1.0 EXECUTIVE SUMMARY

Himalayan Consultants, LLC (Himalayan) was contracted by Milwaukee County Department of Transportation (MCDOT) to perform a Phase 1 Hazardous Materials Assessment (HMA) for the proposed improvements of replacement of traffic signal equipment at six intersections along W. Good Hope Road (CTH PP) from N. 51st Street to N. Range Line Road, W. Green Tree Road intersection with N. Port Washington Road, and W. Bradley Road intersection N. Sherman Boulevard (43rd Street) within the Village of Brown Deer, City of Glendale, and City of Milwaukee, in Milwaukee County, Wisconsin (hereafter referred to as the project corridor).

Based on the proposed improvements, work will be limited to the intersections and no pavement will be replaced but curb ramps and sidewalk within 50 feet of the corners may be affected. The intersections along the project corridor with proposed improvements are:

- W. Good Hope Road intersection with N. 51st Street
- W. Good Hope Road intersection with N. 43rd Street
- W. Good Hope Road intersection with N. Teutonia Avenue
- W. Good Hope Road intersection with N. Range Line Road
- W. Green Tree Road intersection with N. Port Washington Road
- W. Bradley Road intersection N. Sherman Boulevard (43rd Street)

Under the proposed improvements, cuts of up to 14 feet are anticipated and no right-of-way is anticipated for this project.

The purpose of this Phase 1 HMA was to identify sites with potential hazardous materials that may be present within or immediately adjacent to the proposed improvements limits of the project corridor and recommend, if considered necessary, a list of sites for additional hazardous material investigation. These identified sites may have hazardous materials impacts that could potentially be displaced and require additional management, during the proposed improvement activities.

A summary of the findings of this HMA include:

- Based on the record search and field reconnaissance, thirteen potentially hazardous materials sites (Sites #1 through #13) were identified within the project corridor (see Table 3). Considering the potential for construction activities to encounter contaminated materials (i.e. excavations >2 feet bgs and distance) and no potential R/W acquisitions, Himalayan recommends that additional HMI [FDM Procedures 21-35-10 or 21-35-12] be conducted for Sites #1, #4, #5, #7, #8, #9, #11, and #12.

- The Phase 2.0 and 2.5 hazardous materials investigations for Site #1, #4, #5, #7, #8, #9, #11 and #12 should consist of at least two soil borings located in the areas of excavation proposed adjacent to these sites, including laboratory analysis of two or more discrete soil samples from

each boring, and collection / laboratory analysis of a composite sample from the site to characterize the soils for potential disposal and/or treatment at a licensed landfill facility. Depending on project excavation requirements, the borings should be advanced to the maximum depths of excavation anticipated for the proposed improvements and/or the anticipated depth of soil/groundwater impacts. In addition to soil sampling, the Phase 2.0 and 2.5 investigations for these sites should also include at least one groundwater sample from temporary wells installed at each of the sites, if groundwater is encountered in the borings. This should provide characterization for potential disposal options, if dewatering is needed in excavations adjacent to the sites. These investigations should be performed prior to the planned improvements, to address any special provisions possibly needed for handling impacted soil and/or groundwater displaced during construction activities.

- The need for special provisions (STSP 107/100), related to potential hazardous material concerns associated with Site #10 should be included in the let contract to properly address and manage these concerns if they are encountered during construction in this area. These provisions can be re-assessed once additional design information is available or additional investigation activities are completed. All activities should be completed in accordance with local, state, and federal regulations.

2.0 PROJECT CORRIDOR INFORMATION

2.1 Introduction

This report presents the results of a Phase 1 Hazardous Materials Assessment (HMA) performed for the proposed improvements along W. Good Hope Road (CTH PP) from N. 51st Street to N. Range Line Road, W. Green Tree Road intersection with N. Port Washington Road, and W. Bradley Road intersection N. Sherman Boulevard (43rd Street) within the Village of Brown Deer, City of Glendale, and City of Milwaukee, in Milwaukee County, Wisconsin (hereafter referred to as the project corridor). Under the proposed improvements, work will be limited to the intersections and no pavement will be replaced but curb ramps and sidewalk within 50 feet of the corners may be affected. The intersections along the project corridor with proposed improvements are:

- W. Good Hope Road intersection with N. 51st Street
- W. Good Hope Road intersection with N. 43rd Street
- W. Good Hope Road intersection with N. Teutonia Avenue
- W. Good Hope Road intersection with N. Range Line Road
- W. Green Tree Road intersection with N. Port Washington Road
- W. Bradley Road intersection N. Sherman Boulevard (43rd Street)

Refer to Figure 1-1 in Appendix A for the general location and an overview of the project corridor.

2.2 Purpose and Scope

The purpose of this Phase 1 HMA is to identify sites with potential hazardous materials that may be present within or immediately adjacent to the proposed improvement limits of the project corridor and to recommend a list of sites, if considered necessary, for additional hazardous materials investigation. These identified sites may have hazardous materials impacts that could potentially be displaced and require management, during the proposed improvement activities.

The HMA was performed in general accordance with the Wisconsin Department of Transportation (WisDOT) Facilities Development Manual (FDM) Procedure 21-35-5 (revised December 22, 2011) and included a review of state and federal United States Environmental Protection Agency (U.S. EPA) databases and preliminary project construction information, and a field reconnaissance of the project corridor in order to identify the sites / parcels with potential hazardous materials concerns.

2.3 Methodology

Several sources were reviewed for information, including regulatory agency listings, historical land use records, and aerial photographs, which would indicate the potential use/handling/storage of hazardous materials or the generation of hazardous wastes. If such information was found, the parcel was noted as a potential hazardous material site and/or parcel that may require further hazardous materials investigation (see Table 3). To assist in determining the locations where additional investigation may be appropriate, the identified parcels were further screened with respect to three additional criteria:

- The potential that the parcel could be acquired for 'right-of-way';
- The potential that construction activities (i.e. excavation > 2 feet below grade or proximity to impacted soil/groundwater) could encounter contaminated materials, and;
- The potential for contamination on the subject parcel to migrate and adversely affect either right-of-way parcels or other parcels that may be disturbed during construction.

2.4 Project Description

Based on the preliminary project information provided by MCDOT, the design plans, work will be limited to the intersections and no pavement will be replaced but curb ramps and sidewalk within 50 feet of the corners may be affected. The six intersections with proposed improvements are W. Good Hope Road with N. 51st Street, N. 43rd Street, N. Teutonia Avenue, and N. Range Line Road, W. Green Tree Road with N. Port Washington Road, and W. Bradley Road with N. Sherman Boulevard (43rd Street).

Under the proposed improvements, work will be limited to the intersection corners where cuts of up to 14 feet are anticipated for traffic signals and no pavement will be replaced except for curb ramps and sidewalk within 50 feet of the corners. Right-of-way acquisition is not anticipated for this project. Land use throughout the project corridor is generally a mix of residential, commercial, parks, and institutional.

2.5 Responsible Unit of Government

Milwaukee County and WisDOT are the unit of government responsible for the project. The project corridor is located within the Village of Brown Deer, City of Glendale, and City of Milwaukee, in Milwaukee County, Wisconsin.

2.6 Historical Land Use

2.6.1 Aerial Photographs

Himalayan reviewed historical aerial photographs of the project corridor for the years 1937, 1951, 1963, 1967, 1970, 1975, 1980, 1985, 1990, 1995, 2000, 2005, 2010, 2015, 2018, and 2020 (see Appendix P). The aerial photographs were obtained from Milwaukee County Internet Mapping Site [Ref. 1]. Based on the scale and general nature of these historical photographs, only the razing of structures and other major development or construction activities within the project area could be confirmed. The following is a brief summary of historical land use in the project corridor, based on Himalayan's review of these photographs.

2.6.1.1 N. Sherman Blvd. / W. Bradley Rd. Intersection

Table 1: Summary of Aerial Photographs
Phase 1 Hazardous Materials Assessment
N. Sherman Blvd. / W. Bradley Rd.
Milwaukee County, Wisconsin
Project ID: 2967-00-07

Year	Description
1937	The intersecting roadways within the project corridor (W. Bradley Road and N. Sherman Boulevard) appear to be two-lanes. The predominant land use along the project corridor is vacant / grassland.
1951	Commercial buildings have been constructed in the northeast corner [Site #1] and the southeast corner of the intersection. No other significant changes were observed along the project corridor.
1956	No significant changes were observed along the project corridor.
1963	The commercial building in the southeast corner of the intersection has been razed and redeveloped with a commercial building and parking lot. A large commercial building and parking lot has also been developed in the southwest corner of the intersection. No other significant changes were observed along the project corridor.
1967	The building in the northeast corner of the intersection has been razed and replaced with a new commercial building. It appears N. Sherman Boulevard has been redeveloped with multilane road with grassed medium and is present in its current configuration. W. Bradley Road appears to have been widened and intersecting a newly developed roadway (N. Teutonia Avenue) east of the project corridor. No other significant changes were observed along the project corridor.
1970	No significant changes were observed along the project corridor.
1975	No significant changes were observed along the project corridor.
1980	No significant changes were observed along the project corridor.
1985	No significant changes were observed along the project corridor.

1990	It appears W. Bradley Road has been redeveloped with multilane road with a medium and is present in its current configuration. Sidewalks have also been developed along W. Bradley Road and N. Sherman Boulevard. No other significant changes were observed along the project corridor.
1995	No significant changes were observed along the project corridor.
2000	No significant changes were observed along the project corridor.
2005	No significant changes were observed along the project corridor.
2007	The commercial building in the southeast corner has been razed. No other significant changes were observed along the project corridor.
2010	The larger commercial building and parking lot in the southwest corner has been razed and redeveloped with two commercial buildings. A commercial building and an apartment building complex has also been constructed in the southeast corner of the intersection. No other significant changes were observed along the project corridor.
2015	An apartment building has been developed in the southwest corner of the intersection. No other significant changes were observed along the project corridor.
2020	It appears W. Bradley Road and N. Sherman Boulevard has been resurfaced. A roundabout has also been developed east of the project corridor (W. Bradley Road and N. Teutonia Avenue intersection) No other significant changes were observed along the project corridor.

2.6.1.2 W. Good Hope Rd. / N. 51st St., N. 43rd St., N. Teutonia Ave., & N. Range Line Rd.

Table 1: Summary of Aerial Photographs Phase 1 Hazardous Materials Assessment W. Good Hope Road (CTH PP) / N. 51st St/N. 43rd St/ N. Teutonia Ave./ N. Range Line Rd. Milwaukee County, Wisconsin Project ID: 2967-00-07	
Year	Description
1937	The roadways within the project corridor (W. Good Hope Road, Street, N. 43rd Street, N. Teuonia Avenue, and N. Range Line Road) appear to be two-lanes. Land use along the project corridor is predominantly commercial, residential and golf courses.
1951	No significant changes were observed along the project corridor.
1956	No significant changes were observed along the project corridor.
1963	N. 51st Street has been developed and is present in its current configuration. It appears commercial buildings are present in the corner intersections of W. Good Hope Road with N. 51st Street, N. 43rd Street and N. Teutonia Avenue. No other significant changes were observed along the project corridor.
1967	No significant changes were observed along the project corridor.

1970	It appears the W. Good Hope Road roadway from N. 43rd Street to N. Range Line Road and N. Teutonia Avenue roadway has been redeveloped with multilane road. N. Teutonia Avenue appears to present in its current configuration.
1975	It appears W. Good Hope Road roadway from N. 43rd Street to N 51st Street has been redeveloped with multilane road with a medium and is present with its current configuration. No other significant changes were observed along the project corridor.
1980	No significant changes were observed along the project corridor.
1985	No significant changes were observed along the project corridor.
1990	No significant changes were observed along the project corridor.
1995	No significant changes were observed along the project corridor.
2000	It appears the N. 43rd Street roadway has been redeveloped with multilane road and is present in its current configuration. No other significant changes were observed along the project corridor.
2005	No significant changes were observed along the project corridor.
2010	No significant changes were observed along the project corridor.
2015	No significant changes were observed along the project corridor.
2020	No significant changes were observed along the project corridor.

