STH 65 HIGHWAY SAFETY MANUAL ANALYSIS
EXECUTIVE SUMMARY

AECOM completed a safety analysis for 14.1 miles of STH 65 between the St. Croix County Line and USH 8 in Polk County, WI for the Wisconsin Department of Transportation Northwest Region. The objective of this project was to prepare a prioritized list of roadway improvements on STH 65 by applying Highway Safety Manual (HSM) procedures to the corridor.

Applying the HSM involves five major steps: segmentation, diagnosis, selection of countermeasures, economic appraisal, and prioritization of projects.

The STH 65 corridor was divided into 9 large segments for analysis. 27 horizontal curves were analyzed individually. Crash data, crash reports, and crash diagrams were analyzed to identify crash patterns throughout the corridor. Some emerging trends included a high proportion of lane departure crashes (80.8%), speed related crashes (45.2%), weather related crashes (34.2%), and negotiating-a-curve related crashes (39.7%). A majority of the crash rates calculated for the 9 segments of STH 65 were greater than the state average crash rates for similar roadway type.

Roadway deficiencies were identified from these crash trends. Sources of safety concerns include horizontal and vertical curves, backslopes and foreslopes, shoulder width, signing, pavement condition and friction, and speeding. In order to mitigate these deficiencies, the following countermeasures were considered:

- Centerline rumble stripEs
- Update signing to MUTCD standards
- Shoulder rumble strips
- Edgeline rumble stripEs
- Widen shoulder width to 6 feet
- Modifying the vertical alignment
- Chevrons
- Speed reducing pavement markings
- Flashing beacons on wooden posts
- Guardrail
- Skid resistant pavement
- Flattening horizontal curves

HSM procedures were applied to determine potential crash reductions for each countermeasure. Crash reductions were converted to a monetary value by multiplying the reduction by comprehensive societal crash costs. The cost to construct each improvement was calculated and a benefit cost ratio (BCR) was determined.

Finally, countermeasures were ranked using the incremental BCR analysis procedure in the HSM. All safety improvements with a BCR greater than 1 were included in an incremental BCR analysis to prioritize the projects. The results of this analysis are in Exhibit 10, Prioritized Improvements.

This analysis has identified a series of safety improvements that are expected to provide the region the most safety benefit per dollar for the STH 65 corridor. We recommend projects be considered that implement the safety improvements listed in Exhibit 10 with the exceptions and refinements documented in the report recommendation.

STH 65 HIGHWAY SAFETY MANUAL ANALYSIS

AECOM completed a safety analysis of the STH 65 corridor between the St. Croix County Line and USH 8 in Polk County, WI for the Wisconsin Department of Transportation Northwest Region. The project corridor is 14.1 miles in length. A project location map is in Exhibit 1, Project Location Map.

The objective of this project was to prepare a prioritized list of roadway improvements on STH 65 by applying Highway Safety Manual (HSM) procedures to the corridor.

Existing Conditions

STH 65 is a rural two lane undivided roadway with a posted speed limit of 55 mph (60 mph design speed) and rolling terrain. The roadway typical section includes 12 foot lanes and paved or gravel shoulders with a width of between one and two feet. STH 65 is functionally classified as a minor arterial. There are an average of six driveways per mile and a total of 21 intersections throughout the project length. The surrounding land use is predominantly farmland and forest with some wetland areas.

The intersection of STH 65 and CTH K was recently reconstructed and was not included in this analysis. Additionally, a Highway Safety Improvement Program (HSIP) project was recently programmed for a 0.6 mile section of STH 65 from 40th Avenue to the north through a series of sharp curves. This section of STH 65 was also not included in our analysis.

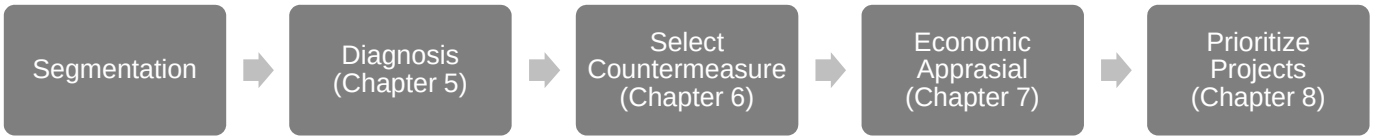
Data

Data was collected from the Wisconsin Department of Transportation Northwest Region for use in this safety analysis. This data includes:

- AADT Traffic Counts (2009)
- AADT Traffic Forecast (2018, 2028, & 2038)
- Crash Data: January 2005 - June 2011 (6.5 years)
- Crash Reports
- Crash Diagrams
- As-Built Construction Drawings
- R/W Plats
- Photo log
- Topographic Map
- Functional Classification Map from 2009
- Meta-Manager data was used to aid in the segmentation process and to determine shoulder widths.

