The only significant discharge areas of the sandstone aquifer result from high capacity wells.

A selection of water wells located in the Pressed Steel Inc. area are depicted on Figure 6. Water well contractor reports for these wells are contained in Appendix B.

DESCRIPTION OF FIELD ACTIVITIES

Three soil boring will be drilled and sampled using hollow-stem auger drilling techniques. Samples will be collected continuously with a 2-foot split-spoon soil sampler until field screening detects background levels of VOCs or until groundwater is encountered. Once groundwater is encountered a two feet sample will be collected every five feet. VOC concentrations are detected with a portable HNu photoionization detector equipped with a 10.2 electron volt lamp. Each working day the instrument is calibrated before sample screening begins and checked for drift at the end of each day.

Soil samples from each split spoon will be divided in half. One part will be put in a Ziploc-type plastic bag and allowed to attain room temperature, which will be noted and recorded. The HNu meter's probe will be inserted into the bag's headspace and VOC levels will then be recorded. The remaining soils will be placed into a Ziploc-type bag and double bagged. The bags will immediately be placed on ice for possible laboratory analysis. Laboratory analysis of soil samples will be for total petroleum hydrocarbons (TPH) and lead. Soil samples submitted for laboratory analysis will be accompanied by a chain-of-custody form.

Groundwater monitoring wells will be installed in the three soil borings where

FIGURE 6

groundwater is encountered. Monitoring well construction will be of schedule 40 PVC pipe and screens. Ten feet of PVC screen will be used for each well, followed by schedule 40 PVC pipe to ground surface. Each well will be constructed as follows: The annulus surrounding the well screen will be packed with filter sand to two feet above above the screen, followed by a 2-foot thick bentonite pellet seal. A bentonite slurry will follow the pellets to within 2 feet below ground surface. The groundwater monitoring wells will be completed by cementing protective well cover in place. Each well will be surveyed to U.S. Geological Survey datum.

Groundwater monitoring wells will be developed before sampling. A Teflon bailer will be used to alternately purge and surge a well until it produces sediment free water or until ten well volumes have been removed or until the well has been bailed dry. The bailer will be cleaned with a trisodium phosphate detergent (TSP) or Alconox and rinsed with distilled water between wells to prevent cross-contamination.

Prior to sampling, wells will be bailed until the water is clear and pH and electrical conductivity values become stable or until five well volumes have been removed. The bailer will be cleaned with TSP and rinsed with distilled water between wells. Groundwater samples will be taken using a clear Teflon bailer equipped with a bottom emptying device. The bottom third of the bailer volume will be discarded and all samples will be taken from the middle third of the bailer volume. In-field samples will be immediately tested for conductivity, pH, and temperature. The color, turbidity, and odor of the samples will also be noted. Laboratory samples will be collected in 40-milliliter vials fitted with Teflon-lined lids. A positive meniscus will be attained in the vials, the lids will be slid into place, and the cap secured tightly on top to eliminate any headspace. A total of two field-blank samples will be collected. Field-blank samples will be taken half way through and at the end of each sampling day.

The samples will consist of distilled water that has been decanted through the cleaned bailer and bottom emptying device. Field-blanks are used to determine the effectiveness of in-field measures taken to prevent cross-contamination of groundwater samples. All samples (including field-blanks) will be placed on ice in an insulated container and sent to a state-certified laboratory for analysis. The samples will be analyzed for benzene, toluene, xylene, and ethylbenzene (BTEX) and lead.

Drilling equipment will be steam cleaned prior to its use on-site. Augers and downhole tools will be steam cleaned between boring locations. Steam cleaning helps prevent cross-contamination. The split-spoon soil sampler will be washed with TSP and double-rinsed with potable water between collection intervals.

DESCRIPTION OF DATA PRESENTATION

A report will be furnished to the WDNR at the conclusion of the on-site investigation. The report will include soil descriptions, results of the HNu field screening, boring logs, well construction and sampling reports, and analytical sample results. A map will be generated from these results depicting the extent of any contamination. The three monitoring wells will provide groundwater elevations and flow direction. Recommendations for further investigations and or remediation will be made, based on information gathered during this phase of the study.

Mr. Jim Julien
Pressed Steel Tank Co. Inc.
P.O. Box 10-J
Milwaukee, WI 53214

Dear Mr. Julien:

RE: Pressed Steel Tank, 1445 S. 66th Street, West Allis, WI

This letter is in response to an Initial Site Assessment Report dated September 1989, submitted to this office by G.A.S. Consultants, detailing assessment work performed on the referenced property.

The report indicates that both soils and groundwater have been impacted by a release of hydrocarbons at the Pressed Steel Tank plant site.

Please have G.A.S. Consultants submit a detailed workplan for further assessment of the site. The assessment should define the vertical and horizontal extent of groundwater and soil contamination, and should conclude with a proposal for remediation.

Enclosed please find WDNR Site Assessment Guidelines for your information.

Sincerely,

Charles J. Krohn
Environmental Response Hydrogeologist

RE: Site Assessment Report For Removal
of One Underground Storage Tank Located at
1445 South 66th Street

Dear Mr. Julian:

Enclosed is one copy of the above referenced Site Assessment Report. Graef, Anhalt, Schloemer & Associates (GAS) was retained by Interstate Pump & Tank (IPT) to supervise the removal of one underground storage tank, and conduct an on-site assessment of the underground tank excavation soils.