2.6.1.3 N. Port Washington Rd. / W. Green Tree Rd. Intersection

Table 1: Summary of Aerial Photographs Phase 1 Hazardous Materials Assessment N. Port Washington Rd. /W. Green Tree Rd. Milwaukee County, Wisconsin Project ID: 2967-00-07	
Year	Description
1937	The two intersecting roadways (W. Green Tree Road and N. Port Washington Road) within the project corridor appear to be two-lanes. The northeast [Site #11], southwest [Site #12], and southeast [Site #13] corner of the intersection appears to be occupied by buildings. The northwest corner [Site #10] of the intersection is occupied by woodland.
1951	The trees in the northwest corner of the intersection [Site #10] has been razed and replaced with a gas station. Some of the buildings in the southwest corner have been razed [Site #12]. The commercial building in the southeast corner has been razed and redeveloped into a new commercial building [Site #13]
1956	No significant changes were observed along the project corridor.
1963	Buildings in the southwest corner of the intersection has been razed to a vacant lot [Site #12]. The buildings in the northeast corner of the intersection has been razed and replaced with a commercial building [Site #11]

1967	No significant changes were observed along the project corridor.
1970	A large parking lot has been constructed in the southwest corner [Site #12] of the intersection. It appears W Green Tree Road has been widened and is present in its current configuration. No other significant changes were observed along the project corridor.
1975	The commercial building in the northwest corner [Site #10] of the intersection has been razed. No other significant changes were observed along the project corridor.
1980	A commercial building has been constructed in the northwest corner [Site #10] of the intersection. No other significant changes were observed along the project corridor.
1990	The commercial building in the northwest corner of the intersection has been razed and redeveloped with a new commercial building [Site #11].
1995	The building in the southeast corner of the intersection has been razed [Site #12]. No other significant changes were observed along the project corridor.
2000	A commercial building has been developed in the southeast corner of the intersection [Site #12]. No other significant changes were observed along the project corridor.
2005	The parking lot in the southwest corner of the intersection has been razed [Site #12]. No other significant changes were observed along the project corridor.
2010	Most of the buildings in the southwest corner of the intersection has been razed and replaced with a several commercial buildings and a large parking lot [Site #12]. No other significant changes were observed along the project corridor.
2015	The commercial building in the northwest corner of the intersection has been razed and redeveloped with a new commercial building [Site #10]. No significant changes were observed along the project corridor.
2020	A large commercial building has been constructed northwest of the intersection. No other significant changes were observed along the project corridor.

2.6.2 Topographic Map

Himalayan reviewed United States Geological Survey (USGS) topographic maps of the project corridor for the years 1892, 1901, 1906, 1958, 1971, 1976, and 2013 (see Appendix P). The topographic maps were obtained from EDR [Ref. 2]. The earliest maps, between 1892 and 1906, depict intersecting roadways within the project corridors (W. Good Hope Road with N. 43rd Street, N. Teutonia Avenue, and N. Range Line Road, N. Port Washington Road with W. Green Tree Road, and N. Sherman Boulevard with N. Bradley Road) are present. The map dated 1958 depict N. 51st Street present and intersecting W. Good Hope Road. In the next series of maps, dated 1971 through 2013 denotes W. Good Hope Road, N. 43rd Street/N. Sherman Boulevard, and N. Port Washington as secondary highways and N. 51st Street, N. Range Line Road, and W, Green Tree Road as local connectors with all roadways present in their current configuration. Most of the project corridor is located within a predominantly 'urbanized area' and the closest waterways are Brown Deer Creek, between N. Teutonia Avenue and N. Range Line Road and the Milwaukee

River, between N. Range Line Road and N. Port Washington Road. Refer to Appendix P for EDR's Historical Topo Map Report.

2.6.3 Sanborn Maps

Based on the EDR report, no Sanborn Map coverage was available for the project corridors [Ref. 3]. The EDR Certified Sanborn Map Report is attached in Appendix P.

2.6.4 WisDOT Historical Plan Sets

No historical plan sets or as-builts of the project corridor were provided to Himalayan for review.

2.7 Surficial Hydrogeology

According to the USGS topographic map, the average ground surface elevation along the project corridor varies from approximately 693 to 710 feet above mean sea level (MSL) [Ref. 2]. The highest elevations occur near N. Range Line Road, while the lowest elevations occur near N. Sherman Boulevard. Surface water runoff for the entire length of the project corridor appears to collect in storm sewer catch basins located along the curb and gutter. Storm sewer lines most likely drain south toward the Milwaukee River that eventually outfalls into the Lake Michigan.

Himalayan obtained information on the subsurface conditions along the project corridor from the United States Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Web Soil Survey of Milwaukee and Waukesha Counties, Wisconsin [Ref. 4]. Based on the USDA NRCS soil survey report, soils along the project corridor consist clayey land (Cv), Mequon silt loam (MtA), and Kewaunee silt loam (KnB). Cv is generally described as areas where development activities have either covered over or removed the original solum of the soil, therefore, native soil conditions are no longer present within the project corridor. This soil type is described as moderately well drained and the depth to groundwater is generally about 12 to 80 inches bgs. MtA KnB are described as somewhat poorly drained to well drained and underlain by silty clay loam. Depth of water table is generally 12 to 80 inches bgs. [Ref. 4]. Local groundwater flow direction along the project corridor is estimated to be generally east for intersections at N. 51st Street, N. 43rd Street, and Sherman Blvd. towards Brown Deer Creek that eventually outfalls into the Milwaukee River. The estimated local groundwater flow direction is estimated to be east for N. Range Line Road intersection and west at N. Port Washington Road towards the Milwaukee River. Regional groundwater flow for all intersections is generally to the east towards Lake Michigan. The Milwaukee County Interactive Mapping System also denotes that project corridor is outside the FEMA Flood Hazard Area designated as 'Floodway' and the '1% Chance Flood Area' or 100-year flood area [Ref. 1].

2.8 Record Search

Himalayan retained EDR to conduct a search of state and federal databases within ¼-mile of the project corridor [Ref. 5]. The records review consisted of identifying potential hazardous materials sites within ¼-mile of the project corridor, in accordance with FDM Procedure 21-35-5. Refer to Appendix O for a summary of findings from the EDR database search. Additionally, Himalayan conducted online database searches of the following Wisconsin Department of Natural Resources (WDNR), Wisconsin Department of Agriculture, Trade and Consumer Protection (WDATCP), and U.S. EPA programs to cross-reference and supplement the EDR database search results [Ref. 6 to 11]:

- The WDNR's Contaminated Lands Environmental Action Network (CLEAN) on-line database "BRRTS on the Web" and web based mapping system "RR Sites Map" (provides information on contaminated sites in the WDNR system) (see Appendix O);
- WDATCP Storage Tank Database (provides information on registered USTs and ASTs);
- WDNR Solid and Hazardous Waste Information System (SHWIMS) (provides access to information on sites, and facilities operating at sites, that are regulated by the WDNR Waste Management program);
- The WDNR Historic Registry of Waste Disposal Sites (provides waste management information for sites prior to 1999); and
- U.S. EPA Envirofacts Multisystem Search (searches multiple environmental databases for facility information, including toxic chemical releases, water discharge permit compliance, hazardous waste handling processes, Superfund status, and air emission estimates).

Table 2 presents the list of several potential hazardous materials sites identified by EDR, within the search distance (¼-mile) of the project corridor:

W. Bradley Road and N. Sherman Boulevard (43rd Street)

Based on the EDR database review, the following sites were identified within 200 feet of the intersection at W. Bradley Road and N. Sherman Boulevard (43rd Street).

- Farkas Automotive Services, 8008 N. Sherman Boulevard (Potential Concern – RCRA-CESQG, SHWIMS, LUST, UST, FINDS, EDR Historic Auto) [Site #1]

Refer to site-specific appendices (Appendix B) for additional information regarding this site.

The following additional site was also identified within 200 feet of the W. Bradley Road Street project corridor. However, based on the proposed improvements for this section of the project corridor (limited to the intersections and within 50 feet of corners), this site is not considered to pose a hazardous materials concern during the proposed construction activities along the project corridor.

- Federal Distributing Company, 4059 W. Bradley Road, UST, LUST, CRS, AUL, WI WRRSER)

W. Good Hope Road and N. 51st Street

Based on the EDR database review, the following site was identified within 200 feet of the intersection at W. Good Hope Road and N. 51st Street.

- Gail Business Forms, Inc., 7215 N. 51st Street (5100 W. Good Hope Rd.) (Potential Concerns – UST, LUST, SHWIMS, RCRA-VSQG) [Site #2]
- Tripoli Country Club, 5032 W. Good Hope Road (Potential Concern – UST, SWHIMS, RCRA-VSQG)[Site #3]

Refer to site-specific appendices (Appendix C, D) for additional information regarding this site

W. Good Hope Road and N. 43rd Street

Based on the EDR database review, the following sites were identified within 200 feet of the intersection at W. Good Hope Road and N. 43rd Street

- Former Jones Mobil Station #05, 4230 W. Good Hope Road (Potential Concerns – AST, UST, LUST, EDR Historical Auto, SHWIMS, RCRA NonGen, FINDS) [Site #4]
- Phil Tolkan Leasing, 4301 W. Good Hope Road (Potential Concern – UST, LUST, EDR Historical Auto, SHWIMS, RCRA NonGen, FINDS) [Site #5]
- Former Petro Pantry, 4225 W. Good Hope Road (7168 N. 43rd Street) (Potential Concern – UST, LUST, EDR Historical Auto, SHWIMS, RCRA NonGen, WI WRRSER, FINDS, AST) [Site #6]

Refer to site-specific appendices (Appendix E, F, G) for additional information regarding this site.

The following additional site was also identified within 200 feet of the N. 43rd Street project corridor. However, based on the proposed improvements for this section of the project corridor (limited to the intersections and within 50 feet of corners), this sits is not considered to pose a hazardous materials concern during the proposed construction activities along the project corridor.

- Nostalgia Supper Club (Former), 7155 N. 43rd Street (Potential Concerns – ERP)

W. Good Hope Road and N. Teutonia Avenue

Based on the EDR database review, the following sites were identified within 200 feet of the intersection at W. Good Hope Road and N. Teutonia Avenue.

- Former Gasoline / Auto Service Station (Currently Subway), 7213 N. Teutonia Avenue (Potential Concerns – EDR Historical Auto) [Site #7]
- Former Heiser Leasing, 7220-7222 N. Teutonia Avenue (Potential Concerns – UST, LUST, SHWIMS, RCRA-VSQG, WI ERP, SPILLS, CRS, AUL, EDR Historical Auto) [Site #8]
- Former Dry Cleaners (Currently Walgreens) 7181 N. Teutonia Avenue (Potential Concerns – EDR Historical Dry Cleaners, SHWIMS, MANIFEST, RCRA-VSQG, FINDS) [Site #9]

Refer to site-specific appendices (Appendix H, I, J) for additional information regarding this site.

The following additional site was also identified within 200 feet of the N. Teutonia Avenue project corridor. However, based on the proposed improvements for this section of the project corridor (limited to the intersections and within 50 feet of corners), this sits is not considered to pose a hazardous materials concern during the proposed construction activities along the project corridor.

- ELCO Truck Rentals, 3514 W. Good Hope Road (Potential Concerns –UST, LUST, CRS, AUL WI WRRSER)

W. Good Hope Road and N. Range Line Road

Based on the EDR database review, the following site was identified within 200 feet of the intersection at W. Good Hope Road and N. Range Line Road However, based on the proposed improvements for this section of the project corridor (limited to the intersections and within 50 feet of corners), this site is not considered to pose a hazardous materials concern during the proposed construction activities along the project corridor.

- Clemens Prange Residence, 2606 W. Good Hope Road (Potential Concerns – SWHIMS, LUST, RCRA NonGen / NLR, FINDS)
- DCi Marking, Inc., 2727 W. Good Hope Road (Potential Concerns – RCRA-VSQG, SHWIMS, FINDS, MANIFEST)

W. Green Tree Road and N. Port Washington Road

- Former Service Station (Currently PNC Bank), 7001 - 7005 N. Port Washington Road, (Potential Concerns – EDR Historical Auto, UST, LUST, CRS, AUL) [Site #10]
- Amoco Station #2290, 7010 N. Port Washington Road (Potential Concerns – EDR Historical Auto, RCRA-VSQG, UST, LUST, CRS, AUL, SPILLS, WI WRRSER, SHWIMS) [Site #11]
- Former Wilson & Allen Property, 6980 N Port Washington Road (Potential Concerns – UST, LUST, SHWIMS, RCRA-VSQG, FINDS) [Site #12]
- Pick'n Save, Retail Stores & Restaurants (Former Shore Health & Rehab Center) 6969 N Port Washington Road, (Potential Concerns – RACRA-VSQG, FINDS, UST, WI ERP, SWHIMS, LUST, SPILLS) [Site #13]

Refer to site-specific appendices (Appendix K, L, M, N) for additional information regarding this site.

2.9 Interviews

Himalayan submitted a records request to Ms. Sue Williams of the City of Milwaukee Fire Department Administration Division (phone: 414-286-8948). Ms. Williams explained that the Fire Department only maintains records for the past 10 to 15 years. Ms. William's review of department records noted responses for natural gas leaks at several properties within the project corridor. However, she did not identify any fire calls, chemical / petroleum spills or hazardous material clean-ups associated with accidents at the intersections within the project corridor over the past 10 years.

2.10 Field Reconnaissance

On January 6th, 2021 Himalayan performed a reconnaissance of the project corridor to identify the sites and/or parcels with potential hazardous materials concerns. Land surface observations were made by walking and driving along the roadway. In general, visual observations were made for the possible presence of potential contaminant indicators (such as mounded soils, odors, stressed vegetation, marked and unmarked bulk containers, vent pipes, etc.) to identify potential hazardous materials concerns within the project corridor. Land use along the project corridor appeared to be mainly a mixture of golf courses, restaurants, retail sales, and general commercial.