Application of the Highway Safety Manual

The HSM, developed by the American Association of State Highway and Transportation Officials (AASHTO), provides users with quantitative information for decision making by using a predictive approach to safety. Historically, safety analysis has been completed using a reactive approach based on existing crash trends. HSM procedures produce an expected average crash frequency as a function of historical crash data, geometric features of the road, length of road, and AADT of the roadway. Chapters 4-9 of the HSM describe the roadway safety management process. For this analysis, the procedures in chapters 5-8 were completed. Chapter 4 is the network screening procedure and wasn't needed since the project location was already selected. Chapter 9 is the Safety Effectiveness Evaluation procedure. This procedure should be completed once the project is complete to measure its effectiveness. The remaining HSM procedures were completed in the following steps.



Segmentation

The first step in applying HSM procedures is to divide the project corridor into homogenous segments. WisDOT's Meta-Manager database was used to develop initial segmentation. Meta-Manager segmentation is created from the following sources. Figure 1 shows a sample segmentation.

1. *Traffic segments*; traffic segments are roadway divisions based on traffic volumes.
2. *Pavement Information File (PIF) Data*; PIF data divides roadways into sections based on pavement ride and distress.

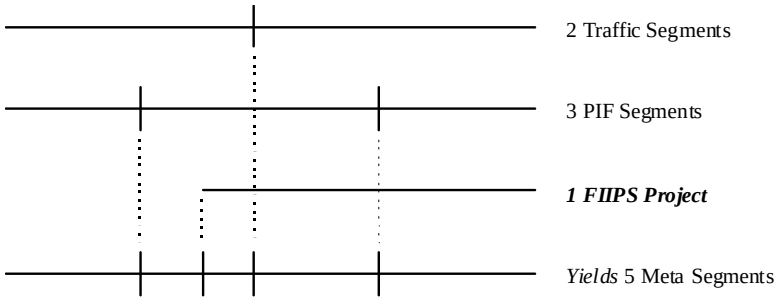


Figure 1. Meta-Manager Segmentation

3. *FIIPS Projects,* Roadways included in FIIPS improvement projects are their own segment.

To segment the STH 65 corridor, Meta-Manager segments were combined and segment divisions were adjusted to create nine segments with similar crash trends, roadway geometrics and roadway features. The STH 65 corridor segmentation is in Exhibit 2, Curve Advisory Speeds & Corridor Segmentation.

Horizontal curves with a radius less than 10,000 feet were also identified. University of Wisconsin-Madison Traffic Operations & Safety Laboratory (TOPS Lab) recently completed a study that found that curves with a radius greater than 10,000 feet didn't exhibit the same safety concerns as smaller radius curves. Horizontal curves are in Exhibit 2, Curve Advisory Speeds & Corridor Segmentation and labeled by station number of the PI of the curve.

Diagnosis

Descriptive Crash Statistics

The next step involved analyzing crash data, crash reports, and crash diagrams to identify trends. There were 84 crashes within the project limits during the analysis period, not including deer crashes. The crashes located within the HSIP project limits were included in the corridor crash analysis. The eleven crashes that occurred at the STH 65 & CTH K intersection were removed for the corridor crash analysis because of the recent improvement project at this location. The remaining 73 crashes were used in trend identification for the corridor. Crash severity was analyzed where:

- K = fatality
- A = incapacitating injury
- B = non-incapacitating injury
- C = possible injury
- PDO = property damage

A summary table of crash statistics and crash diagrams are in Exhibit 3-1, Descriptive Crash Statistics and Exhibit 3-2, Crash Diagrams. Significant corridor crash trends included:

- 15.1% K+A crashes
- 65.8% Injury crashes
- 80.8% Lane departure crashes
- 79.5% Single vehicle run-off-road crashes
- 39.7% Negotiating a curve
- 30.1% Night crashes
- 45.2% Speeding / too fast for conditions
- 34.2% Weather related crashes
- 21.9% Motorcycle crashes
- 13.7% Alcohol Related

Crash Rate

State trunk highway crash rates are reported for the 12 functional peer groups used by Meta-Manager. STH 65 is included in peer group 5, classified as “Rural STN ADT between 750 and 2000 ADT”. These crash rates do not include deer crashes. A comparison of crash rates for peer group 5 and the calculated crash rates per segment on STH 65 are in Table 1 below. A rate flag has also been identified for each segment; those highlighted in red indicate segments with crash rates higher than one standard deviation above the state trunk highway crash rates. The rate flag was calculated using the same method as Meta-Manager.

	Segment Crash Rates									Peer Group 5 Crash Rate
Crash Severity	1	2	3	4	5	6	7	8	9	Average
Total	140	154	399	123	51	270	0	77	189	**105**
K+A	20	0	116	0	17	162	0	0	27	**10**
Injury (K, A , B, C)	70	108	270	86	34	216	0	58	135	**42**
PDO	70	46	129	37	17	54	0	19	54	**63**
Rate Flag	1.02	1.06	2.81	0.88	0.35	1.50	0.00	0.51	1.19	

Table 1. Segment crash rates (crashes per 100 million vehicle miles traveled) and rate flags.