Results based on the on-site screening and laboratory analysis of soils from the tank excavations indicate that there is some contamination of the underlying soils at the site. The Wisconsin Department of Natural Resources (WDNR) was notified, and this proposal follows the required process defined by the WDNR.

If you have any questions or require additional information, please call me at (414) 259-1500, extension 66.

Sincerely,

GRAEF, ANHALT, SCHLOEMER
& ASSOCIATES INC.

BUREAU OF SOLID &
HAZARDOUS WASTE MANAGEMENT

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was contracted to perform a site assessment on the abandonment by removal of one underground storage tank at Pressed Steel Tank Company Inc., 1452 South 66th Street, West Allis, Wisconsin (Figure 1).

The purpose of this study was to assess the subsurface conditions surrounding an underground gasoline tank and the associated dispenser and piping at the time of excavation. The excavation involved the removal and disposal of one 1,000-gallon tank. The site assessment followed the Department of Industry, Labor, and Human Relations (DILHR) guidelines for underground tank change of service.

SOIL SAMPLING PROCEDURES

DILHR requirements state that soil samples be taken within or below the excavation at the following locations:

A. At both ends of the tank.
B. Every 20 feet, or segment thereof, along piping runs.
C. Underneath each island on the supply side.
D. At points where strong odors or soil discoloration indicate presence of contamination.
E. If groundwater is encountered within the excavation, a groundwater sample must be taken and analyzed for benzene, toluene, ethylbenzene, and xylene (BTEX).
F. Redundant samples need not be taken.

Representative soil samples were obtained from the walls and bottom of the tank excavation (Figure 2). The samples were split, with one-half being sealed in 1-quart ziploc bags. The duplicate half of the samples were placed in 4-ounce glass jars with Teflon-lined lids, packed on ice, and sent to the laboratory for analysis, accompanied by a chain-of-custody record.

PHOTOIONIZATION DETECTOR READINGS

All soil samples were field-screened with an HNu model PI-101 photoionization detector. The HNu is a portable device capable of detecting the presence of volatile organic compounds (VOC's). It is equipped with a 10.2 electron volt lamp and is calibrated to benzene at the start of each working day.

The HNu field screening process allows soil samples, sealed in Ziploc bags, to warm to ambient temperature. VOC's trapped in the soils volatilize and collect in the headspace of the bag. The HNu probe is inserted and VOC content, in parts per million (ppm), is determined. However, the HNu is only a field screening device; the screening results must be confirmed by lab analysis.

FIELD OBSERVATIONS

On October 27, 1989, Interstate Pump and Tank of Menomonee Falls, Wisconsin removed a 1,000 gallon underground regular gasoline tank at Pressed Steel Tank Company Inc. The tank excavation was located at the northwest corner of building number B. on the east side of 66th Street (Figure 2). The tank was a 1,000 gallon regular gasoline tank, of steel construction installed approximately 35 years ago. Prior to removal, the tank was found to be full of water. The tank was pumped free of water product by National Tank service.

While exposing the tank top, soil samples were screened with an HNu meter. The soils at the 3 to 4 foot depth were found to contain 3.8 to 19.6 ppm of VOC's, using the HNu meter. At a depth of 7 feet, a gasoline odor was noticed and the silty clay backfill material was screened with the HNu. The backfill material was found to contain 52 ppm of VOC's, using the HNu meter (Table 1). The decision was made to remove the tank and then assess the degree of contamination.

After uncovering the tank and exposing the north side, the Contractor pulled the tank out of the pit. While removing the tank, numerous holes and pitting were noticed in the tank shell.

A staging area was designated in one of Pressed Steel Tank Company's parking lots on the other side of the No. B building, south of the project site. The contaminated backfill material was removed from the excavation and piled on plastic and covered, at the staging area.

After removing the backfill material, the perimeter of the excavation was sampled and screened with the HNu. VOC levels ranged from 2.4 to 72 ppm, using the HNu (Table 1). The soil samples were very moist.

The excavation was surrounded on the south side by a building. To the west was the property line, sidewalk and South 66th street. The north side of the excavation contained a water main that was located approximately 5 feet away from the tank.

The pit was excavated to the limits of the property and physical barriers. It was excavated to the maximum depth the Contractor could reach. Final dimensions of the pit were 12 feet long by 9 feet wide by 9 feet deep. The contaminated soils removed from the excavation were piled on the staging area. The VOC levels were 48 ppm to 58 ppm, using the HNu meter (Table 1).

A six inch soil venting sump was installed in the excavation. It was placed in the southern middle of the excavation. The sump is constructed of .10 inch slotted PVC piping.

Scrap disposal records can be found in Appendix B. The tank inventory form can be found in Appendix C. Photodocumentation can be found in Appendix D.

The excavated contaminated soils that are staged on site will be properly permitted and landfilled at a state registered landfill site.

This subsurface assessment is limited to the immediate area surrounding the tank excavation. GAS cannot be held responsible for the documentation of on-site contamination that may be present at other areas of the project site.