Approximately 6 inches of snow covered some exterior ground surfaces not used for driving. No other access limitations or vision barriers were present during the site reconnaissance. No sites with potential hazardous materials concerns were identified within the project corridor during the field reconnaissance. No obvious contaminant indicators, such as unmarked bulk containers, debris piles, or fill dirt were observed at or immediately adjacent to the project corridor during field reconnaissance.

3.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the record search and field reconnaissance, thirteen potentially hazardous materials sites (Sites #1 through #13) were identified within 200 feet of the project corridor (see Table 3)

However, considering the potential for construction activities to encounter contaminated materials (e.g. excavations > 2 feet bgs, distance) and no potential R/W acquisitions is anticipated, Himalayan concluded that further hazardous materials site investigations were necessary for only Sites #1, #4, #5, #7, #8, #9, #11 and #12.

Himalayan concluded that no hazardous materials site assessments were necessary for Sites #10. However, Himalayan recommends a "Notice to Contractor" statement be included in the special provisions of the let contract indicating that potential hazardous material concerns associated with these sites may need to be addressed and properly managed if they are encountered during construction in this area.

A discussion of the hazardous material concerns associated with each of these sites and how they relate to the proposed construction requirements for the project corridor, including the hazardous materials site assessment site summary for each site, is presented in Appendices B to N. Additionally, pertinent excerpts (relevant figures, data, text, photographs, and correspondence) are included in the respective appendices for the sites, where applicable.

Table 3 presents a summary of site names and addresses, potential contaminants of concern, construction requirements, and real estate interests adjacent to the three sites identified, and recommendations based on the potential presence and type of contamination:

[1] Sites may be listed in one or more databases

- The Phase 2.0 and 2.5 hazardous materials investigations for Sites #1, #4, #5, #7, #8, #9, #11 and #12 should consist of at least two soil borings located in the areas of excavation proposed adjacent to these sites, including laboratory analysis of two or more discrete soil samples from each boring, and collection / laboratory analysis of a composite sample from the site to characterize the soils for potential disposal and/or treatment at a licensed landfill facility. Depending on project excavation requirements, the borings should be advanced to the maximum depths of excavation anticipated for the proposed improvements and/or the anticipated depth of soil/groundwater impacts. In addition to soil sampling, the Phase 2.0 and 2.5 investigations for these sites should also include at least one groundwater sample from temporary wells installed at each of the sites, if groundwater is encountered in the borings. This should provide characterization for potential disposal options, if dewatering is needed in excavations adjacent to the sites. These investigations should be performed prior to the planned improvements, to address any special provisions possibly needed for handling impacted soil and/or groundwater displaced during construction activities.

- The need for special provisions (STSP 107/100), related to potential hazardous material concerns associated with Site #10 should be included in the let contract to properly address and manage these concerns if they are encountered during construction in this area. The provisions for all identified sites should be re-assessed once additional design information is available or additional investigation activities are completed. All activities should be completed in accordance with local, state, and federal regulations

LIMITATIONS

Himalayan prepared this report for MCDOT, Milwaukee County, and WisDOT's use as part of the environmental evaluation of the properties in the project corridor that most likely would have the potential for causing hazardous materials impact(s) to the proposed improvements. It was prepared in accordance with the currently accepted environmental and engineering practices. Because the evaluation is based solely on site visits, interviews, and review of available data from various regulatory agencies, unknown hazardous materials locations may be present in the project corridor that could not be identified within the scope of the investigation or that were not apparent at the time of report preparation. **The conclusions and recommendations contained in this report represent our professional opinions based on the project construction information available at the time of this report.** No warranty or guarantee is expressed or implied regarding the findings of this assessment.

This is a technical report and is not a legal representation or interpretation of environmental laws, rules, regulations, or policies of local, state, or federal governmental agencies. This report is based, in part, on unverified information supplied to Himalayan from several sources during the project research; therefore, Himalayan does not guarantee its completeness or accuracy.

No investigation is thorough enough to exclude the presence of hazardous substances at a given site. If hazardous substances or hazardous conditions have not been identified during the assessment, such a finding should not therefore be construed as a guarantee of the absence of such substances or conditions, but rather as the result of the services performed within the scope, limitations, and cost of the work performed.

Highway/Street: W. Good Hope Road (CTH PP)
Termini/Limits: 51st St -Range Line Rd./N. Sherman Blvd./W. Green Tree Road
County: Milwaukee County

Property Information:
Site Name(s):Farkas Automotive Services [Site #1]
DOT parcel number (if known):
Property Address: 8008 N. Sherman Blvd.
Owner's Name: ROETHEL ENTERPRISES, LLC
Owner's Address:
Owner's Phone:
Current Land Use: Autoshop
Past Land Use: Commercial

Real Estate Requirements:
☒None ☐Total take ☐Strip acquisition of feet
☐Temporary Limited Easement (TLE)
☐Permanent Limited Easement (PLE)
☐ Other (describe)

Construction Requirements:
☒ Excavation within current right of way to 14 feet
☐ Excavation within proposed right of way to feet
☐ Excavation within easement to feet
☐ Public or private utility or sanitary or storm sewer installation or excavation to feet

Information from database searches and interviews:
Department of Safety and Professional Services (DSPS)
- ☒ site has registered tanks ☐ASTs ☒USTs
- ☐ tanks are currently in use
- ☒ tanks are abandoned date: 1991,1995
- Tank contents:
  - ☐ Leaded gasoline ☒ Unleaded gasoline ☒ Fuel Oil ☐ Diesel
  - ☐ Kerosene ☐ Unknown ☒ Other (Waste/Used motor oil)
- ☐ site is a DSPS administered LUST site; DCOMM ID number:
- ☐ site is a closed DSPS LUST site; closure date:

Department of Natural Resources (DNR)
- ☒ site is a DNR administered LUST site; BRRTS number: 03-41-003641
- ☐ site is a DNR administered ERP site; BRRTS number:
- ☒ site is a closed ☒LUST ☐ERP site; closure date: Oct. 1996
- ☐ site is a landfill
- ☐ site is an abandoned waste disposal site
- ☐ site is a hazardous waste generator
- ☐ Other (please describe)

Sanborn Maps: site is on mapsdated . Comments:
WisDOT historic plan sets: site is a on project dated . Comments:
Business directories: site is in the directory dated Comments:

A check in a checkbox indicates a positive or "yes" response.

Aerial photos: Site has been occupied by the current commercial building since the 1970s.
☐ Contamination discovered at feet during utility or other excavation in the area. Indicate location on site map.
Interview Information or other comments:

Visual Evidence of Potential Contamination: (include additional information in space provided)
☒ No evidence of tanks
☐ USTs ☐ASTs Location, number and condition of tanks, contents, comments:
Location in relationship to current right of way: ☐ map attached
Location in relationship to proposed right of way: ☐ map attached
☐Drums ☐Stained soils ☐Odor ☐Sheen on surface water ☐Areas of excavation
☐ Areas of fill ☐Stressed vegetation ☐ Pond(s) ☐ Basins/sumps ☐ Monitoring wells
☐ Soil borings
Comments:

Potential for Contaminant Migration: (attach supporting documentation such as plume maps, summaries of site investigation or closure reports).
☒ Property is a potential source of contamination
☐ Adjacent property is a potential source of contamination. Include site name or BRRTS number if known, describe location, include contaminant type and any additional information.
☐ Contaminated soil known to be within proposed right of way from feet to feet below ground surface
☐ Contaminated groundwater known to be within proposed right of way at feet below ground surface.
☒ Contaminated soil or groundwater within existing right of way. Attach copy of most recent investigation and plume maps.

Attachments – required
☒ Site photographs and a site map showing areas of concern
☐ Plat map showing parcel and any proposed areas of acquisition or easement
☐ Historic aerial photos of site - clearly outline site
☐ Historic WisDOT or other as-builts and plat maps - clearly outline site
☐ Plume maps for known contamination. Indicate existing or proposed right of way where applicable.

Recommendations
☐ No additional hazardous materials investigation is required.
☐ If construction or real estate requirements change, evaluation of need for further investigation will be necessary.
☐ Information is sufficient to use Standard Special Provisions. Copy of completed Standard Special Provision is attached.
☒ Conduct additional investigation
- ☐ Phase 2 (determine if contamination is present)
- ☒ Phase 2.5 (determine extent of contamination within existing R/W only)
- ☐ Phase 3 (determine full extent of contamination prior to acquisition)
- ☐ Phase 4 (remediate site)
- ☐ Other (describe)

A check in a checkbox indicates a positive or “yes” response

Site #1
Farkas Automotive Services
8008 N. Sherman Blvd.
N. Sherman Blvd: STA 53+60 to 54+95 RT

The site is identified on the RCRA-CESQG, SHWIMS, LUST (BRRTS #03-41-003641), UST, FINDS, and EDR Historic Auto databases. Based on field reconnaissance, the site is currently occupied by an auto service / repair shop called Farkas Automotive. Review of the Milwaukee County Automated Mapping and Land Information System online indicated that the site is owned by Frank M. Farkas Revocable Trust [Ref. 1].

According to the WDATCP Storage Tank Database, two 6,000-gallon and one 4,000-gallon unleaded gasoline, and one 300-gallon and one 1,000-gallon fuel oil UST, and one 400-gallon used oil UST are registered for the site [Ref. 2]. All of the USTs were closed / removed from the site between September 1991 and August 1995.

According to the EDR report, no Sanborn Map coverage is available for the project corridor.

Several plastic and metal, unmarked 55-gallon drums were observed near the northeast exterior of the building, during Himalayan's inspection of the site on December 5, 2016. The drums did not appear to be leaking and were in fair condition. Drum contents are unknown.

BRRTS #03-41-003641: Based on a Soil Remediation by Overexcavation Report and Closure Request prepared by Sigma Environmental Services, Inc. (Sigma), the site was previously utilized as a gasoline service station and auto maintenance garage since the early 1960's. The Sigma Report indicates that gasoline service was discontinued in the early 1990's and the WDNR was notified of obvious soil contamination at the site in 1993[Ref. 3, 4].

Between September 1994 and January 1995, twenty four soil borings (GP-1 to GP-13, SB-1 to SB-6, and B-1 to B-5) were advanced at the site and adjacent property (Milwaukee County Property) at depths from 15 to 20 feet bgs. Five borings were converted to groundwater monitoring wells (MW-1 to MW-5). Soil and groundwater samples were analyzed for GRO, VOCs, and/or lead. Sigma concluded that soil impacts appear to have originated primarily in the vicinity of the former gasoline tanks and dispensers located on the western half of the site. In August 1995, the remaining UST systems were removed and over 7,494 tons of impacted soil was over-excavated and transported off-site to a sanitary landfill. Excavation depths ranged from 11 to 16 feet bgs and no groundwater was encountered during excavation activities. Prior to backfilling with clean material, thirty four confirmation soil samples (S1 to S34) were collected from the sidewalls and bottom of the gasoline UST area on the west side of the building and six soil samples (FOS1 to FOS6) were collected from the fuel oil UST area on the east side of the building. The confirmation samples were analyzed for DRO, GRO, VOCs, and/or total lead.

Following several rounds of groundwater sampling in 1996, the activity was conditionally closed by WDNR in October 1996 [Ref. 5]. The site is listed on the GIS Registry with a deed restriction for groundwater use and a barrier maintenance plan for residual soil contamination underneath the southeast corner of the existing building.

A limited Phase 2.5 HMI was performed at the site by Himalayan, in July 2017. Based on the investigation results, Himalayan concluded that residual soil and groundwater impacts remain along the south side of the site and recommended that a "Notice to Contractor" should be included in the special provisions of the let contract indicating the possibility of encountering contaminated groundwater adjacent to the site.

Geology / Hydrogeology

According to the Sigma reports, soils at the site generally consist of low permeable silty clays to at least 20 feet bgs [Ref. 3, 4]. An 18 inch layer of fine to medium silty sand at 13 feet bgs (B-4/MW-4) and several small sand seams were encountered in various borings. Sigma noted that these layers and several utility corridors extending through the site are possible contaminant migration pathways.

Groundwater was encountered at approximately 7 to 10 feet bgs and the flow direction was estimated to be south-southwest, trending towards the intersection of Sherman Boulevard and W. Bradley Road. Sigma noted that groundwater depths were fairly consistent throughout the year and the hydraulic gradient was "relatively flat".

Soil Impacts

According to the Sigma reports, soil analytical results indicated that several confirmation samples contained GRO (5.0 to 55 mg/kg), DRO (12 to 1,490 mg/kg), benzene (7.3 to 244 µg/kg), 1 ,2-dichloroethane (7.1 to 100 µg/kg), ethylbenzene (147 to 174 µg/kg), toluene (1.5 to 35 µg/kg), xylenes (1.4 to 51 µg/kg), naphthalene (4.6 to 1,450 µg/kg), trimethylbenzenes (14 to 765 µg/kg), and/or lead (5.9 to 20.3 mg/kg) in soil samples collected at 6 to 16 feet bgs [Ref. 4].