Identifying Deficiencies

The observed crash trends were used in identifying roadway deficiencies that may have contributed to these trends. A variety of resources were used to identify deficiencies including historical crash data, field observations, photo log, as-built plans, and input from WisDOT staff. Deficiencies related to the following roadway attributes were identified:

- Stopping sight distance on vertical curves
- Stopping sight distance on horizontal curves
- Superelevations
- Curve advisory speeds
- Foreslopes and backslopes
- Signing
- Warning sign distance in advance of curves

The following roadway attributes are not deficient, but may lead to safety concerns:

- Horizontal curve radii
- Shoulder width (paved and gravel)
- Poor pavement condition – structural distress and aging
- Inadequate pavement friction
- Driver behavior was a contributing factor in a number of crashes. Due to the rolling terrain and high number of curves, STH 65 is a popular “racing” route for motorcyclists and sports car drivers.

Intersections were also analyzed for deficiencies. There were few crashes that occurred at intersections within the project limits - only four intersections had more than one crash during the analysis period: CTH C, CTH F, Kennedy Mill Ave, and USH 8. The crashes that occurred at the CTH C intersection were due to the presence of a horizontal curve and crashes at the intersection of CTH F were due to a vertical curve north of the intersection. These vertical and horizontal curve deficiencies are part of the segment analysis. The USH 8 intersection had acceptable sight distance, sight triangles, signage, and an average annual crash rate of 0.24.

Based on these factors, these three intersections were not included in the HSM predictive analysis.

The Kennedy Mill Ave intersection is a T intersection where the north and west legs are STH 65 and the east leg is Kennedy Mill Ave. Since STH 65 "turns" at the intersection, STH 65 is not controlled and has a short turn radius, while Kennedy Mill Ave is stop controlled. An HSM analysis was completed to determine if this intersection could benefit from intersection reconfiguration.

STH 65 & Kennedy Mill Road Intersection

Countermeasures

Identifying Countermeasures

Countermeasures were identified to address the observed deficiencies. Resources used to develop the list of countermeasures include the HSM, NCHRP 500 series, FHWA speed management program, and FHWA Low Cost Treatments for Horizontal Curves. The following list of countermeasures was developed and refined with input from WisDOT staff:

Corridor segment applications:

- Install centerline rumble stripEs
- Update signing to MUTCD standards
- Install shoulder rumble strips (would require construction of a paved shoulder)
- Install edgeline rumble stripEs
- Widen shoulder width to 6 feet (3 feet paved, 3 feet gravel)
- Modify vertical alignment to flatten vertical curves with insufficient stopping sight distance

Horizontal curve applications:

- Install Chevrons
- Install speed reducing pavement markings (pavement markings in the traveled lane with variable spacing that cause drivers to slow based on their perception of speed)
- Install Solar powered flashing beacons to supplement advance curve signs
- Install Guardrail
- Install skid resistant pavement overlay (0.5 inch asphaltic overlay)
- Flatten horizontal curves

Expected Crash Frequency

The first step in applying countermeasures is to establish a baseline crash frequency for the existing road. This was completed using a safety performance function (SPF) per HSM procedures. The SPF for rural two-lane two-way roads was used for this project. The SPF is a regression equation that calculates the predicted average crash frequency based on AADT and segment length and modified for specific site conditions through the use of crash modification factors (CMFs). CMFs may be used to account for lane widths, shoulder widths, lighting presence, access density, etc.

A calibration factor should be applied to the SPF in order to adjust the SPF for local conditions and factors, such as climate, driver population, crash reporting thresholds, and crash reporting system procedures. Calibration factors should be developed based on crash data from a minimum of 30-50 sites with similar attributes. The UW TOPS Laboratory is in the process of developing calibration factors, but they are not yet complete. As a result, a calibration factor of 1 was used for this analysis. Without calibration, the calculated crash frequency will not be adjusted for local conditions, but the prioritization of improvements will not be affected.

The accuracy of the predicted average crash frequency for each segment of STH 65 can be improved by using observed crash data to modify the predicted crash frequency using the Empirical Bayes (EB) method. By using the EB method, the predicted average crash frequency and observed crash frequency are combined and weighted based on the variance of the SPF to produce the expected crash frequency.

$$N_{expected} = w * N_{predicted} + (1 - w) * N_{observed} \quad \text{(HSM C-8)}$$

$N_{expected} = estimate\ of\ expected\ average\ crash\ frequency\ for\ study\ period$
$N_{predicted}$
$= predictive\ model\ estimate\ of\ predicted\ average\ crash\ frequency\ for\ the\ study\ period$
$N_{observed} = observed\ crash\ frequency\ at\ the\ site\ over\ the\ study\ period$
$w = weighted\ adjustment\ to\ be\ placed\ on\ the\ SPF\ prediction$

For this analysis, the expected average crash frequency was divided into severity levels K, A, B, C, and PD, whereas the HSM divides crash frequency into fatal/injury and PDO. The HSM provides a default distribution for crash severity based on national research, but encourages the use of a crash severity distribution based on crash history for the project corridor. A crash severity distribution specific to the STH 65 corridor was developed and is in Table 2 below.