This form is to be completed pursuant to Section 101.142, Wis. Stats., to register all underground tanks in Wisconsin that have stored or currently store petroleum or regulated substances. Please see the reverse side for additional information on this program. An underground storage tank is defined as any tank with at least 10 percent of its total volume (included piping) located below ground level. A separate form is needed for each tank. Send each completed form to the agency designated in the top right corner.

This registration applies to a tank that is (check one):
1. ☐ In Use
2. ☐ Abandoned With Product
3. ☐ Abandoned No Product (empty) or With Water
4. ☒ Abandoned - Tank Removed
6. ☐ Abandoned - Filled With Inert Material
7. ☐ Out of Service

BUREAU OF SOLID &
HAZARDOUS WASTE MANAGEMENT

INTRODUCTION

Graef, Anhalt, Schloemer & Associates Inc. (GAS) was contracted to perform a site assessment on the abandonment by removal of one underground storage tank at Pressed Steel Tank Company Inc., 1445 South 66th Street, West Allis, Wisconsin (Figure 1).

The purpose of this study was to assess the subsurface conditions surrounding an underground gasoline tank and the associated dispenser and piping at the time of excavation. The excavation involved the removal and disposal of one 1,000-gallon tank. The site assessment followed the Department of Industry, Labor, and Human Relations (DILHR) guidelines for underground tank change of service.

SOIL SAMPLING PROCEDURES

DILHR requirements state that soil samples be taken within or below the excavation at the following locations:

A. At both ends of the tank.
B. Every 20 feet, or segment thereof, along piping runs.
C. Underneath each island on the supply side.
D. At points where strong odors or soil discoloration indicate presence of contamination.
E. If groundwater is encountered within the excavation, a groundwater sample must be taken and analyzed for benzene, toluene, ethylbenzene, and xylene (BTEX).
F. Redundant samples need not be taken.

Representative soil samples were obtained from the walls and bottom of the tank excavation, under the fill pipe and along the supply lines (Figure 2). The samples were split, with one-half being sealed in 1-quart ziploc bags. The duplicate half of the samples were placed in 4-ounce glass jars with Teflon-lined lids, packed on ice, and sent to the laboratory for analysis, accompanied by a chain-of-custody record.

PHOTOIONIZATION DETECTOR READINGS

All soil samples were field-screened with an HNu model PI-101 photoionization detector. The HNu is a portable device capable of detecting the presence of volatile organic compounds (VOC's). It is equipped with a 10.2 electron volt lamp and is calibrated to benzene at the start of each working day.

The HNu field screening process allows soil samples, sealed in Ziploc bags, to warm to ambient temperature. VOC's trapped in the soils volatilize and collect in the headspace of the bag. The HNu probe is inserted and VOC content, in parts per million (ppm), is determined. However, the HNu is only a field screening device; the screening results must be confirmed by lab analysis.

FIELD OBSERVATIONS

On September 19, 1989, Interstate Pump and Tank of Menomonee Falls, Wisconsin removed a 1,000 gallon underground regular gasoline tank at Pressed Steel Tank Company Inc. The tank excavation was located at the far southeast corner of the property near the intersection of 66th Street and National Avenue. The tank was a 1,000 gallon regular gasoline tank, of steel construction installed approximately 45 - 50 years ago. Prior to removal, the tank was pumped free of any excess product.

While exposing the tank top, no contamination was encountered. However, at a depth of 3.5 feet, a gasoline odor was noticed and the sand backfill material was screened with the HNu. The backfill material was found to contain 100+ ppm of VOC's. The decision was made to remove the tank and then assess the degree of contamination.

While excavating along the west side of the tank, a storm sewer lateral was encountered at a depth of 5.0 feet, approximately 1.5 to 2.0 feet west of the tank. After uncovering the tank and exposing the west side, the Contractor attempted to drag the tank out of the pit. The tank appeared to be in very poor condition, with excessive pitting and corrosion. While raising the tank, product and water escaped through numerous holes in the bottom of the tank shell. The tank was immediately set down on an angle to prevent the remaining product from escaping. The chain was reattached and the tank was removed and set on its side. A commercial absorbent material was used to clean up the product released onto the concrete drive.

A staging area was designated in one of Pressed Steel Tank Company's parking lots on the other side of 66th Street, east of the project site. The contaminated backfill material was removed from the excavation and piled at the staging area.

While removing the tank, the storm sewer lateral was punctured in two places. It was decided to remove the section of sewer piping running through the excavation and remove the contaminated sand that surrounded it.

After removing the backfill material, the perimeter of the excavation was sampled and screened with the HNu. VOC levels were 60+ ppm to 208 ppm (Table 1).

The project site was located at the extreme southeast corner of the property in a tightly confined area. The excavation was surrounded on the east and south sides by a security fence. To the west was a retaining wall and vault for the sprinkler system, and to the north was a concrete drive. Two feet from the outside of the fence is the city sidewalk and boundary of the property (Figure 2).