Concentrations of DRO (1,490 mg/kg) in one sample [FOS1 at 6 feet bgs]; benzene (7.3 to 244 µg/kg) in five samples at 15 to 16 feet bgs [S10, S13, S14, S18, S23] and in one sample at 7 feet bgs [S24]; 1 ,2-dichloroethane (7.1 to 100 µg/kg) in four samples at 15 to 16 feet bgs [S4, S5, S10, S23] exceeded their respective NR 720 RCLs.

According to Himalayan's report, no VOCs were detected within the W. Bradley Road R/W. However, several RCRA metals (barium, cadmium, chromium, mercury, and silver) were detected but all concentrations were below their respective statewide BTV and/or NR 720 RCLs [Ref. 5].

It appears that residual soil contamination at the site (in S6 and S24) is directly adjacent to the current Sherman Boulevard and W. Bradley Road R/Ws, but does not appear to extend underneath the roadway.

Groundwater Impacts

Based on laboratory analytical results from the last round of groundwater monitoring conducted at the site in August 1996, the following contaminants were detected: benzene (1.2 µg/L) and MBTE (2.9 to 9.9 µg/L) [Ref. 3]

The concentration of benzene in MW-4 (1.2 µg/L) exceeded the NR 140 PAL for the protection of groundwater quality.

According to Himalayan's groundwater sampling event in July 2017, toluene (0.30 J µg/L) in FK-2 was the only VOC detected within the W. Bradley Road R/W. However, several RCRA metals including lead (6.8 µg/L in FK-2) and selenium (21.1 J µg/L in FK-1 and 35.8 µg/L in FK-2) were at concentrations exceeding their respective NR 140 PAL [Ref. 5].

It appears that groundwater impacts exceeding the NR 140 PAL are within the current W. Bradley Road R/W, and the groundwater flow direction (southwest) indicates that the contaminant plume may extend into the current R/W.

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site.

Recommendations

Considering that residual soil contamination at the site exists within the current Sherman Boulevard and W. Bradley Road R/W (7 feet bgs) and groundwater impacts were identified directly adjacent to the W. Bradley Road R/W, this site has the potential to impact some proposed improvements. Therefore, further investigation is recommended for the site.

The need for further investigation should be re-evaluated once construction and/or real estate requirements have been determined.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

1.0 EXECUTIVE SUMMARY

Himalayan Consultants, LLC (Himalayan) was contracted by Milwaukee County Department of Transportation (MCDOT) to perform a Phase 2.5 Hazardous Materials Investigation (HMI) for the parcel of land at 8008 N. Sherman Blvd., in the Village of Brown Deer, Milwaukee County, Wisconsin (hereafter referred to as the Property).

The Phase 2.5 HMI is proposed for the Property as part of the reconstruction activities along N. Teutonia Avenue between W. Good Hope Road and slightly north of W. Bradley Road. Depth of cut at the Property is expected to be greater than two feet below ground surface (bgs) during the proposed improvements.

Based on a Phase 1 Hazardous Materials Assessment (HMA) conducted by Himalayan in 2017, petroleum released from six former UST systems at the Property has impacted soil and groundwater conditions in the local area. Considering that residual soil contamination at the Property exists within the current Sherman Boulevard and W. Bradley Road R/W (7 feet bgs) and groundwater impacts were identified directly adjacent to the W. Bradley Road R/W, this Property has the potential to impact some proposed improvements.

1.1 SUMMARY OF FINDINGS

Results of the Phase 2.5 HMI conducted by Himalayan at the Property are summarized in the following paragraphs.

- Based on field observations and soil boring activities, the shallow subsurface soils at the Property consist primarily of asphalt / concrete pavement with base course from the ground surface to a depth of approximately 1 foot bgs, underlain by unconsolidated clay fill to depths ranging from 5 to 6 feet bgs. No ‘non-exempt solid wastes’ (e.g. industrial fill materials such as slag, cinders, foundry sand, etc.) were encountered in the fill materials. Native silty clay and silty sand were encountered beneath the fill materials to a depth of approximately 15 feet bgs

- Saturated soil conditions were encountered at approximately 5 to 10 feet bgs during drilling, and groundwater levels ranged from 5 to 6 feet during sample collection activities.

- No obvious odors or staining were noted, and no PID readings greater than 0.0 parts per million (ppm) were detected in the soil samples collected during boring activities at the Property.

- No VOCs were detected in any of the soil samples submitted for laboratory analyses. .

- Five RCRA metals (barium, cadmium, chromium, mercury, and silver) were detected in the soil samples. However, all samples were at concentrations below their respective statewide background threshold value (BTV) and/or NR 720 RCLs.

- Toluene (0.30 J µg/L) was identified in the groundwater sample collected from FK-2. This Toluene concentration is below NR 140 PAL and NR 140 ES for the protection of groundwater quality.

- Six RCRA metals (arsenic, barium, chromium, selenium, silver, and/or lead) were identified in the groundwater samples collected from FK-1 and FK-2. Lead (6.8 µg/L in FK-2) and selenium (21.1 J µg/L in FK-1 and 35.8 µg/L in FK-2) were identified at concentrations above their respective NR 140 PALs, but below their NR 140 ESs.

- Laboratory analyses results from the composite sample collected from soil borings at the Property indicate that low level petroleum impacts are present, but all constituents are within landfill acceptance criteria.

1.2 CONCLUSIONS AND RECOMMENDATIONS

- No significant soil impacts were identified at the Property. Low level groundwater impacts were identified along the south side of the Property.

- A "Notice to Contractor" should be included in the special provisions of the let contract indicating the possibility of encountering contaminated groundwater adjacent to the Property. Any de-watering activities performed along the south side of the Property, during the proposed improvements, may need to be managed appropriately (e.g. discharge to sanitary sewer).

- Based on the results of Himalayan's Phase 2.5 HMI, evidence of a low level hazardous waste release was identified within the right of way adjacent to the Property. The contaminants of concern are most likely associated with the 'conditionally closed' LUST site at the Property.

- Based on the groundwater depth (> 8 feet bgs) and low level impacts encountered along the south side of the Property, the contamination should not pose a significant concern to the proposed reconstruction activities. Therefore, Himalayan concludes that no further investigation is considered necessary for the Property.

2.0 INTRODUCTION

Himalayan Consultants, LLC (Himalayan) was contracted by Wisconsin Department of Transportation (WisDOT) to perform a Phase 2.5 Hazardous Materials Investigation (HMI) for the parcel of land at 8008 N. Sherman Blvd., in the Village of Brown Deer, Milwaukee County, Wisconsin (hereafter referred to as the Property).

The Phase 2.5 HMI is proposed for the Property as part of the reconstruction activities along N. Teutonia Avenue between W. Good Hope Road and slightly north of W. Bradley Road. Depth of cut at the Property is expected to be greater than two feet below ground surface (bgs) during the proposed improvements.

Based on a Phase 1 Hazardous Materials Assessment (HMA) conducted by Himalayan in 2017, petroleum released from six former UST systems at the Property has impacted soil and groundwater conditions in the local area. Considering that residual soil contamination at the Property exists within the current Sherman Boulevard and W. Bradley Road R/W (7 feet bgs) and groundwater impacts were identified directly adjacent to the W. Bradley Road R/W, this Property has the potential to impact some proposed improvements.

3.0 PURPOSE AND SCOPE

The purpose of this Phase 2.5 HMI was to identify the potential presence and nature of contamination in the proposed area of reconstruction at the Property.

The Phase 2.5 HMI was performed in general accordance with FDM Procedures 21-35-10 and 21-35-30 [Ref. 2], and the current Wisconsin Department of Natural Resources (WDNR) rules and regulations.

4.0 PROPERTY DESCRIPTION

4.1 PROPERTY LOCATION

The Property is located at at 8008 N. Sherman Blvd., in the Village of Brown Deer, Milwaukee County, Wisconsin (see Figure 1-1, Appendix A). The Property is further described as being part of the southwest ¼ of the southwest ¼ of Section 12, Township 8 North, Range 21 East, in the Town of Somers, Wisconsin. The Property encompasses approximately 4.5 acres and is situated to the southeast of the intersection of N. Teutonia Avenue (CTH D) and W. Bradley Road.

4.2 SURFACE CONDITIONS

Based on Himalayan's visual inspection of the Property on December 5, 2016, the Property has a commercial building with concrete pavement extending to the sidewalks along W. Bradley Road

and Sherman Boulevard. No obvious contaminant indicators, such as vent pipes, stressed vegetation, staining, debris piles, or fill dirt were observed at the Property. However, the Property is historically utilized as an auto service station and several plastic and metal, unmarked 55-gallon drums were observed near the northeast exterior of the building.

4.3 PROPERTY HISTORY

Based on a Phase 1 ESA conducted by Himalayan in 2016, the Property has been previously utilized as a gasoline service station and auto maintenance garage since the early 1960's [Ref. 1]. All of the USTs were closed / removed from the Property between September 1991 and August 1995. Investigation / remediation activities associated with soil and groundwater contamination were conducted, and the activity was conditionally closed by the WDNR in October 1996. The Property is listed on the GIS Registry with a deed restriction for groundwater use and a barrier maintenance plan for residual soil contamination underneath the southeast corner of the existing building.

5.0 SOILS AND GROUNDWATER CHARACTERIZATION

On July 27, 2017, Horizon Construction and Exploration, LLC, under contract with Himalayan, advanced two direct push Geoprobe® soil borings (FK-1 and FK-2) at the Property (see Figure 2-1, Appendix A). The borings were advanced in close proximity to areas previously identified with contamination. Both borings were converted to temporary groundwater monitoring wells, in an attempt to evaluate groundwater quality at the Property.

The weather conditions were sunny with a light wind and an outdoor air temperature of approximately 70° F at the time of field activities.

5.1 SOIL SAMPLING AND SCREENING PROCEDURES

Continuous soil samples were obtained from each boring at intervals of approximately 5-feet. The soil samples collected from each boring were examined by Himalayan to evaluate soil type, color, odor, texture, moisture, and other characteristics of the soil using visual-manual procedures, including identification of any non-native soils (fill materials) encountered. These observations were used to prepare descriptive geologic logs for each boring and visually classify the soils according to the Unified Soil Classification System (USCS), in general accordance with American Society for Testing and Materials (ASTM) International Procedure D-2488. A field log of each boring was prepared, including observations for the depth of groundwater if encountered, and is included in Appendix C.

Soil samples were screened in the field for volatile organic vapors using a Photoionization Detector (PID) equipped with a 10.6 eV lamp (MiniRAE 2000). The PID was calibrated on-site using a standard of 100 ppm isobutylene gas and manufacturer recommended calibration procedures. Refer

to Appendix B for detailed descriptions of drilling, soil sampling, and field screening procedures. Refer to Table 1 for field screening results.

Based on field observations, two soil samples from each boring were collected and submitted for laboratory analyses. One soil sample, with the highest potential for impacts (e.g. obvious odor/staining or possible fill material), was collected from within the unsaturated (vadose) zone. A second soil sample was collected from the saturated / vadose zone interface, based on field observations.
Each soil sample collected for laboratory analyses was placed in laboratory supplied containers, stored on ice in a cooler, and submitted with a chain of custody to CT Laboratories, LLC (CTL) (WDNR Certified Laboratory # 157066030).

The selected soil samples were laboratory analyzed for volatile organic compounds (VOCs), and RCRA Metals. A trip blank was provided by Pace, stored and transported with the soil samples, and laboratory analyzed for VOCs, to provide quality assurance / quality control (QA/QC) data.

One composite sample was also analyzed for reactive cyanide, reactive sulfide, flashpoint, free liquids, TCLP Metals, PCBs, TCLP VOCs, DRO, GRO, and TCLP Semi-Volatiles (Protocol B) to supplement waste characterization for potential disposal/and or treatment of contaminated soils during construction. These parameters are considered sufficient to provide waste characterization for the disposal and/or treatment of contaminated soils at landfills operated by Veolia Environmental Services and Waste Management.

Refer to Appendix C for Sampling Methodology and Investigation Procedures.

5.2 GROUNDWATER SAMPLING PROCEDURES

Temporary monitoring wells were constructed of 1-inch polyvinyl chloride (PVC) pipe with a 5-foot slotted / screen section at the bottom and solid pipe to the surface, in compliance with WDNR construction guidelines for temporary groundwater monitoring wells [Ref. 3].

Himalayan performed groundwater sampling on temporary wells FK-1 and FK-2. Groundwater extraction was performed with a peristaltic pump. The peristaltic pump was connected to dedicated PVC tubing (polyethylene and medical grade silicone) that was inserted inside the well casing. Adequate groundwater was collected from all temporary wells, to prepare and submit samples for VOCs and RCRA metal analysis.
Groundwater samples were prepared in the field, which included preservation/storage in laboratory supplied containers, storage in a cooler (on-ice), and submittal with a chain-of-custody to CTL for laboratory analyses.

All boreholes / wells were backfilled with bentonite chips after completion of sampling, in accordance with Wis. Adm. Code NR 141 [Ref. 4]. The Borehole Abandonment Forms for each borehole / well are presented in Appendix C.