Crash Type	Total Crashes	Crash Severity				
		K	A	B	C	PDO
Angle	11.0%	0%	0%	6.9%	0%	4.1%
Rear	1.4%	0%	0%	0%	0%	1.4%
Sideswipe/Opposite Direction	6.8%	1.4%	2.7%	0%	2.7%	0%
Ran off Road	80.8%	4.1%	6.9%	20.5%	20.5%	28.8%

Table 2. Crash severity distribution

Expected crash frequency was calculated for existing conditions and for a no-build condition with future traffic. The existing conditions model uses 2009 AADT traffic volumes, and the no-build model with future traffic uses interpolated 2023 forecasted traffic volumes. 2023 was selected as the analysis year for the no-build condition because it's the median year in the 10-year timeframe used in the economic appraisal. More information on the economic appraisal is included later in this report. A summary of predicted, observed, and expected average crash frequencies are in Exhibit 4-1, Segment Crash Frequencies Under Existing Conditions – 2009 & 2023 and Exhibit 4-2, Curve Crash Frequencies Under Existing Conditions – 2009 & 2023

Crash Modification Factors

The crash benefit of each countermeasure is determined by modifying the SPF to account for the changes that result from implementing the countermeasure. If the effects of the countermeasure are not quantifiable within the SPF, the crash benefit of the countermeasure is determined by multiplying the expected number of crashes by a CMF found in Part D of the

HSM or from other resources such as the online CMF clearing house website. The crash benefit of the following countermeasures was determined through modification of the SPF:

- Install centerline rumble stripEs
- Widen shoulder width to 6 feet
- Flatten horizontal curves
- Repave with proper superelevation rates

The crash benefit of the remaining countermeasures is in Table 3 below:

Countermeasure	CMF				
	All	Injury	PDO	Source*	Application
Update signing to MUTCD standards	-	0.85	0.93	CH	All Crashes
Install shoulder rumble strips/ Edgeline rumble stripEs	0.87	0.82	-	CH	Run-Off-Road Crashes
Modify vertical alignment	0.80	0.49	-	CH	All Crashes
Install chevrons	0.96	0.84	-	CH	All Crashes on Curve
Install speed reducing pavement marking	0.68	-	-	CH	All Crashes on Curve
Install solar powered flashing beacon to supplement advance curve signing	0.929	-	-	CH	All Crashes on Curve
Install guardrail	0.93	0.56 (K) / 0.53 (ABC)	-	CH	Run-Off-Road Crashes on Curve
Install skid resistant pavement overlay (0.5 inches)	0.684	-	-	CH	All Crashes on Curve
Construct safety edge	0.943	-	-	FHWA	All Crashes

* CH: CMF Clearing House; FHWA: Safety Evaluation of the Safety Edge Treatment (FHWA-HRT-11-025)

Table 3. Countermeasure part D CMFs

CMFs from Part D of the HSM, the CMF Clearinghouse, or other resources are meant to be applied independently of other CMFs. The HSM suggests the use of engineering judgment to determine if applying more than one CMF to a SPF will overestimate crash reduction. In general, no more than three CMFs should be applied to a SPF.

Expected Crash Reduction

The expected crash reduction is the difference in the expected crash frequency between the no-build condition and the improved condition with countermeasure. This was calculated for each countermeasure independently of other countermeasures for each segment and curve within the project corridor. The expected crash reduction was calculated for all crashes and divided

into reductions for each crash severity. The predicted, observed, and expected average crash frequencies for flattening horizontal curves are in Exhibit 5-1, Crash Frequency- Flattening Horizontal curves. Expected crash reductions are in Exhibit 5-2, Crash Frequency Reductions – Horizontal Curve Segments and Exhibit 5-3, Crash Frequency Reductions – Corridor Segments. The following methodology was used in these calculations:

- It was not possible to analyze the crash reduction of flattening horizontal curves independently when they were closely spaced. These curves were grouped together into horizontal curve realignment areas.
- There were many vertical curves with deficient stopping sight distance (based on a 60 mph design speed) throughout the project corridor. The percentage of each segment length with deficient vertical curvature was estimated and used to calculate the benefit of flattening deficient vertical curves.
- The following countermeasures included the crash reduction of more than one countermeasure:
    - Widen shoulder width to 6 feet: Includes crash reduction of the safety edge.
    - Shoulder rumble strips: Includes crash reduction of widening shoulder widths to 6 feet.
    - Install Guardrail: Includes crash reduction of widening one shoulder width to 12 feet.
    - Modify vertical alignment: Includes the crash reduction of widening shoulders to 6 feet and of applying a safety edge.
    - Flattening horizontal curves: Includes the crash reduction of widening shoulders to 6 feet, safety edge, and proper superelevation rates.
- Any vertical alignment modification that fell within the limits of a horizontal curve realignment was attributed to flattening horizontal curves.

HSM Analysis results for the STH 65 & Kennedy Mill Avenue intersection are in Exhibit 6, STH 65 & Kennedy Mill Avenue

Economic Appraisal

An economic appraisal of each countermeasure was completed per HSM procedures to assess the viability of the countermeasure and prioritize the countermeasures that are viable. The economic appraisal focused on a 10 year service period from 2018 (design year) to 2028.

Crash Benefit

The crash reduction of each countermeasure was converted to a crash benefit – the monetary value assigned to a reduction in crashes. This is done by applying the societal crash costs in Table 7-1 of the HSM to the expected crash reduction. The average annual inflation rate between 2002 and 2012 was calculated using data from the Consumer Price Index. This rate was used to project 2018 societal crash costs from the 2005 societal crash costs in the HSM. The societal crash costs are below, listed as 2018 values (2005 values).