The following day, September 20, 1989, the Contractor returned and removed the fence. The pit was excavated to the limits of the property and physical barriers. It was excavated to the maximum depth the Contractor could reach. Final dimensions of the pit were 20.2 feet long by 9.0 feet wide by 8.5 feet deep. The contaminated soils removed from the excavation were piled on the staging area. Soil samples were taken from the perimeter of the excavation and screened with the HNu. The VOC levels were all 50 ppm or greater (Table 1).

Approximately 45 cubic yards of contaminated soils were stockpiled in the staging area. The soils were placed on an impermeable layer of plastic on top of the asphalt parking lot. The edges of the plastic were turned up to prevent precipitation run-off from entering the pile. The soil pile was also covered by an impermeable layer of plastic to prevent infiltration of precipitation and subsequent leaching of contamination.

On Thursday, September 21, 1989, GAS returned to the site to conduct horizontal borings into the side walls of the excavation. The borings were conducted using a hand-powered bucket auger. A hole was augered into the center of each excavation wall (with the exception of the concrete retaining wall to the west) at a depth of 7.0 to 7.5 feet. Each hole was augered into the side wall 5.0 to 5.5 feet. A sample was taken, screened with the HNu (Table 2) and sent to the lab for analysis of TPH (Appendix B).

The first hole, Hand Auger 1 (HA-1) was augered in the north wall at a depth of 7.0 feet, 5.5 feet into the side wall of the pit. HNu screening detected 42 ppm and lab analysis indicated 440 ppm TPH (Appendix A).

Hand Auger 2 (HA-2) was bored into the center of the east wall at a depth of 7.0 feet. It reached 5.33 feet into the east side of the excavation. The HNu detected 68 ppm and lab analysis indicated 100 ppm TPH (Appendix A).

Hand Auger 3 (HA-3) was augered in the center of the south wall at a depth of 7.5 feet, extending 5.0 feet into the wall of the pit. The HNu detected 38 ppm and lab analysis indicated 24 ppm TPH (Appendix A).

A test pit was dug along the base of the excavation to determine vertical extent of contamination. The trench was dug to a depth of 12.3 feet with groundwater being encountered at an approximate depth of 12.25 feet. A soil sample was taken just above the groundwater interface at 12.2 feet. The HNu detected 24+ ppm and lab analysis indicated 28 ppm TPH (Appendix A).

CONCLUSION AND RECOMMENDATIONS

The Wisconsin Department of Natural Resources (WDNR) sets a maximum allowance of TPH in soils at 10 ppm. Lab analysis of the soil samples taken with the use of a hand auger beyond the walls of the excavation and a sample taken at the groundwater interface exceeded this limit.

It is recommended that a Phase II investigation be initiated. The purpose of this investigation would be to define the extent of contamination. It would include descriptions of present site conditions, soils, local hydrogeology, and proposed field activities including borings and monitoring well installation. A proposal for this Phase II investigation will be submitted to the WDNR and Pressed Steel Tank Company Inc. for their approval.

UNDERGROUND PETROLEUM PRODUCT TANK INVENTORY

Send Completed Form To:
Safety & Buildings Division
P.O. Box 7969
Madison, WI 53707
Telephone (608) 267-5280

This form is to be completed pursuant to Section 101.142, Wis. Stats., to register all underground tanks in Wisconsin that have stored or currently store petroleum or regulated substances. Please see the reverse side for additional information on this program. An underground storage tank is defined as any tank with at least 10 percent of its total volume (included piping) located below ground level. A separate form is needed for each tank. Send each completed form to the agency designated in the top right corner.

This registration applies to a tank that is (check one):
1 ☐ In Use
2 ☐ Abandoned With Product
3 ☐ Abandoned No Product (empty) or With Water
4. ☒ Abandoned - Tank Removed
6. ☐ Abandoned - Filled With Inert Material
7 ☐ Out of Service

BACKGROUND FOR TANK INVENTORY

On May 4, 1984, legislation commonly known as the Groundwater Protection Act was signed into law. This legislation required the creation of an inventory of underground petroleum product storage tanks. A record of this information was necessitated by numerous reported incidents of groundwater contamination by petroleum products. Many tanks have been installed, used and forgotten. These installations can threaten the groundwater.

This underground tank inventory is being established to help identify the need for future actions required to clear up potential problems before they occur. Your help in identifying abandoned, " in use " and " new use " tank locations will greatly assist this effort to protect Wisconsin's groundwater.

CLEAN CLOSURE INFORMATION

Requirements for clean closure of an out-of-service underground storage tank were outlined in the proposed federal rules in the April 17, 1987 Federal Register, Volume 52, No. 74 at § 280.80 as follows:

> (d) This requirement is satisfied if one of the external monitoring release detection methods allowed under § 280.41 is in use at the site at the time of closure, or if the owner or operator uses:
>
> (1) Portable gas chromatograph mapping;
>
> (2) Analysis of soil core samples for hydrocarbon and /or chemical contamination in the unsaturated zone;
>
> (3) Analysis of groundwater surrounding the tank for released product; or
>
> (4) Another site assessment method that has been approved by the implementing agency.