6.0 SUBSURFACE CONDITIONS

6.1 SOIL CHARACTERIZATION

Based on field observations and soil boring activities, the shallow subsurface soils at the Property consist primarily of unconsolidated clay fill to depths ranging from 5 to 6 feet in both borings. Fill materials were generally underlain by native silty clay and silty sand to the terminal depths of 15 feet. A sand and gravel seam from 11 to 12 feet bgs was encountered in boring FK-2. No non-exempt solid wastes, per NR 500.08, (e.g. industrial fill materials such as slag, cinders, foundry sand, etc.) were encountered during the soil boring activities [Ref. 5].

Refer to the Soil Boring Logs in Appendix C for a detailed description of soils encountered at each boring location.

Continuous soil samples were obtained from each boring and were field screened for the presence of VOCs. No VOCs were detected in any of the soil samples. No obvious odor or soil staining was observed in any of the sample intervals. Field screening results are summarized in Table 1.

Table 1: Field Screening Results

7/27/2017	2 - 4	0.0	0.0
7/27/2017	4 - 6	0.0	0.0
7/27/2017	6 - 8	0.0	0.0
7/27/2017	8 - 10	0.0	0.0
7/27/2017	10 - 12	0.0	0.0
7/27/2017	12 - 14	0.0	0.0
7/27/2017	14 - 15	0.0	0.0

Notes:
ppm = parts per million
PID calibrated on-site using a standard of 100 ppm of isobutylene gas.
A background PID reading of 0.0 ppm was noted during field activities.

6.2 GROUNDWATER CONDITIONS

Saturated soil conditions were encountered at approximately 11 feet bgs in the two borings during drilling. Upon completion of drilling, groundwater was at 11 feet bgs in FK-1 and 8 feet bgs in FK-2. Groundwater depths may vary based on seasonal and temporal variations in precipitation, infiltration, and surface water runoff.

7.0 ANALYTICAL RESULTS

7.1 SOIL SAMPLES

A total of four soil samples were collected at depths ranging from 4 to 12 feet bgs, and submitted for laboratory analyses of VOCs and RCRA metals. No VOCs were detected in the soil samples.

Five RCRA metals (barium, cadmium, chromium, mercury, and silver) were detected in the soil samples. Barium (32.2 to 77.4 mg/kg) was identified in all samples, with no concentrations above the NR 720 RCLs. Cadmium (0.054 J to 0.18 mg/kg) was identified in all samples collected, with no concentrations above the NR 720 RCLs. Total chromium (8.9 to 14.1 mg/kg) was identified in all samples at concentrations below the statewide BTV. Mercury (0.0075 to 0.01 mg/kg) was identified in samples FK-1 at 10 to 12 feet bgs and FK-2 between 6 to 12 feet bgs, at concentrations below the NR 720 RCLs. Silver (0.44 J to 0.68 J mg/kg) was identified in all samples collected, with no concentrations above the NR 720 RCLs.

Table 2 presents a summary of soil quality results. Refer to Figure 2-1, Appendix A, for additional details on boring locations and analytical results, and Appendix D for the complete laboratory analytical reports.

VOCs = Volatile Organic Compounds; RCRA = Resource Conservation and Recovery Act
mg/kg = milligrams per kilogram = parts per million (ppm)
µg/kg = micrograms per kilogram = parts per billion (ppb)
ND = Not Detected; NSE = No Standard Established; TCLP = Toxicity Characteristic Leaching Procedure
RCL= Residual Contaminant Level ; BTV = Background Threshold Levels
J = Estimated concentration above the MDL and below the adjusted reporting limit
Results in **RED** exceed NR 720 Direct Contact - Industrial Standards
Results in **BOLD** exceed NR 720 Direct Contact - Non-Industrial Standards
Results in ***ITALICS*** exceed NR 720 Groundwater Protection RCLs
[1]Total chromium RCL if no Cr-VI

7.2 GROUNDWATER SAMPLES

Two groundwater samples, collected from temporary wells FK-1 and FK-2, were submitted for laboratory analysis of VOCs and RCRA metals. One petroleum VOC was detected. Toluene (0.30 J µg/L) was identified in FK-2. The toluene concentration is below NR 140 PAL and NR 140 ES for the protection of groundwater quality. A "J" designation also indicates an estimated concentration identified between the limit of detection and limit of quantitation.

Six RCRA metals (arsenic, barium, chromium, selenium, silver, and lead) were detected in the groundwater samples. Lead (6.8 µg/L in FK-2) and selenium (21.1 J µg/L in FK-1 and 35.8 µg/L in FK-2) were identified at concentrations above their respective NR 140 PALs, but below their NR 140 ESs.

Table 3 presents a summary of groundwater quality results. See Figure 3-2 in Appendix A for additional details on temporary well locations and groundwater analytical results. The complete laboratory analytical reports are included in Appendix D.

Table 3: Groundwater Quality Results
Phase 2.5 Hazardous Materials Investigation
Farkas Automotive Services [Site #1]
8008 N. Sherman Blvd., Milwaukee County
Project ID: WH020191

Sample ID	FK-1	FK-2	NR 140 ES (µg/L)	NR 140 PAL (µg/L)

Silver	2.6 J	< 2.5	50	10

Notes:
Analytes identified above the limit of detection (LOD) in at least one sample are included in Table
Bold value exceeds NR 140 ES; *Italics* value exceeds NR 140 PAL
RCRA = Resource Conservation and Recovery Act; µg/L = micrograms per liter = parts per billion (ppb)
ND = Not Detected; NSE = No Standard Established; ES = Enforcement Standard; PAL = Preventive Action Limit
J = Estimated concentration at or above the adjusted limit of detection and below the adjusted limit of quantitation
< = Concentration less than the indicated test method

7.3 WASTE CHARACTERIZATION SAMPLE

A composite soil sample (FK-COMP) was compiled from the Property to satisfy the landfill acceptance criteria and to provide waste characterization for potential off-site disposal and/or treatment of contaminated soils at landfills operated by Advanced Disposal Services and Waste Management.

Laboratory analytical results of general chemistry for the sample included: flashpoint >140º F and no free liquids. Table 4 presents the summary of soil quality results for the composite sample. See Attachment D for the complete laboratory report.

Table 4: Laboratory Analytical Results - Protocol B

7.4 INVESTIGATIVE DERIVED WASTE

Most of the soil and water obtained during collection activities was placed within the laboratory sample containers submitted to CTI. No obvious odor, soil staining, or sheen was observed and no elevated PID readings were encountered in any of the soil or groundwater samples during field investigation. Therefore, the minimal amount of investigative derived waste (IDW) consisting of excess soil cuttings generated from drilling/sampling activities at the Property were evenly spread out in the grassy areas.

8.0 SUMMARY OF FINDINGS

- Based on field observations and soil boring activities, the shallow subsurface soils at the Property consist primarily of asphalt / concrete pavement with base course from the ground surface to a depth of approximately 1 foot bgs, underlain by unconsolidated clay fill to depths ranging from 5 to 6 feet bgs. No 'non-exempt solid wastes' (e.g. industrial fill materials such as slag, cinders, foundry sand, etc.) were encountered in the fill materials. Native silty clay and silty sand were encountered beneath the fill materials to a depth of approximately 15 feet bgs

- Saturated soil conditions were encountered at approximately 5 to 10 feet bgs during drilling, and groundwater levels ranged from 5 to 6 feet during sample collection activities.

- No obvious odors or staining were noted, and no PID readings greater than 0.0 parts per million (ppm) were detected in the soil samples collected during boring activities at the Property.

- No VOCs were detected in any of the soil samples submitted for laboratory analyses. .

- Five RCRA metals (barium, cadmium, chromium, mercury, and silver) were detected in the soil samples. However, all samples were at concentrations below their respective statewide background threshold value (BTV) and/or NR 720 RCLs.

- Toluene (0.30 J µg/L) was identified in the groundwater sample collected from FK-2. This Toluene concentration is below NR 140 PAL and NR 140 ES for the protection of groundwater quality.

- Six RCRA metals (arsenic, barium, chromium, selenium, silver, and/or lead) were identified in the groundwater samples collected from FK-1 and FK-2. Lead (6.8 µg/L in FK-2) and selenium (21.1 J µg/L in FK-1 and 35.8 µg/L in FK-2) were identified at concentrations above their respective NR 140 PALs, but below their NR 140 ESs.

- Laboratory analyses results from the composite sample collected from soil borings at the Property indicate that low level petroleum impacts are present, but all constituents are within landfill acceptance criteria.

9.0 CONCLUSIONS AND RECOMMENDATIONS

- No significant soil impacts were identified at the Property. Low level groundwater impacts were identified along the south side of the Property.

- A “Notice to Contractor” should be included in the special provisions of the let contract indicating the possibility of encountering contaminated groundwater adjacent to the Property. Any de-watering activities performed along the south side of the Property, during the proposed improvements, may need to be managed appropriately (e.g. discharge to sanitary sewer).

- Based on the results of Himalayan’s Phase 2.5 HMI, evidence of a low level hazardous waste release was identified within the right of way adjacent to the Property. The contaminants of concern are most likely associated with the ‘conditionally closed’ LUST site at the Property.

- Based on groundwater depth (> 8 feet bgs) and the low level impacts encountered along the south side of the Property, residual contamination should not pose a significant concern to the proposed reconstruction activities. Therefore, Himalayan concludes that no further investigation is considered necessary for the Property.

10.0 LIMITATIONS

Himalayan prepared this report for MCDOT's use as part of the environmental evaluation of the above Property. It was prepared in accordance with currently accepted environmental and engineering practices. The evaluation is based on subsurface physical and chemical data obtained from soil borings at specific locations, times, and depths sampled; therefore, additional unidentified environmental impacts may be present at the Property that could not be identified within the scope of the investigation or that were not apparent at the time of report preparation. The conclusions and recommendations contained in this report represent our professional opinions. No warranty or guarantee is expressed or implied regarding the findings of this investigation.

This report has been prepared for the exclusive use of MCDOT for specific application to the project as described in the report. There are no beneficiaries of this report other than MCDOT, and no other person or entity is entitled to rely upon this report without the written consent of Himalayan and a written agreement limiting Himalayan's liability.

Himalayan is not responsible for any claims, damages, or liabilities associated with the interpretation of these findings or reuse of the analysis, associated site data, or recommendations without the express written authorization of Himalayan.

Limitations of this assessment may not be altered or waived without written consent of Himalayan. This is a technical report and is not a legal representation or interpretation of environmental laws, rules, regulations, or policies of local, state, or federal governmental agencies. This report is based, in part, on unverified information supplied to Himalayan from several sources during the project research; therefore, Himalayan does not guarantee its completeness or accuracy.

Himalayan assumes no responsibility for conditions we are not authorized to investigate or conditions not generally recognized as environmentally unacceptable when services were performed. Due to the potentially great economic risk associated with ownership of contaminated property, Himalayan recommends that MCDOT retain legal counsel to evaluate issues of liability.

No investigation is thorough enough to exclude the presence of hazardous substances at a given site. If hazardous substances or hazardous conditions have not been identified during the assessment, such a finding should not therefore be construed as a guarantee of the absence of such substances or conditions, but rather as the result of the services performed within the scope, limitations, and cost of the work performed.

APPENDIX B

SAMPLING METHODOLOGY AND INVESTIGATION PROCEDURES

1. Drilling and Collection of Soil Samples

Geoprobe®: Subsurface soil samples were collected using a Geoprobe®. The Geoprobe® utilizes a hydraulic ram device that forces a 5-foot long, 2.38-inch inside diameter (ID), stainless steel rod into the ground. Each rod was fitted with a removable 1.70-inch ID clear acetate tube liner. Following extraction from the ground, the liners were removed from the stainless steel rod and the interior soil column was separated into approximately 2-foot intervals and inspected.

2. Decontamination Procedures

All downhole boring and sampling equipment was decontaminated before use and between the borings and sampling events. The split barrel sampler was decontaminated by the drilling subcontractor personnel between samples by scrubbing off soil particles with a brush and water in a bucket with an Alconox® solution and then rinsing the sampler in a separate bucket of clean water.

3. Field-Screening of Soil Samples

A portion of each sample was field-screened for the presence of Volatile Range Organics (VOC) using a PID (MiniRAE 2000) equipped with a 10.6 eV lamp. Field screening of soil samples consisted of filling a quart size Ziploc® bag one third to half full with soil and then sealing the bag securely to prevent the escape of any potential VOC. The potential VOC concentration in the bag headspace was measured by gently opening the seal with the tip of the PID probe followed by firmly pressing the bag around the probe and recording the highest PID response. A background measurement of ambient VOC was also made immediately prior to each sample screening and recorded on the PID forms. The PID was field calibrated at the beginning using a standard of 100 parts per million (ppm)-isobutylene gas and with the manufacturer-recommended calibration procedures.