- Fatal/Injury (K+A+B) - $210,200 ($158,200)
- Possible Injury (C) - $59,700 ($44,900)
- PDO (O) - $9,800 (7,800)

The following factors were considered in the determination of societal crash costs:

- Societal crash costs from the National Safety Council (NSC), USDOT, and WisDOT HSIP project evaluation factor calculations were considered for use in this analysis. The WisDOT HSIP costs were quite a bit lower that the other three resources, and the HSM, NSC, and USDOT costs were all similar. The HSM societal crash costs were used to remain consistent with HSM methodology.
- A combined KAB cost was used in place of a separate cost for each severity. Fatal and high severity crashes often have similar crash characteristics and the differences are frequently arbitrary factors like age or seatbelt use. Using a combined KAB cost allows us to account for high severity crashes without skewing the data towards fatal crashes.

Countermeasure Implementation Cost

Unit costs for each countermeasure are in Table 4 below. Costs in this table reflect the cost to apply the given countermeasure independently and don't include incidental costs (earthwork, R/W, etc.) needed to implement the countermeasure. Countermeasure costs for pavement treatments that could be applied to new or existing pavements (centerline / edgeline rumble stripEs, safety edge, skid resistant pavement) are for implementation in conjunction with a pavement project; implementation of these countermeasures as a retrofit would be more expensive. Countermeasure costs are in 2012 dollars.

Countermeasure	Example	Cost	Source	Service Life
Centerline Rumble StripEs		$0.45 / ft	FHWA	20
Edgeline Rumble StripEs		$0.90 / ft	FHWA	20
Safety Edge		$0.41 / ft	FHWA	20
Update Signing to MUTCD Standards		$0.47 / ft	Recent previous project bid tabs	10
Shoulder Rumble Strips		$0.64 / ft centerline	New York State DOT	20

Chevrons		$565 / curve	FHWA	10
Speed Reducing Pavement Markings		$2260 / curve	FHWA	2
Solar Powered Flashing Beacon to Supplement Advance Curve Signing		$3500 /curve	Tapco	10
Guardrail		End area treatment (first 50 ft on both ends) - $250 ea $20 / ft	Recent previous project bid tabs	10
Skid Resistant Pavement Overlay (0.5 inches)		$0.25 / sq ft	Published references	5

Table 4, Countermeasure Unit Costs

Countermeasures that have combined crash reductions also have combined costs. See the *Expected Crash Reduction* section for a list of these countermeasures.

Plan & profile sheets were created to assess countermeasures that require reconstruction. These sheets include realignment of horizontal curves, realignment of vertical curves, and widening the existing shoulders. The purpose of this exercise was to provide costs for each individual vertical or horizontal realignment and segment-wide costs for widening shoulders. However, the majority of the project corridor was in a location of either a vertical or horizontal realignment and it was difficult to separate these realignments and find tie-in points to the existing alignment. As a result, a new vertical alignment was created for the entire project length, and divisions between horizontal and vertical realignment areas were approximated. Plan & Profile sheets for the corridor are in Exhibit 7, Proposed Plan and Profile. Also included in Exhibit 7 is a conceptual layout of the intersection modifications at the STH 65 & Kennedy Mill Avenue intersection. Cost Estimates for horizontal realignments, vertical realignments, shoulder widening, and intersection modifications are in Exhibit 8, Cost Estimates.

Benefit-Cost Analysis

A benefit-cost ratio (BCR) was calculated for each countermeasure applied to a corridor segment, horizontal curve, or group of horizontal curves. Curve groups are series of closely spaced curves that were combined for the application of specific countermeasures. Curve Groups are in Exhibit 2. The crash benefit for the BCR was calculated for a 10-year period (2018-2028) by converting the uniform annual benefit for the 10-year period to a 2018 value. The 2023 crash benefit was used as the uniform annual benefit to account for an increase in traffic volumes during the 10-year period. This 10-year crash benefit was converted to 2012 dollars using a 4% discount rate. A discount rate of 4% is used by the Highway Safety Information System, whose research is used by the FHWA. Countermeasure BCRs are in Exhibit 9-1, Benefit Cost Ratios – Corridor Segments, Exhibit 9-2, Benefit Cost Ratios - Horizontal Curve Segments, and Exhibit 9-3, Benefit Cost Ratios – Curve Groups.

Prioritize Projects

Countermeasures were filtered and prioritized using the Incremental BCR analysis procedures in HSM 8.2.1. This procedure involves completing a BCR analysis for each of the 182 potential safety improvements, removing any improvements with a BCR less than 1, and ranking the remaining improvements based on the ratio between the difference in crash benefit and the difference in cost. Of 183 potential safety improvements analyzed, 75 had a BCR of 1 or greater. A prioritized list of these countermeasures is in Exhibit 10, Prioritized Improvements.