To record a clean closure, a report of the information and results obtained through the site assessment must be submitted to the following address:

Safety & Buildings Division
P.O. Box 7969
Madison, WI 53707

Milwaukee, WI 53214

SUBJECT: Pending Site Closure:

Pressed Steel Co; BRRTS ID # 0341000421
1445 S 66th St; West Allis, Wisconsin

Dear Responsible Party:

According to our records the Department of Natural Resources (DNR) granted a conditional closure pending the recording of a Groundwater Use Restriction for the above referenced case on November 12, 1999. Since that time, this agency has not received proof that this restriction has been recorded. In light of administrative rule revisions that became effective November 1, 2001, you now have two options for fulfilling this obligation and obtaining final closure. One option is to record a Groundwater Use Restriction at the County Register of Deeds office for your property and for any impacted neighboring properties, if applicable. The other option now available is to have the property placed on the Geographic Information Systems Registry of Closed Remediation Sites (GIS Registry) with the State.

By utilizing the option of placing the information on the GIS Registry, you will not be required to record a Groundwater Use Restriction at the Register of Deeds office. To place the property on the GIS Registry, you will need to accomplish the steps on the attached list.

Please note that, whichever option you choose, you are still required to comply with any other conditions of closure (monitoring well abandonment forms, soil disposal documents, etc.) outlined in the conditional closure approval letter (enclosed) that was sent to you.

Within 30 days of receipt of this notice, please inform this agency which option you intend to pursue. Please be advised that your failure to respond to this letter will be viewed as an admission that you do not intend to pursue final closure of your site. In that situation, we will recommend further enforcement actions be initiated. Enforcement actions could include the recording of an affidavit at the County Register of Deeds office indicating contamination remains, while at the same time issuing an administrative order or making a direct referral to the State Attorney General's Office to recoup our costs and any associated fees that may have been due. Any referral to the State Attorney General's Office could result in forfeitures.

The Department appreciates your efforts to restore the environment at this site and encourages you to take the final steps necessary to get case closure. If you have any questions about this letter, please contact your project manager, Eric Amadi, at (414) 263-8639.

Sincerely,

Victoria Stovall
Remediation & Redevelopment Program Assistant

WisDOT Phase 1 Hazardous Materials Assessment Site Summary
(rev. 2/2016)

Instructions: following FDM 21-35-5, perform site assessment, fill in information for each site investigated. Multiple sites with no identified environmental concerns may be summarized on one form.

Recommendation acceptance/rejection/modification should be completed and signed by the person with the authority to make project decisions (for example: region hazardous materials coordinator, project manager, local road management consultant)

WisDOT Project ID: Project ID 02-41-13-70
Highway/Street: West National Avenue
Termini/Limits: West65th Street toWest 62nd Street
County or Counties: Milwaukee

Property Information:
Site Name(s): Property NO 113 - Pressed Steel
DOT parcel number (if known):
Property Address: 1441 South 65th Street, West Allis, WI. 53214
Owner's Name: City of West Allis
Owner's Address: NA
Owner's Phone: phone number, including area code
Current Land Use: Apartments
Past Land Use: Industrial

Real Estate Requirements:

☐ Contamination discovered at feet during utility or other excavation in the area. Indicate location on site map.
Interview Information or other comments:

Visual Evidence of Potential Contamination: (include additional information in space provided)
☐ No evidence of tanks
☐ USTs ☐ASTs Location, number and condition of tanks, contents, comments:
Location in relationship to current right of way: ☐ map attached
Location in relationship to proposed right of way: ☐ map attached
☐ Drums ☐Stained soils ☐Odor ☐Sheen on surface water ☐Areas of excavation ☐ Areas of fill
☐Stressed vegetation ☐ Pond(s) ☐ Basins/sumps ☐ Monitoring wells ☐ Soil borings
Comments:

Potential for Contaminant Migration: (attach supporting documentation such as plume maps, summaries of site investigation or closure reports).
☒ Property is a potential source of contamination
☐ Adjacent property is a potential source of contamination. Include site name and address or BRRTS number if known, describe location, and include contaminant type and any additional information.
☐ Contaminated soil within proposed right of way from feet to feet below ground surface
☐ Contaminated groundwater within proposed right of way at feet below ground surface.
☐ Contaminated soil or groundwater within existing right of way. Attach copy of most recent investigation and plume maps or DNR form 4400-286 and plume maps.

Attachments – required
☐ Site photographs and a site map showing areas of concern
☐ Plat map showing parcel and any proposed areas of acquisition or easement
☐ Historic aerial photos of site - clearly outline site
☐ Historic WisDOT or other as-builts and plat maps - clearly outline site
☐ Plume maps for known contamination. Indicate existing or proposed right of way on plume maps where applicable.
☒ Closure letter with continuing obligations for sites closed with continuing obligations

Recommendations
☐ No additional hazardous materials investigation is required.
☐ If construction or real estate requirements change, evaluation of need for further investigation will be necessary.
☒ Information is sufficient to use Standard Special Provisions. Copy of completed Standard Special Provision is attached.
☐ Conduct additional investigation
- ☐ Phase 2 (determine if contamination is present)
- ☐ Phase 2.5 (determine extent of contamination within existing R/W only)
- ☐ Phase 3 (determine full extent of contamination prior to acquisition)
- ☐ Phase 4 (remediate site)
- ☐ Other (describe)

☐ Site has continuing obligations. Coordination with DNR will be required.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 07/19/2019 has revealed that there is 1 SEMS site within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 06/24/2019 has revealed that there are 2 CORRACTS sites within approximately 1 mile of the target property.