4. Collection/ Laboratory Analysis of Soil Samples

In addition to the soil used for PID testing, a separate portion of each sample was preserved for possible laboratory analyses. These samples were preserved by placing the soil in a labeled Ziploc® bag and then placing the bag into a cooler with ice (if required). Two samples from each of the borings were selected for laboratory analyses. A methanol trip blank was collected to provide quality assurance/quality control (QA/QC) data and laboratory-analyzed for VOC. The methanol trip blank accompanied the other samples until delivery to the laboratory to check for any potential cross-contamination of the samples during handling and transportation to the laboratory. The soil samples were collected in the laboratory provided jars as required by WDNR guidance documents. All samples were stored in a cooler with ice and maintained at a temperature of approximately 4^0 C until delivered under chain of custody procedures to laboratory personnel.

The analytical methods used were: WDNR Modified DRO Method for DRO, WDNR Modified GRO Method for GRO, EPA Method 8260B for VOCs, EPA Methods 245.5 for Mercury, and 6010B for Arsenic, Barium, Cadmium, Chromium, Lead, Selenium and Silver.

5. Well Installation Procedures

The temporary wells were constructed of 1-inch polyvinyl chloride (PVC) pipe with 5-foot slotted screen sections from the bottom to the surface, which complies with general WDNR construction guidelines.

6. Borehole Abandonment Procedures

After completion of the soil and , attempt to, groundwater sample each boring/well was backfilled to or near the ground surface with bentonite in general accordance with Chapter NR 141 of the Wisconsin Administrative Code.

Liner(s) Removed?	☒ Yes	☐ No	☐ Not Applicable
Screen Removed?	☐ Yes	☐ No	☒ Not Applicable
Casing Left in Place?	☐ Yes	☒ No	
Was casing Cut Off Below Surface?	☐ Yes	☒ No	
Did Sealing Material Rise to Surface?	☒ Yes	☐ No	
Did Material Settle After 24 Hours?	☐ Yes	☒ No	
If Yes, Was Hole Retopped?	☐ Yes	☐ No	

Required Method of Placing Sealing Material
☐ Conductor Pipe-Gravity ☐ Conductor Pipe-Pumped
☐ Screened & Poured (Bentonite Chips) ☒ Other (Explain) Gravity

Sealing Materials
☐ Neat Cement Grout
☐ Sand-Cement (Concrete) Grout
☐ Concrete
☐ Clay-Sand Slurry (11 lb./gal. wt.)
☐ Bentonite-Sand Slurry " "
☐ Bentonite Chips

For monitoring wells and monitoring well boreholes only
☒ Bentonite Pellets
☐ Granular Bentonite
☐ Bentonite-Cement Grout
☐ Bentonite - Sand Slurry

(5) Material Used To Fill Well/Drillhole	From (Ft.)	To (Ft.)	No. Yards, Sacks Sealant or Volume	Mix Ratio or Mud Weight
3/8" Chipped Bentonite	Surface	15	5 lbs	

(6) Comments _____

(7) Name of Person or Firm Doing Sealing Work: Horizon Exploration | Date of Abandonment: 7/27/2017

Signature of Person Doing Work | Date Signed

Street or Route: 764 Tower Drive | Telephone Number: 262-377-9060

City, State, Zip Code: Fredonia, WI 53021

FOR DNR OR COUNTY USE ONLY

Date Received | Noted By

QC Qualifiers

Code	Description
B	Analyte detected in the associated Method Blank.
C	Toxicity present in BOD sample.
D	Diluted Out.
E	Safe, No Total Coliform detected.
F	Unsafe, Total Coliform detected, no E. Coli detected.
G	Unsafe, Total Coliform detected and E. Coli detected.
H	Holding time exceeded.
I	BOD incubator temperature was outside acceptance limits during test period.
J	Estimated value.
L	Significant peaks were detected outside the chromatographic window.
M	Matrix spike and/or Matrix Spike Duplicate recovery outside acceptance limits.
N	Insufficient BOD oxygen depletion.
O	Complete BOD oxygen depletion.
P	Concentration of analyte differs more than 40% between primary and confirmation analysis.
Q	Laboratory Control Sample outside acceptance limits.
R	See Narrative at end of report.
S	Surrogate standard recovery outside acceptance limits due to apparent matrix effects.
T	Sample received with improper preservation or temperature.
U	Analyte concentration was below detection limit.
V	Raised Quantitation or Reporting Limit due to limited sample amount or dilution for matrix background interference.
W	Sample amount received was below program minimum.
X	Analyte exceeded calibration range.
Y	Replicate/Duplicate precision outside acceptance limits.
Z	Specified calibration criteria was not met.

QC Qualifiers

Code	Description
B	Analyte detected in the associated Method Blank.
C	Toxicity present in BOD sample.
D	Diluted Out.
E	Safe, No Total Coliform detected.
F	Unsafe, Total Coliform detected, no E. Coli detected.
G	Unsafe, Total Coliform detected and E. Coli detected.
H	Holding time exceeded.
I	BOD incubator temperature was outside acceptance limits during test period.
J	Estimated value.
L	Significant peaks were detected outside the chromatographic window.
M	Matrix spike and/or Matrix Spike Duplicate recovery outside acceptance limits.
N	Insufficient BOD oxygen depletion.
O	Complete BOD oxygen depletion.
P	Concentration of analyte differs more than 40% between primary and confirmation analysis.
Q	Laboratory Control Sample outside acceptance limits.
R	See Narrative at end of report.
S	Surrogate standard recovery outside acceptance limits due to apparent matrix effects.
T	Sample received with improper preservation or temperature.
U	Analyte concentration was below detection limit.
V	Raised Quantitation or Reporting Limit due to limited sample amount or dilution for matrix background interference.
W	Sample amount received was below program minimum.
X	Analyte exceeded calibration range.
Y	Replicate/Duplicate precision outside acceptance limits.
Z	Specified calibration criteria was not met.

A check in a checkbox indicates a positive or "yes" response

Site #2
Gail Business Forms, Inc.
7215 N. 51st Street Blvd.
W. Good Hope Rd: STA 164+20 to 166+20 LT

The site is identified on the UST, LUST (03-41-003414) database. Based on field reconnaissance, the site is currently a commercial building and driveway connected to N. 51st Street Blvd. Review of the Milwaukee County GIS Internet Mapping Site online indicate that the site is owned by Roethel Enterprises, LLC [Ref. 1].

According to the WDATCP Storage Tank Database, one tank is registered to the former address of the site 5100 W. Good Hope Road [Ref.2]. One 2,000-gallon fuel oil UST was closed / removed from the site in June 1993. The occupancy for this tank was listed as 'other'.

According to the EDR report, no Sanborn Map coverage is available for the site. Himalayan's review of historical aerial photographs indicates that the site was vacant land adjacent to the railroad track until the early 1960's. The site was developed into a commercial building and parking lot in the 1960's.

BRRTS # 03-41-003414: In June 1993, the WDNR was notified of petroleum contamination at the west side of the site associated with a former UST [Ref.3]. Based on the report by Drake Environmental, Inc. (Drake), during the tank closure assessment, five PID (1-5) readings were taken beneath UST, east wall, south wall and west wall with readings ranging from 1 to 117. In June 1993, contaminated soil was excavated until PID readings were below 10. Approximately 297.25 tons of impacted soil was excavated and disposed of off-site [Ref.3]

Prior to backfilling with clean materials, 9 final samples were collected from the base and sidewalls (12, 13, 16, 21, 23, 26, 27, 28, 29) of the excavations at depths ranging from 9 to 13.5 feet bgs. All final samples were analyzed for DRO and only sample 12 and 23 were analyzed for PVOC and lead [Ref.3]. According to the report by Drake, all confirmation samples were below their respective DNR guideline limits and no groundwater impact was encountered during the UST or soil removal. In November 1993, the LUST site was closed by the WDNR [Ref.3].

<u>Geology / Hydrogeology</u>
According to Drake, soils at the site mainly consisted of fill material from 0 to 10 feet bgs, underlain by natural clay or silty clay soils from 10 to 14 bgs. Groundwater is estimated to be within 20 feet bgs, and generally flows southeast [Ref. 3].

Based on the USDA NRCS soil survey report, soils along the site consist of Clayey land (Cv) [Ref. 4]. Clayey land is generally described as areas where development activities have either covered over or removed the original solum of the soil, therefore, native soil conditions are no longer

present within the project corridor. This soil type is described as moderately well drained and the depth to groundwater is generally about 12 to 80 inches bgs.

Soil / Groundwater Impacts

According to the report by Drake, all confirmation samples (12, 13, 16, 21, 23, 26, 27, 28, 29) had DRO less than 10 ppm. Sample 12 had low detection of toluene (9 µg/kg) and lead (10 µg/kg) below their NR 720 RCL. Detectable PVOC were also below their NR for sample 23 which had ethylbenzene (2.7 µg/kg), xylene (9.4 µg/kg), and toluene (52.3 µg/kg) [Ref.3].

Based on Drake's report, no groundwater was encountered during the investigation [Ref.3].

It appears the closest soil residual is approximately >100 feet from the current W. Good Hope Road right of way.

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site.

Recommendations

Considering the estimated distance of a former UST from the current W. Good Hope Road right of way (> 100 feet) and no major residual impacts, this site is unlikely to impact the proposed improvements. Therefore, no further investigation is recommended for the site. The need for further investigation should be re-evaluated once the final design information is available.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

Dear Mr. Meissner:

RE: Petroleum contamination at the above address

I have considered your case for closure based on the report submitted by Drake Environmental, Inc., "Soil remediation Documentation Report". I agree with Drake in that no further work is needed regarding the former 2,000 gallon fuel oil tank system. Should environmental problems occur in the future that may be related to the former tank system, you may be required to do more work.

Sincerely,

John Feeney
Hydro, Tank Response Unit

RE: Gail Business Forms, Inc. Located At 5100 West Good Hope Road, Milwaukee

Dear Mr. Meissner:

Please include the above file reference information (i.e., FID #, ERR-LUST) when submitting all correspondence to the Department.

Wisconsin Department of Natural Resources (WDNR) has been notified that petroleum contamination was discovered June 8, 1993 at the above referenced location. Based on the site specific information provided, this case has been assigned to the Medium Priority Rank group. The purpose of this letter is to inform you of your legal responsibilities to address this situation.

Releases from underground storage tanks regulated under Subtitle I of the Resource Conservation and Recovery Act require compliance with the provisions of 40 CFR Parts 280 and 281. The Environmental Protection Agency (EPA) has the authority to take enforcement action at any time, but will generally not take action against parties cooperating with the state. The WDNR proceeds in LUST cases under the authority of s. 144.76, Wisconsin Statutes, commonly referred to as Wisconsin's Hazardous Substance Spill Law. The definition of "hazardous substance" as found in s. 144.01(4m), Wisconsin Statutes, includes petroleum products.

> Wisconsin Statute 144.76(2a) states: "A person who possesses or controls a hazardous substance which is discharged or who causes the discharge of a hazardous substance shall notify the Department immediately of any discharge not exempted under sub.(9)."
>
> Wisconsin Statute 144.76(3) states: "A person who possesses or controls a hazardous substance which is discharged or who causes the discharge of a hazardous substance shall take the actions necessary to restore the environment to the extent practicable and minimize the harmful effects from the discharge to the air, lands, or waters of this state."

Because you possess or control a hazardous substance which has been released to the environment, the Department identifies you as the party responsible for taking the actions necessary to restore the environment. You are required to:

1. Immediately notify the WDNR Spills Hotline at (414) 263-8491 should emergency conditions involving explosive vapors and/or well contamination develop.

Printed on Recycled Paper

2. Conduct an investigation to determine the extent of soil and groundwater contamination.

3. Remediate all of the environmental impacts caused by this situation.

4. Sample private water supply wells which may have been impacted by the release.

The Department suggests that you have a qualified environmental engineer or hydrogeologist direct the remedial investigation, assess the environmental impact, and coordinate the implementation of a cleanup program. Within 15 days of receiving this letter, you should provide the WDNR with the date the remedial investigation will begin.

The Department requires that the location of the tank and/or release be submitted with the work plan. **Requirements for location are Latitude, Longitude, 1/4, 1/4, Township, and Range (east or west).**

Final documentation of the investigation and cleanup should be prepared according to the guidance enclosed and sent to this office on completion of compliance with all applicable federal, state and local laws and regulations. Remedial actions must adequately cleanup contaminated soil and/or groundwater to current WDNR guidelines and/or standards. All product, soil, wastewater, and sludge must be disposed of in compliance with all applicable federal, state and local laws and regulations. Because the Department is experiencing a backlog of leaking underground storage tank cases of emergency status and your case is not currently ranked as an emergency, your submittals will be reviewed as time permits. Investigation and cleanup should not, however, be delayed pending WDNR review of your case.

The WDNR requests that concise LUST project updates be submitted every six months for all medium priority sites; biannual updates will enable WDNR project managers to monitor the status of remedial investigations and/or corrective actions on projects which are not under direct WDNR oversight.

You are encouraged to contact the Department of Industry, Labor, and Human Relations (DILHR), the state agency that administers the Petroleum Environmental Cleanup Fund (PECFA). This fund may reimburse you for eligible costs associated with the remedial investigation and cleanup. DILHR should be contacted at (608) 266-2424 to obtain current information regarding the PECFA program.