Recommendations

This analysis has identified a series of safety improvements that are expected to provide the region the most safety benefit per dollar spent for the STH 65 corridor. We recommend projects be considered that implement the safety improvements listed in Exhibit 10. Our recommended corridor segment and horizontal curve locations for countermeasure implementation are in Table 5 below. The total costs in Exhibit 10 and Table 5 are not equal because Table 5 doesn't include Exhibit 10 countermeasures that are redundant or superseded by higher benefit countermeasures. Additional sources of differentiation between Exhibit 10 and Table 5 are asterisked in Table 5. A map showing the countermeasures to be considered for implementation on horizontal curves listed below in Table 5 is in Exhibit 11.

Corridor Segment			Horizontal Curve		
Corridor Segment Countermeasure	Locations for Implementation*	Cost	Horizontal Curve Countermeasure	Locations for Implementation*	Cost
Centerline Rumble StripEs**	All Segments***	$31,900	Chevrons	STA 40, 98, 111, 141, 149, 203, 218, 348, 670	$5,400
Edgeline Rumble StripEs**	All Segments	$63,800	Speed Reducing Pavement Markings	STA 40-50, 73, 98, 111, 136-149, 218, 268, 338-363, 670	$101,700
Safety Edge	All Segments***	$28,500	Solar Powered Flashing Beacon to Supplement Advance Curve Signing	STA 338-363	$7,000
Update Signing to MUTCD Standards	All Segments	$33,600	Guardrail	STA 40, 218	$75,300
Shoulder Rumble Strips	None	$0	Skid Resistant Pavement Overlay (0.5 inches)	STA 40, 45, 50, 73, 98, 111, 141, 149, 203, 218, 268, 348, 358, 363, 670	$69,700
Widen Shoulder Width to 6 feet	None	$0	Flatten Horizontal Curves	STA 692	$843,000
	Subtotal	$157,800		Subtotal	$1,102,100
				Total Cost	**$1,259,900**

* The intersection of STH 65 and CTH K and the 0.6 mile segment of STH 65 from 40th Avenue to the north (future HSIP project location) were excluded from the analysis.

** Installing edgeline rumble StripEs and centerline rumble stripEs will effectively narrow the travel lane by one foot to a 10 or 11 foot lane width. This would be problematic unless widening of the travel lanes occurred.

*** Centerline rumble stripEs and safety edge had a BCR less than 1 for segments 6 and 7. If centerline rumble stripes and safety edge will be installed along the rest of the corridor, the cost to install them in segments 6 and 7 will be minimal.

Table 5, Countermeasure Implementation Locations

The following factors were not fully reflected in the safety improvement ranking and should be given additional consideration:

- To discourage recreational drivers from "racing," improvements such as flattening horizontal and vertical curves and installing speed reducing pavement markings, centerline rumble stripes, and edgeline rumble StripEs or shoulder rumble strips may be more effective than the prioritized ranking shows.

- We expect that improving pavement condition has a safety benefit, but the data to support this is unreliable. Any safety benefit from resurfacing or reconstructing STH 65 is not included in this analysis.

These countermeasures would most likely be implemented in conjunction with a resurfacing project. To provide an estimate of the total cost of a resurfacing / safety countermeasure implementation project, cost estimates were developed for resurfacing STH 65 for the following alternatives:

- Alternative 1: Mill 2" from existing asphalt (24' width), remove existing coarse aggregate base course (CABC) shoulders (1' width) to 6" depth, place cold in-place recycled asphalt shoulders (1' width, 6" depth), and place 2" HMA pavement (26' width).

- Alternative 2: Mill 2" from existing asphalt (24' width) and replace with 2" HMA pavement.

Cost estimates excluded the area recently improved near the CTH K intersection, the future HSIP project north of 40th Avenue, and the recommended horizontal curve flattening near STA 692. The resurfacing cost estimates are in Exhibit 8 and the results are in Table 6.

Segment	Cost Estimate	
	Alternative 1	Alternative 2
1	$714,000	$667,000
2	$593,000	$553,000
3	$492,000	$460,000
4	$714,000	$667,000
5	$426,000	$399,000
6	$162,000	$151,000
7	$159,000	$147,000
8	$255,000	$240,000
9	$291,000	$271,000
Total	$3,806,000	$3,555,000

Table 6. Resurfacing Cost Estimates

Conclusions

The predictive safety analysis method in the HSM provides an effective quantitative method for prioritizing safety improvements. Application of this method to the STH 65 corridor has resulted in a list of prioritized safety improvements that allow the most effective use of road improvement funds. Not surprisingly, this analysis has shown that, with a few exceptions, improvements widely considered low-cost, high-benefit treatments are the most cost effective treatments for this corridor.

Exhibit 3-1

Descriptive Crash Statistics

2 DATE, TIME OF ACCIDENT, SEVERITY, # OF VEHICLES, MANNER OF COLLISION, ROAD SURFACE CONDITION, CITATION ISSUED 2

FAT = FATAL INJ = INJURY PD = PROPERTY DAMAGE

K = FATAL INJURY ANY INJURY RECEIVED IN A TRAFFIC ACCIDENT WHICH RESULTS IN DEATH WITHIN THIRTY (30) DAYS OF THE ACCIDENT.