Federal RCRA generators list

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 06/24/2019 has revealed that there are

4 RCRA-VSQG sites within approximately 0.25 miles of the target property.

State and tribal Brownfields sites

WI BROWNFIELDS: A listing of brownfields sites included in the BRRTS database. Brownfields are abandoned, idle or underused commercial or industrial properties, where the expansion or redevelopment is hindered by real or perceived contamination. Brownfields vary in size, location, age, and past use -- they can be anything from a five-hundred acre automobile assembly plant to a small, abandoned corner gas station.

A review of the WI BROWNFIELDS list, as provided by EDR, has revealed that there are 4 WI BROWNFIELDS sites within approximately 0.5 miles of the target property.

Faclity ID: 241588160
Site Id: 3221300

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: The EPA's listing of Brownfields properties from the Cleanups in My Community program, which provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

A review of the US BROWNFIELDS list, as provided by EDR, and dated 06/03/2019 has revealed that there are 3 US BROWNFIELDS sites within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
NOVAK LIME PIT ACRES property ID: 136970	***1960 S 67TH STREET***	***NW 1/4 - 1/2 (0.286 mi.)***	***K44***	***304***
MILWAUKEE DUCTILE IR ACRES property ID: 151701	1706 S. 68TH ST, 677	NW 1/4 - 1/2 (0.464 mi.)	P71	446

PLATING ENGINEERING ACRES property ID: 78281	1928 S. 62 ST.	NNE 1/4 - 1/2 (0.280 mi.)	J38	243

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 06/24/2019 has revealed that there are 3 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

FUDS: The Listing includes locations of Formerly Used Defense Sites Properties where the US Army Corps Of Engineers is actively working or will take necessary cleanup actions.

A review of the FUDS list, as provided by EDR, and dated 05/15/2019 has revealed that there is 1 FUDS site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
WEHR STEEL COM MIL		E 1/2 - 1 (0.651 mi.)	85	590

WI DRYCLEANERS: Drycleaning facilities enrolled in the Five Star Recognition Program. The primary focus of the Five Star program is to encourage reductions in the use and emissions of perchloroethylene (perc) a common but potentially hazardous drycleaning solvent .Participating cleaners pursue recycling opportunities, spill prevention strategies, more efficient solvent use, and more wet cleaning to reduce their perc consumption.

A review of the WI DRYCLEANERS list, as provided by EDR, and dated 06/11/2019 has revealed that there is 1 WI DRYCLEANERS site within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

EPA Region: 05
Classification: Non-Generator
Description: Handler: Non-Generators do not presently generate hazardous waste

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No

FREMUTS GARAGE (Continued) **1004797844**

User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Historical Generators:
Date form received by agency: 1992-11-30 00:00:00.0
Site name: FREMUTS GARAGE
Classification: Conditionally Exempt Small Quantity Generator

Date form received by agency: 1991-06-03 00:00:00.0
Site name: FREMUTS GARAGE
Classification: Small Quantity Generator

Hazardous Waste Summary:

. Waste code: D001
. Waste name: IGNITABLE WASTE

Violation Status: No violations found

FINDS:

Registry ID: 110005479641

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Action Desc: Date DNR receives the RAOR (a workplan). It identifies and evaluates options to prevent, minimize, stabilize or eliminate threats from the discharged hazardous substances and to restore the environment to the extent practicable.
Action Comments: RA WORK PLAN RECV'D

Action Date: 06/01/2000 Action Code: 76
Action Name: Activity Transferred to DSPS (formerly Commerce)
Action Desc: Oversight of medium or low risk petroleum cleanup has been transferred to the WI Dept of Safety and Professional Services (DSPS). DSPS was part of the Dept of Commerce until 2011.
Action Comments: Not reported

Action Date: 05/15/2002 Action Code: 700
Action Name: Database Fee Paid for Residual Groundwater Contamination
Action Desc: Date Fee received for residual groundwater contamination and related continuing obligations.
Action Comments: Not reported

Action Date: 07/29/2002 Action Code: 84
Action Name: Remaining Actions Needed
Action Desc: Date DNR sends a letter outlining the remaining actions needed to achieve final closure. The site will not be formally closed until receipt of documentation. This action was formerly known as Conditional Closure.
Action Comments: *** Conditional Closure from Commerce Data Interchange ***

Action Date: 10/30/2003 Action Code: 100
Action Name: CO Packet and GIS QAQC Completed
Action Desc: Date that this site had the Continuing Obligations Packet and GIS QAQC completed.
Action Comments: AB

Action Date: 05/15/2002 Action Code: 50
Action Name: GIS Registry Site
Action Desc: Site conditions merit placement on GIS registry.
Action Comments: Autopopulated from 700/710 entry

