NOTES FOR PREFABRICATED WOOD TRUSSES:

1. All prefabricated wood trusses shall be designed for the applicable loads & span parameters by the truss contractor. DILHR requires shop drawings with engineering data for such trusses with a stamp and signature of a registered professional engineer from the State of Wisconsin.
   The following data for wood trusses must be followed for the design.
   - Wood Truss Profile Data
     - See framing plans for superimposed design loads.
     - Truss spacing = (see framing plans)
     - Live load deflection: L/360 or better
2. Provide necessary temporary and permanent bracing/bridging for support of trusses. Follow appropriate erection procedures relative to number of trusses, erected temporary/permanent bracing/bridging based on prevailing weather conditions (wind, snow, ice, etc.). A/E shall not be responsible for any consequences for inadequate bracing/bridging.
3. Contractor shall adequately guy and brace all structural components to maintain safety and alignment during all phases of construction. Such guying and bracing shall remain in place until the structure has reached adequated strength and is permanently braced.