A = INCAPACITATING INJURY ANY INJURY OTHER THAN A FATAL INJURY WHICH PREVENTS THE INJURED PERSON FROM WALKING, DRIVING, OR FROM PERFORMING OTHER ACTIVITIES WHICH HE/SHE PERFORMED BEFORE THE ACCIDENT.

B = NONINCAPACITATING INJURY ANY INJURY, OTHER THAN FATAL OR INCAPACITATING, WHICH IS EVIDENT AT THE SCENE. EVIDENCE OF INJURY MAY INCLUDE KNOWN SYMPTOMS OF AN INJURY WHICH ARE NOT DIRECTLY OBSERVABLE.

C = POSSIBLE INJURY ANY INJURY WHICH IS NOT OBSERVABLE OR EVIDENT AT THE SCENE BUT IS CLAMED BY THE INDIVIDUAL OR SUSPECTED BYTHE LAW ENFORCEMENT OFFICER.

ANGL = ANGLE
HEAD = HEAD ON COLLISION
H & R = HIT AND RUN
NO C = NO COLLISION WITH ANOTHER VEHICLE
REAR = REAR END
RTR = REAR TO REAR
SSO = SIDESWIPE OPPOSITE DIRECTION
SSS = SIDESWIPE SAME DIRECTION
UNKN = UNKNOWEN

STH 65 & Kennedy Mill Avenue

Worksheet 2A -- General Information and Input Data for Rural Two-Lane Two-Way Roadway Intersections

General Information		Location Information	
Analyst	JJS	Roadway	STH 65
Agency or Company	AECOM	Intersection	Kennedy Mill Avenue (existing)
Date Performed	11/07/12	Jurisdiction	WisDOT
Scenario	Intersection Conversion	Analysis Year	2023

Input Data				Base Conditions	Site Conditions			
Intersection type (3ST, 4ST, 4SG)				--	3ST			
$AADT_{major}$ (veh/day)	$AADT_{MAX}$ =	19,500	(veh/day)	--	1,600			
$AADT_{minor}$ (veh/day)	$AADT_{MAX}$ =	4,300	(veh/day)	--	400			
Intersection skew angle (degrees) [If 4ST, does skew differ for minor legs?]			No	0	Skew for Leg 1 (All):	0	Skew for Leg 2 (4ST only):	0
Number of signalized or uncontrolled approaches with a left-turn lane (0, 1, 2, 3, 4)				0	0			
Number of signalized or uncontrolled approaches with a right-turn lane (0, 1, 2, 3, 4)				0	0			
Intersection lighting (present/not present)				Not Present	Not Present			
Calibration Factor, C_i				1.00	1.00			

Worksheet 2B -- Crash Modification Factors for Rural Two-Lane Two-Way Roadway Intersections

(1) CMF for Intersection Skew Angle CMF_{1i} from Equations 10-22 or 10-23	(2) CMF for Left-Turn Lanes CMF_{2i} from Table 10-13	(3) CMF for Right-Turn Lanes CMF_{3i} from Table 10-14	(4) CMF for Lighting CMF_{4i} from Equation 10-24	(5) Combined CMF CMF_{COMB} (1)*(2)*(3)*(4)
1.00	1.00	1.00	1.00	1.00

Worksheet 2C -- Intersection Crashes for Rural Two-Lane Two-Way Roadway Intersections

(1) Crash Severity Level	(2) $N_{spf\ 3ST,\ 4ST\ or\ 4SG}$ from Equations 10-8, 10-9, or 10-10	(3) Overdispersion Parameter, k from Section 10.6.2	(4) Crash Severity Distribution from Table 10-5	(5) $N_{spf\ 3ST,\ 4ST\ or\ 4SG}$ by Severity Distribution $(2)_{TOTAL}$ * (4)	(6) Combined CMFs from (5) of Worksheet 2B	(7) Calibration Factor, C_i	(8) Predicted average crash frequency, $N_{predicted\ int}$ (5)*(6)*(7)
Total	0.334	0.54	1.000	0.334	1.00	1.00	0.334
Fatal and Injury (FI)	--	--	0.657	0.220	1.00	1.00	0.220
Property Damage Only (PDO)	--	--	0.343	0.115	1.00	1.00	0.115

Worksheet 2D -- Crashes by Severity Level and Collision Type for Rural Two-Lane Two-Way Road Intersections

(1) Collision Type	(2) Proportion of Collision Type(TOTAL) from Table 10-6	(3) $N_{predicted\ int\ (TOTAL)}$ (crashes/year) $(8)_{TOTAL}$ from Worksheet 2C	(4) Proportion of Collision Type(FI) from Table 10-6	(5) $N_{predicted\ int\ (FI)}$ (crashes/year) $(8)_{FI}$ from Worksheet 2C	(6) Proportion of Collision Type(PDO) from Table 10-6	(7) $N_{predicted\ int\ (PDO)}$ (crashes/year) $(8)_{PDO}$ from Worksheet 2C
Total	1.000	0.334	1.000	0.220	1.000	0.115
		(2)x(3)TOTAL		(4)x(5)FI		(6)x(7)PDO

Worksheet 2A -- General Information and Input Data for Rural Two-Lane Two-Way Roadway Intersections