Action Date: 02/05/2003 Action Code: 236
Action Name: Continuing Obligation - Residual GW Contamination
Action Desc: Closure or ongoing cleanup was approved with the Continuing Obligation for residual groundwater contamination in excess of ch. NR 140 groundwater enforcement standard, to obtain DNR approval before well construction or reconstruction.
Action Comments: *** AUTO POPULATED AT FINAL CLOSURE DUE TO 700 ACTION ***

Action Date: 02/05/2003 Action Code: 11
Action Name: Activity Closed
Action Desc: Date the Closure Letter or No Further Action letter is sent.
Action Comments: *** NR726 Closure from Commerce Data Interchange ***

Action Date: 07/02/2013 Action Code: 89
Action Name: DSPS (formerly Commerce) Transferred Back to DNR
Action Desc: Date the WI Dept of Safety and Professional Services (DSPS) transfers oversight of activity back to the DNR. DSPS was part of the Dept of Commerce until 2011.
Action Comments: PECFA PROGRAM TRANSFER 2013-2015 STATE BUDGET

WEST ALLIS CTY PUBLIC WORKS DEPT (Continued) **S100331541**

Action Date: 03/29/1993 Action Code: 37
Action Name: SI Report Received (w/out Fee)
Action Desc: Date the DNR receives the Site Investigation Report. Provides information regarding activities performed to determine degree & extent of contamination and forming a basis for choosing the appropriate remedial action.
Action Comments: *** SITE INVESTIGATION DETERMINED BY DSPS TO BE COMPLETE - FROM DSPS DATA INTERCHANGE ***

Action Date: 02/05/2003 Action Code: 56
Action Name: Continuing Obligation(s) Applied
Action Desc: Closure or ongoing cleanup was approved with one or more Continuing Obligations to give notice of residual contamination; require or restrict certain actions to protect the public or environment; minimize human or environmental exposures.
Action Comments: AUTO-POPULATED AS REPLACEMENT FOR CODE 50

Registry ID: 110005490389

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System
WI-ESR (Wisconsin - Environmental System Registry) is a database that contains core information about facilities, organizations, and people related to Wisconsin's DNR (Department of Natural Resources).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Actions:

Action Date:	07/02/2013	Action Code:	89

ALLIS AUTOMOTIVE (Continued) **1000879677**

Action Name: DSPS (formerly Commerce) Transferred Back to DNR
Action Desc: Date the WI Dept of Safety and Professional Services (DSPS) transfers oversight of activity back to the DNR. DSPS was part of the Dept of Commerce until 2011.
Action Comments: PECFA PROGRAM TRANSFER 2013-2015 STATE BUDGET

Action Date: 10/01/1999 Action Code: 37
Action Name: SI Report Received (w/out Fee)
Action Desc: Date the DNR receives the Site Investigation Report. Provides information regarding activities performed to determine degree & extent of contamination and forming a basis for choosing the appropriate remedial action.
Action Comments: *** SITE INVESTIGATION DETERMINED BY DSPS TO BE COMPLETE - FROM DSPS DATA INTERCHANGE ***

Action Date: 02/11/1994 Action Code: 2
Action Name: RP Letter Sent
Action Desc: Date of letter to RP notifying of legal responsibilities associated with the discovery of contamination.
Action Comments: RP LETTER

Action Date: 02/23/1994 Action Code: 33
Action Name: Tank Closure Environmental Site Assessment Rpt Received
Action Desc: Date that the DNR received an Environmental Site Assessment of a tank system (above-ground or underground) for tank closure or change in services which usually includes sample results.
Action Comments: TNK CLS/SA REPT RECV'D

Action Date: 08/25/1995 Action Code: 41
Action Name: Remedial Action Report Received
Action Desc: [OBSOLETE] Date the DNR receives the Remedial Action Report detailing remedial action efforts for an activity.
Action Comments: RA REPORT RECV'D

Action Date: 01/13/1994 Action Code: 1
Action Name: Notification
Action Desc: Date the DNR is notified of the discovery of the contamination.
Action Comments: Not reported

Action Date: 10/24/1994 Action Code: 37
Action Name: SI Report Received (w/out Fee)
Action Desc: Date the DNR receives the Site Investigation Report. Provides information regarding activities performed to determine degree & extent of contamination and forming a basis for choosing the appropriate remedial action.
Action Comments: SI REPORT RECV'D

Action Date: 12/04/1995 Action Code: 39
Action Name: Remedial Action Options Report received (w/out Fee)
Action Desc: Date DNR receives the RAOR (a workplan). It identifies and evaluates options to prevent, minimize, stabilize or eliminate threats from the discharged hazardous substances and to restore the environment to the extent practicable.
Action Comments: RA WORK PLAN RECV'D

Action Date: 09/22/1995 Action Code: 45
Action Name: Form 4 Approved

ALLIS AUTOMOTIVE (Continued) **1000879677**

Action Desc: [OBSOLETE] Date the DNR signs the Form 4, PECFA request for reimbursement for actions taken in accordance with s101.143.
Action Comments: FORM 4 APPROVED

Action Date: 09/28/1999 Action Code: 76
Action Name: Activity Transferred to DSPS (formerly Commerce)
Action Desc: Oversight of medium or low risk petroleum cleanup has been transferred to the WI Dept of Safety and Professional Services (DSPS). DSPS was part of the Dept of Commerce until 2011.
Action Comments: PER CONSULTANT REQUEST