Please be aware that your ability to utilize PECFA funds will be dependent on your cooperation in adequately addressing this problem.

Sincerely,

Giselle Red/SK

Giselle Red

APPLICATION TO TREAT OR DISPOSE OF PETROLEUM CONTAMINATED SOIL

Form 4400-120

This form is required by the Department of Natural Resources for leaking underground storage tank sites to ensure that petroleum contaminated soil is treated or disposed of in compliance with NR 500-540, NR 158 and NR 419, Wis. Adm. Code. Failure to comply with applicable statutes and administrative rules may lead to violations of subchapters III and IV of ch. 144, Wis. Stats. and may result in forfeitures of not less than $10 or more than $25,000 for each violation, pursuant to ss. 144.426(1), 144.74 (1), and 144.99, Wis. Stats., or fines of not less than $100 or more than $150,000 or imprisonment for not more than 10 years, or both, pursuant to s. 144.74 (2), Wis. Stats. Each day of a continuing violation constitutes a separate violation. Department approval of this form is required prior to site remediation, except for soils to be buried in landfills.

DIRECTIONS: 1) Complete part I. 2) Select the treatment option in part II. Pretreatment approval is required for any treatment other than landfill burial. Submit this form to the DNR project manager for approval. 3) If your treatment option is landfill burial, complete part III before submitting the ORIGINAL form to the project manager. 4) If soil will be used as cover at a landfill, first submit this form for approval and then, after part III has been completed, resubmit the ORIGINAL to the project manager.

RE: Soil Remediation Documentation associated with the 2,000-gallon fuel oil underground storage tank at the Gail Business Forms property in Milwaukee, Wisconsin — Project No. J93118

Dear Mr. Meissner:

We are pleased to submit the following Soil Remediation Documentation report for the project completed at the above-referenced site. The attached report describes the services that have been provided. The report also presents the results of our field and laboratory testing, and our conclusions and recommendations.

With your approval, a copy of the report will be submitted to the following agencies:

Mr. John Feeney
DNR
4041 North Richards Street
P.O. Box 12436
Milwaukee, WI 53212

We appreciated this opportunity to provide environmental engineering services. If you have questions or are in need of further assistance, please feel free to contact us.

Respectfully,

DRAKE Environmental, Inc.

REPORT SUMMARY

One 2,000-gallon fuel oil underground storage tank (UST) system was removed from the Gail Business Forms, Inc. property, located at 5100 West Good Hope Road in Milwaukee, Wisconsin on June 8, 1993. Drake Environmental, Inc. was retained to conduct a Tank Closure Assessment (TCA). Soil contamination was observed during UST removal, and soil remediation was considered necessary. Drake was further retained to document soil remediation.

Approximately 200 cubic yards of contaminated soils were excavated and transported to Parkview Recycling and Disposal Facility in Menomonee Falls, Wisconsin. Field screening and analytical testing results indicate that adequate soil remediation was accomplished. It is Drake's opinion that additional soil remediation is not warranted.

Groundwater was not encountered during UST or soil removal. However, a small quantity (approximately 20 gallons) of perched water entered the UST cavity during the TCA and the excavation during soil remediation from beneath the concrete loading dock adjacent to the former UST area. It is Drake's opinion that groundwater monitoring is not warranted.

The attached report presents a detailed description of the project and a discussion of the project results.

SOIL REMEDIATION DOCUMENTATION
GAIL BUSINESS FORMS PROPERTY
MILWAUKEE, WISCONSIN

PROJECT SCOPE

Project Description

On June 8, 1993, North Shore Excavating, Inc. removed one underground storage tank (UST) at the Gail Business Forms, Inc. property, located at 5100 West Good Hope Road in Milwaukee, Wisconsin. The UST contained fuel oil and was 2,000 gallons in capacity. Gail Business Forms, Inc. retained Drake Environmental, Inc. to conduct a Tank Closure Assessment (TCA) (Project No. J93096, proposal dated May 17, 1993) during the removal of the UST system. Obvious soil contamination was encountered during the TCA. The extent of contamination, which was limited to the immediate vicinity of the UST cavity, was estimated during the TCA by Drake; therefore, a Remedial Investigation (RI) was not warranted. However, soil remediation was considered necessary. Consequently, Gail Business Forms retained Drake to provide soil removal documentation services. This report documents the procedures followed during the TCA and the laboratory results obtained to confirm the presence of contamination associated with the fuel oil UST at the site. In addition, this report describes the procedures followed during soil remediation and the effectiveness of remediation, and presents Drake's conclusions and recommendations based on the project results.

Site Description

The property is located on the west side of 51st Street along West Good Hope Road on the northwest side of the City of Milwaukee. The site is in the SE 1/4 of the SW 1/4 of Section 14, Township 8N, Range 21E (based on the Thiensville Quadrangle map). The location of the site is illustrated on Figure 1 in Appendix A.

Gail Business Forms provides business form development and distribution services. The site is developed with a one-story building. The building contains office space, storage space, and shipping areas. The facility is currently serviced by municipal

water and sewer systems. The former UST system was located adjacent to a loading dock on the west side of the building. The remainder of the site consists of gravel and concrete parking areas and areas of landscaping. Figure 2 in Appendix A illustrates the site features prior to removal of the UST systems.

In general, the surrounding area is developed with commercial and industrial facilities. The adjacent properties to the north, south, and east are industrial. In addition, a golf course exists to the east. Railroad tracks are located beyond the southwest border of the property. The properties to the west (beyond the railroad tracks) are commercial. All of the adjacent properties are serviced by municipal sewer and water.

The eastern area of the site slopes downward towards 51st Street with an elevation difference of approximately 10 feet over a distance of 100 feet. The western area of the site slopes downward to the northwest with an elevation difference of approximately 5 feet over a distance of approximately 100 feet. A hill slopes upward approximately 15 feet to the railroad tracks at the southwest property boundary. An additional hill exists at the south property boundary and slopes downward approximately 15 feet to West Good Hope Road. The regional ground surface slopes downward to the east with an elevation difference of approximately 50 feet over a distance of approximately 2 miles (based on the Thiensville Quadrangle map).

The surface water bodies in the immediate area include an intermittent stream located approximately 150 feet northwest of the Gail Business Forms property, small ponds approximately 1/2 mile northeast of the site, and the Milwaukee River located approximately 2 miles east of the property.

Scope of Work

Gail Business Forms retained Drake to provide TCA services, document the remediation project, and evaluate the effectiveness of remediation. Mr. John Feeney of the Wisconsin Department of Natural Resources (DNR) was contacted on June 18, 1993, prior to project commencement and approved excavation with landfill disposal as the method of soil remediation.

Drake Environmental, Inc. provided the following services during the project:

- Documented the UST removal procedures
- Documented the condition of the UST system
- Obtained landfill approval for disposal of the contaminated soils
- Documented the soil removal procedures
- Assessed the condition of the soils left in place and the soils excavated during the soil removal activities
- Collected and screened representative soil samples to evaluate the soil conditions during the TCA and soil removal activities
- Submitted representative soil samples to an independent laboratory for analysis
- Evaluated the results of the field and laboratory data and developed conclusions regarding the effectiveness of the project

Gail Business Forms retained North Shore Excavating, Inc. as the environmental contractor for the project. North Shore's services included degassing the UST prior to removal; exposing, removing, cleaning, and disposing of the UST; and obtaining the required permit to dispose of the residual tank material (sludge). In addition, North Shore excavated and transported the contaminated soils to a landfill for disposal and backfilled the resulting excavation. Great Lakes Analytical was retained to provide analytical services during the project.

PROCEDURES

UST Removal Documentation Procedures

One purpose of the TCA was to document the procedures North Shore followed to safely remove the fuel oil UST system. Drake observed and documented the procedures North Shore personnel followed while the UST system was purged of explosive vapors, exposed, removed, and cleaned. Drake also observed and documented the containment of the sludge into a 55-gallon drum. Following UST removal, Drake documented the conditions of the UST system, noting holes, significant corrosion, or other damage.

Drake's field personnel identified the soil profile exposed in the UST cavity in accordance with the Unified Soil Classification System (USCS). Drake also determined whether groundwater or perched water was present in the UST cavity. In addition, Drake observed the backfilling of the cavity with the contaminated soils following completion of UST removal.

Photographs of the site were taken during UST removal.

Soil Removal Documentation Procedures

A Drake environmental technician documented the procedures followed by North Shore to excavate the contaminated soils. Documentation also included recording the extent of soil removal, soil and groundwater conditions encountered, and the methods used to sample and screen soils. Photographs were taken during the soil remediation project.

Soil Sampling and Screening Procedures

The technician collected twenty-nine soil samples for PID screening. The samples were numbered consecutively from 1 to 29, in the order they were collected. Five samples were collected during the TCA. Twenty-four samples were collected during soil remediation, nine of which were representative of soils left in place at the walls and base of the final excavation and fifteen of which were representative of the excavated, landfilled soils. The locations of the nine samples representative of the soils

left in place are illustrated on Figure 3 in Appendix A. The sampling locations of the five samples collected during the TCA and the fifteen samples representative of the soils disposed of at the landfill are not illustrated.

The sampling procedure consisted of either scraping away approximately 2 inches of soil from the excavation walls and base (soils left in place) or recovering representative soil samples from the backhoe bucket (excavated soils). The excavation sampling procedure is described in Appendix B. The samples representative of the in-place and excavated soils were selected from locations, when possible, where observable petroleum odors and/or staining were present. The samples were collected with a stainless steel scoop, which was decontaminated before each use with an Alconox detergent and municipal water solution and rinsed with municipal water. Each sample was transferred to three separate containers: one 2-ounce glass jar, one 4-ounce glass jar, and one 8-ounce glass jar (companion sampling). The 2-ounce jars were new with Teflon-lined plastic screw-on lids, and the 4-ounce and 8-ounce jars were new with metal screw-on lids. The 2-ounce and 4-ounce jars were placed in a cooler filled with ice packs for submittal of selected samples to an independent, certified laboratory for analytical testing.

The 8-ounce samples were screened with an OVM Model 580B photoionization detector (PID) equipped with a 10.6 electron volt (eV) lamp calibrated to isobutylene. The PID screening procedure is described in Appendix B. PID screening provides a qualitative and semi-quantitative measurement of volatile organic compounds (VOCs), which include compounds found in volatile petroleum products. PID readings greater than 10 are generally a reliable indicator of contamination from products containing VOCs. Fuel oil is not significantly volatile; therefore, the PID readings associated with fuel oil are not as meaningful. In addition to the PID screening, the excavated soils were evaluated for the presence of odors and staining to determine when removal could be terminated. The soils were also visually examined and classified on the basis of texture and plasticity in general accordance with the Unified Soil Classification System (USCS).

The 2-ounce and 4-ounce jars were returned to Drake's facility and placed into a refrigerator. Drake chose selected samples for laboratory submittal based on the highest PID readings of the 8-ounce companion samples of the soils left in place and

the locations from which they were collected. The selected samples were shipped in a cooler filled with ice packs to the laboratory within 36 hours for chemical analysis. Drake followed Chain of Custody procedures as outlined in the DNR Leaking UST (LUST) Analytical Guidance (PUBL-SW-130 92 Rev.) throughout collection and laboratory submittal of all samples selected for analytical testing. Appendix C includes copies of the Chain of Custody forms.

Soil Analytical Testing Procedures

The 2-ounce and 4-ounce samples collected during the TCA and soil remediation were returned to Drake's facility and refrigerated. Drake submitted one sample collected during the TCA (sample no. 1) to Great Lakes Analytical, an independent, certified laboratory, to obtain approval for landfill disposal. The sample was analyzed for the following parameters:

- Flash point
- Percent free liquids
- Diesel range organics (DRO)
- Total lead
- Total benzene

Drake submitted a total of nine soil samples (plus one quality control duplicate sample) collected during soil remediation to Great Lakes Analytical for analysis of petroleum-related constituents. Eight of the samples were collected from the walls and base of the final excavation and were analyzed to quantify contaminant concentrations in the soils left in place. One sample was collected from the excavated soils and was analyzed to quantify contaminant concentrations of the soils disposed of at the landfill. Of the nine samples submitted for analysis, the sample which exhibited the highest PID reading in the 8-ounce companion samples was selected for duplicate testing. The testing consisted of quantifying the following petroleum related parameters:

Parameter	Quantity
DRO	9 samples (plus one duplicate sample)
Petroleum VOCs	2 samples
Total lead	2 samples

DRO was quantified following the Wisconsin DNR Modified DRO Method, petroleum VOCs (PVOCs) following EPA Method 8020, and total lead following EPA Method 6010. Seven PVOCs, consisting of those individual compounds common in petroleum fuels, were quantified. Samples submitted for PVOC and total lead analysis were selected from in-place samples that exhibited the highest PID readings. The scope of analytical testing followed guidelines established by the Wisconsin Department of Natural Resources (DNR) in a guidance document (PUBL-SW-130 92 Rev.) dated April 1992.

NOTE: The soil samples not submitted for laboratory analysis will be retained at Drake's facility for a period of 60 days from the date of this report. If the samples should be retained for a longer period of time, written instructions should be submitted to Drake.