General Information		Location Information	
Analyst	JJS	Roadway	STH 65
Agency or Company	AECOM	Intersection	Kennedy Mill Avenue
Date Performed	11/07/12	Jurisdiction	WisDOT
Scenario	Intersection Conversion	Analysis Year	2023

Input Data				Base Conditions	Site Conditions			
Intersection type (3ST, 4ST, 4SG)				--	3ST			
$AADT_{major}$ (veh/day)	$AADT_{MAX}$ =	19,500	(veh/day)	--	1,600			
$AADT_{minor}$ (veh/day)	$AADT_{MAX}$ =	4,300	(veh/day)	--	400			
Intersection skew angle (degrees) [If 4ST, does skew differ for minor legs?]			No	0	Skew for Leg 1 (All):	0	Skew for Leg 2 (4ST only):	0
Number of signalized or uncontrolled approaches with a left-turn lane (0, 1, 2, 3, 4)				0	0			
Number of signalized or uncontrolled approaches with a right-turn lane (0, 1, 2, 3, 4)				0	1			
Intersection lighting (present/not present)				Not Present	Not Present			
Calibration Factor, C_i				1.00	1.00			

Worksheet 2B -- Crash Modification Factors for Rural Two-Lane Two-Way Roadway Intersections

(1) CMF for Intersection Skew Angle CMF_{1i} from Equations 10-22 or 10-23	(2) CMF for Left-Turn Lanes CMF_{2i} from Table 10-13	(3) CMF for Right-Turn Lanes CMF_{3i} from Table 10-14	(4) CMF for Lighting CMF_{4i} from Equation 10-24	(5) Combined CMF CMF_{COMB} (1)*(2)*(3)*(4)
1.00	1.00	0.86	1.00	0.86

24	Segment 1 - Centerline Rumble Stripes	$ 5,700	62	STA 363 - Skid Resistant Pavement	$ 2,500
25	Segment 4 - Safety Edge	$ 5,100	63	STA 268 - Skid Resistant Pavement	$ 6,200
26	STA 136 - STA 149 - Speed Reducing Pavement Markings	$ 11,300	64	STA 73 - Skid Resistant Pavement	$ 4,600
27	Segment 2 - Safety Edge	$ 4,300	65	STA 358 - Skid Resistant Pavement	$ 8,800
28	Segment 4 - Centerline Rumble Stripes	$ 5,700	66	STA 45 - Skid Resistant Pavement	$ 5,000
29	Segment 6 - Update Signing to MUTCD Standards	$ 1,200	67	STA 98 - Chevrons	$ 600
30	STA 670 - Skid Resistant Pavement	$ 2,200	68	STA 338 - STA 363 - Flashing Beacon	$ 7,000
31	Segment 5 - Safety Edge	$ 3,200	69	STA 268 - Speed Reducing Pavement Markings	$ 11,300
32	STA 218 - Skid Resistant Pavement	$ 2,900	70	STA 203 - Skid Resistant Pavement	$ 4,500
33	STA 40 - Skid Resistant Pavement	$ 2,700	71	STA 111 - Chevrons	$ 600
34	STA 348 - Skid Resistant Pavement	$ 5,400	72	STA 141 - Chevrons	$ 600
35	STA 670 - Speed Reducing Pavement Markings	$ 11,300	73	STA 149 - Chevrons	$ 600
36	STA 218 - Speed Reducing Pavement Markings	$ 11,300	74	STA 203 - Chevrons	$ 600
37	Segment 2 - Centerline Rumble Stripes	$ 4,800	75	STA 73 - Speed Reducing Pavement Markings	$ 11,300
38	STA 149 - Skid Resistant Pavement	$ 6,000		**TOTAL COST**	**$ 1,544,400**

Notes: 1. Installing edgeline rumble StripEs and centerline rumble stripEs will effectively narrow the travel lane by one foot to a 10 or 11 foot width. This would be problematic unless widening of the travel lanes occurred.

2. The intersection of STH 65 and CTH K and the 0.6 mile segment of STH 65 from 40th Avenue to the north (future HSIP project location) were excluded from the analysis.

STA # REPRESENTS THE PI OF A HORIZONTAL CURVE

NOTES:

1. THE FOLLOWING COUNTERMEASURES ARE RECOMMENDED FOR IMPLEMENTATION IN ALL SEGMENTS:
   *CENTERLINE RUMBLE STRIPES
   *EDGELINE RUMBLE STRIPES,
   *SAFETY EDGE
   *UPDATING SIGNING TO MUTCD STANDARDS
2. THE INTERSECTION OF STH 65 AND CTH K AND THE 0.6 MILE SEGMENT OF STH 65 FROM 40TH AVENUE TO THE NORTH (FUTURE HSIP PROJECT LOCATION) WERE EXCLUDED FROM THE ANALYSIS.
3. INSTALLING EDGELINE RUMBLE STRIPES AND CENTERLINE RUMBLE STRIPES WILL EFFECTIVELY NARROW THE TRAVEL LANE BY ONE FOOT TO A 10 OR 11 FOOT WIDTH. THIS WOULD BE PROBLEMATIC UNLESS WIDENING OF THE TRAVEL LANES OCCURRED.