Action Date: 11/23/1999 Action Code: 84
Action Name: Remaining Actions Needed
Action Desc: Date DNR sends a letter outlining the remaining actions needed to achieve final closure. The site will not be formally closed until receipt of documentation. This action was formerly known as Conditional Closure.
Action Comments: *** Conditional Closure from Commerce Data Interchange ***

Action Date: 02/02/2000 Action Code: 11
Action Name: Activity Closed
Action Desc: Date the Closure Letter or No Further Action letter is sent.
Action Comments: *** NR726 Closure from Commerce Data Interchange ***

Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Hazardous Waste Summary:

. Waste code: D001
. Waste name: IGNITABLE WASTE

Violation Status: No violations found

FINDS:

Registry ID: 110005410527

Environmental Interest/Information System
WI-ESR (Wisconsin - Environmental System Registry) is a database that contains core information about facilities, organizations, and people related to Wisconsin's DNR (Department of Natural Resources).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Actions:

Action Date: 03/01/2007 Action Code: 661
Action Name: VPLE Application Received with Fee
Action Desc: Date DNR received an application to the Voluntary Party Liability Exemption (VPLE) process and a fee was paid for review. The VPLE process is an elective environmental cleanup program implemented by DNR and described in s. 292.15 Wis. Stats.
Action Comments: REC'D CK# 13750 $250.00

Action Date: 04/20/2010 Action Code: 678
Action Name: VPLE Full Certificate of Completion Process Started
Action Desc: Date DNR determined that all cleanup activities associated with a property enrolled in the Voluntary Party Liability Exemption (VPLE) process have been approved for final closure and DNR has begun to prepare the final Certificate of Completion (COC).
Action Comments: Not reported

Action Date: 03/20/2007 Action Code: 664
Action Name: VPLE Application Approved
Action Desc: Date DNR notified applicant in writing that they are eligible to enter into the Voluntary Party Liability Exemption (VPLE) process.
Action Comments: CHECK REC'D FOR $3,000.00

Action Date: 04/15/2009 Action Code: 99
Action Name: Miscellaneous
Action Desc: Miscellaneous Action - See Action Comments
Action Comments: RECD REVISED MATERIAL HANDLING AND CAP MAINTENANCE PLAN

Action Date: 03/20/2007 Action Code: 667
Action Name: VPLE Advance Deposit Received
Action Desc: Date DNR received the advance deposit for a site that has been approved for the Voluntary Party Liability Exemption (VPLE) process. The amount of the deposit depends on the size of the property. This is used to cover DNR oversight costs.
Action Comments: Not reported

Action Date: 03/20/2009 Action Code: 673
Action Name: VPLE Phase I and II Environmental Assessment Approved
Action Desc: Date DNR approved the Phase I and II Environmental Assessment of the entire property enrolled in the Voluntary Party Liability Exemption (VPLE) process.
Action Comments: Not reported

Action Date: 05/14/2009 Action Code: 679

JUNEAU HIGHLANDS BUSINESS PARK (Continued) **S103079985**

Action Name: VPLE Complete Environmental Investigation Complete
Action Desc: Date DNR determined that the environmental investigation of an entire property enrolled in the Voluntary Party Liability Exemption (VPLE) process is complete (as defined in s. 292.15). The voluntary party is notified via written or verbal communication.
Action Comments: CONDITIONAL APPROVAL

Action Date: 07/16/2010 Action Code: 680
Action Name: VPLE Full Certificate of Completion Not Issued
Action Desc: Date DNR determined that a request for a Certificate of Completion (COC) is not approved for a property enrolled in the Voluntary Party Liability Exemption (VPLE) process. The voluntary party is notified via written or verbal communication.
Action Comments: NEED TO INSTALL CAP AND PURCHASE VPLE INSURANCE

Action Date: 05/20/2013 Action Code: 672
Action Name: VPLE Oversight Review Fee Received
Action Desc: Date DNR received VPLE oversight review fee.
Action Comments: INV #295672 $3,100 PAID

Action Date: 05/10/2013 Action Code: 671
Action Name: VPLE Oversight Billing Sent
Action Desc: Date DNR sent an oversight billing statement to the VPLE site.
Action Comments: INV #295672 $3,100 (03/28/09 - 03/23/13)

Action Date: 10/13/2014 Action Code: 99

Property Description:	original development dates back to the early 1900s. There have been numerous former owners. The site was industrial and carbide gas was the major product produced. lime slurrry, a by-product, was placed in onsite lagoons. The lime posed a direct contact and storm water runoff threat that has been addressed through remedial action.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

WI-ESR (Wisconsin - Environmental System Registry) is a database that contains core information about facilities, organizations, and people related to Wisconsin's DNR (Department of Natural Resources).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110005506773

Environmental Interest/Information System

WI-ESR (Wisconsin - Environmental System Registry) is a database that contains core information about facilities, organizations, and people related to Wisconsin's DNR (Department of Natural Resources).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System

BAKERS CITGO (Continued) **1000839422**

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Registry ID: 110005441646

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.