RESULTS AND ANALYSIS

UST Removal Documentation

On June 8, 1993, North Shore Excavating, Inc. removed the UST system which consisted of the UST and associated piping. North Shore evacuated explosive vapors and monitored the UST with an explosion meter prior to UST removal. North Shore excavated the soils above the UST and temporarily stockpiled the soils on 4-mil plastic adjacent to the UST cavity. North Shore then removed the UST system. Following removal, North Shore vented and cut a hole in the end of the UST to allow access for cleaning. North Shore removed approximately 14 gallons of sludge from the UST and contained the sludge in a 55-gallon drum. North Shore also collected a representative sample of the sludge for analysis and manifested the drum for disposal. The 55-gallon drum will remain on-site until approval for disposal is obtained from MilSolv Environmental Services in Menomonee Falls, Wisconsin. The sludge disposal manifest will be submitted to the DNR when it is available.

Drake observed approximately forty holes ranging in size from 1/4 inch to 3/4 inch in diameter in the UST. North Shore dismantled and disposed of the UST materials at Detinning Corporation of America in Milwaukee, Wisconsin. The UST disposal manifest is included in Appendix D. The Underground Petroleum Product Tank Inventory Form is included in Appendix E. The checklist for Underground Tank Closure, signed by Mr. Tim Temperly, an inspector for the City of Milwaukee, is also included in Appendix E.

After the UST system and cavity backfill were removed, Drake recorded the soil profile in the cavity and collected representative soil samples. Obvious soil contamination (indicated by elevated PID readings, petroleum odors, and staining) was observed in the soils in the UST cavity. Based on the field results, Drake assumed that approximately 100 cubic yards of contaminated soils existed at the site in the immediate vicinity of the UST. North Shore lined the cavity with 4-mil plastic, replaced the contaminated, stockpiled soils into the cavity, and placed plastic over the contaminated soils. The remainder of the cavity was backfilled with imported gravel fill.

Representative photographs documenting the UST removal activities are included in Appendix F.

Soil Removal Documentation

North Shore excavated the contaminated soils on June 22, 1993. Soil removal began at the former UST location and advanced west and south. Removal was limited to the east by the office building and to the north by a concrete loading dock. The final excavation was approximately 29 feet by 14 feet in plan size, with a depth of approximately 13 to 14 feet. Figure 3 in Appendix A illustrates the extent of the excavation.

Soils with petroleum odors, staining, or PID readings above 10 were excavated, where possible. Removal was terminated where soils did not exhibit these characteristics or where additional removal could not be accomplished due to the possibility of structural damage to buildings or utilities on-site. The excavated soils exhibited petroleum odors and PID readings ranging from 1 to 307.

North Shore loaded 297.25 tons (approximately 200 cubic yards) of contaminated soils directly onto trucks and transported the soils to Parkview Recycling and Disposal Facility in Menomonee Falls, Wisconsin. Fifteen truckloads of contaminated soils were disposed of at the landfill. Following completion of the soil removal activities, Drake recorded the soil profile in the excavation and collected representative soil samples. North Shore then backfilled the final excavation with imported crushed concrete.

Representative photographs documenting the soil removal activities are included in Appendix F.

Soil Conditions

The soils encountered in the UST cavity consisted of sand/gravel fill material overlying natural clay soils. The fill material consisted of brown, fine to coarse sand and gravel to an approximate depth of 10 feet. The soils encountered at the walls of the excavation consisted of fill material overlying natural clay soils. The fill material consisted of silty clay with crushed concrete and gravel. Silty clay soils with

occasional fine sand seams were generally present between approximately 10 and 14 feet, the vertical extent of the excavation. The natural clay soils were generally yellow-brown in color. Drake noted petroleum odors and staining in the soils removed from the former UST area.

The fill materials on-site would be expected to exhibit moderate permeabilities. The natural soils on-site would be expected to exhibit relatively low permeabilities, except for the more permeable sand seams within the clay soils. Consequently, the migration of petroleum contaminants is expected to be limited to the sand seams and fill material.

Groundwater Conditions

Groundwater was not encountered in the UST cavity during the TCA or soil removal activities. However, a small quantity of perched water (approximately 5 gallons during the TCA and 15 gallons during soil removal) originating from beneath the loading dock had accumulated at the base of the excavation. A slight petroleum sheen was present on the water during the TCA, but not during soil remediation. Based on topographic and geologic data, Drake assumes groundwater to exist within 20 feet of the ground surface. Groundwater flow is likely southeast (based on the Thiensville Quadrangle map).

Soil Screening Results

Table 1 presents the results of the PID screening of the soil samples obtained during the TCA and soil remediation projects. Sample nos. 1 through 5 were collected during the TCA and sample nos. 6 though 29 were collected during soil remediation.

TABLE 1
PID Screening Results — Soil Samples

Sample No.	Representative Location	Depth (ft.)	PID Reading (no units)
1	UST cavity - beneath UST	8	177
2	UST cavity - beneath UST	12	22
3	UST cavity - east wall	4	1
4	UST cavity - south wall	5	1
5	UST cavity - west wall	7	16
12	East wall	10.5	**12**
13	South wall	9	**2**
16	Base	14	**5**
21	Base	13.5	6
23	South wall	11	**8**
26	West wall	9	**<1**
27	North wall	10	**2**
28	North wall (base)	12	**1**
29	Base	14	**1**
6	Landfilled soils	2.5	60
7	Landfilled soils	5	32
8	Landfilled soils	5	25
9	Landfilled soils	8	**285**
10	Landfilled soils	9	191
11	Landfilled soils	10.5	154
14	Landfilled soils	11	36
15	Landfilled soils	13	132
17	Landfilled soils	12	122
18	Landfilled soils	12	307
19	Landfilled soils	13	164
20	Landfilled soils	12	65
22	Landfilled soils	10	35
24	Landfilled soils	11	12
25	Landfilled soils	14	1

Note: The readings in bold represent samples submitted for laboratory analysis.

To evaluate the significance of the PID readings, Drake compared the data to the DNR guideline limit of 10. PID readings greater than 10 are frequently considered an indication of contamination. The PID results of samples collected during the TCA indicate that three of the five samples exhibited PID readings above 10. The sample collected immediately beneath the center of the UST (sample no. 1) exhibited a PID reading of 177 and exhibited petroleum odors and staining indicative of contamination. The sample collected from the natural clay soils 4 feet beneath the center of the UST (sample no. 2) exhibited a PID reading of 22 and exhibited slight petroleum odors and staining. The sample collected from the west wall of the UST cavity (sample no. 5) exhibited a PID reading of 16, but did not exhibit petroleum odors or staining. The

samples collected from the east and south walls of the UST cavity (sample nos. 3 and 4) exhibited PID readings of 1. Based on these PID readings, Drake assumed that approximately 100 cubic yards of contaminated soils existed at the site in the immediate vicinity of the UST cavity.

The PID results of the soils left in place following soil remediation indicate that eight of the nine soil samples exhibited readings below 10. None of these samples exhibited petroleum odors or staining indicative of contamination. The sample collected from the east wall of the excavation, adjacent to the building foundation (sample no. 12), exhibited a PID reading of 12, but did not exhibit petroleum odors or staining. The samples collected from the south wall (sample nos. 13 and 23) exhibited PID readings of 2 and 8; the sample collected from the west wall (sample no. 26) exhibited a PID reading of less than 1; the samples collected from the north wall, adjacent to the loading docks (sample nos. 27 and 28), exhibited PID readings of 2 and 1; and the samples collected from the base of the excavation (sample nos. 16, 21, and 29) exhibited PID readings of 5, 6, and 1. Based on these PID results, adequate soil removal was apparently accomplished at the north, south, and west walls, and the base of the excavation.

The results of the PID screening of the fifteen samples representing the excavated, landfilled soils range from 1 to 307: one in the range of 1 to 10, seven in the range of 10 to 100, five in the range of 100 to 200, and two greater than 200. All of the soils transported to the landfill exhibited petroleum odors and/or staining. The PID results and field observations indicate that the excavated soils were apparently contaminated.

Soil Sample Analytical Results

The analytical results of the sample collected to obtain landfill approval (sample no. 1) are not included in the text of this report. However, a copy of the laboratory report is included in Appendix C. In summary, the DRO result (2,400 parts per million (ppm)) was above established allowable limits to dispose of the soils at a landfill (2,000 ppm). Therefore, a written variance for landfill disposal was requested. On June 21, 1993, Mr. John Feeney of the DNR provided the variance and landfill approval was received.

Table 2 presents the results of the DRO testing of selected soil samples. A copy of the laboratory report is included in Appendix C.

TABLE 2
DRO Results — Soil Samples

Sample No.	Depth (ft.)	Representative Location	PID Reading (nu)	DRO (ppm)
12	10.5	East wall	12	<6.0
13	9	South wall	2	7.2
16	14	Base	5	<5.7
23	11	South wall	8	<5.8
26	9	West wall	<1	<6.8
27	10	North wall	2	7.0
28	12	North wall (base)	1	<5.6
29	14	Base	1	<6.1
9	8	Landfilled soils	285	**120**
*9	8	Landfilled soils	285	**62**

nu = no units
ppm = parts per million
*duplicate sample

Drake compared the DRO results to the DNR guideline limit of 10 parts per million (ppm). Concentrations greater than 10 ppm are an indication that petroleum contamination exists. The DRO results of the samples collected from the soils left in place in the final excavation indicate a concentration of 7.2 ppm along the south wall of the excavation (sample no. 13) and 7.0 ppm along the north wall of the excavation (sample no. 27). These concentrations are below the guideline limit of 10 ppm. In addition, other samples collected from the north and south walls (sample nos. 23 and 28, respectively) did not contain detectable concentrations of DRO. The samples representing soils left in place along the east wall, west wall, and the base of the excavation did not contain detectable concentrations of DRO.

The DRO results for sample no. 9, representative of the excavated, landfilled soils was 120 ppm (62 ppm in the duplicate sample). The DRO results therefore confirm that the excavated, landfilled soils were contaminated.

Table 3 presents the results of the PVOC and total lead testing of two samples representing soils left in place (sample nos. 12 and 23). A copy of the laboratory report is presented in Appendix C.

TABLE 3
PVOC and Total Lead Results — Soil Samples

Parameters	Sample No. 12 (ppm)	Sample No. 23 (ppm)
PID	12 (nu)	8 (nu)
DRO	<6.0	<5.8
Benzene	<0.0024	<0.0024
Ethylbenzene	<0.0024	0.0027
Methyl tert-Butyl Ether	<0.060	<0.060
1,2,4-Trimethylbenzene	<0.012	0.035
1,3,5-Trimethylbenzene	<0.012	<0.012
Xylenes - total	<0.006	0.0094
Toluene	0.009	0.0052
Total PVOCs	0.009	0.0523
Total Lead	10.0	<5.8

ppm = parts per million
nu = no units

PVOC standards for soils are not currently published by the DNR. One PVOC compound (toluene) was detected in the sample collected from the east wall of the excavation (sample no. 12). Four PVOC compounds (ethylbenzene, 1,2,4-trimethylbenzene, xylenes, and toluene) were detected in the sample collected from the south wall of the excavation (sample no. 23). Because the total PVOC concentration in each sample is substantially less than 1 ppm (0.009 ppm in sample no. 12, and 0.0523 ppm in sample no. 23), the PVOC concentrations are not considered significant. The PVOC compounds detected are common in fuel oil.

Total lead standards for soils are also not currently published by the DNR. Concentrations of total lead less than 100 ppm are generally not considered significant. Therefore, the concentration of total lead (10.0 ppm) detected in the sample collected from the soils left in place at the east wall of the final excavation (sample no. 12) is not considered significant. Total lead was not detected in the sample collected from the soils left in place at the south wall of the final excavation (sample no. 23).

CONCLUSIONS AND RECOMMENDATIONS

Conclusions

Approximately 200 cubic yards of contaminated soils, as a result of leakage from the former 2,000-gallon fuel oil UST system, were excavated and transported to Parkview Recycling and Disposal Facility for disposal. PID screening and analytical testing results of samples representative of the soils left in place indicate that adequate soil removal was accomplished. Therefore, it is Drake's opinion that additional soil remediation is not warranted.

Groundwater was not encountered during the soil removal. Therefore, it is Drake's opinion that groundwater monitoring is not warranted.

Recommendations

It is recommended that no further soil remediation be completed at this time. It is also recommended that groundwater monitoring not be conducted.

A copy of this report should be submitted to the DNR.

General Qualifications

Drake conducts its services with that degree of care and skill ordinarily exercised by members of the engineering community practicing under similar conditions at the same time in the same or similar locality.

The field and engineering procedures Drake followed in completing this project are in general accordance with applicable regulations of the Wisconsin DNR and DILHR at the time the work was conducted. If the applicable regulations change, the DNR may require further investigation.

The results, conclusions, and recommendations presented in this report are based on the data obtained from the specific sampling locations at the times and under the conditions stated in this report. Variations in soil and groundwater conditions typically

exist at most sites between the sampling locations and, also, between specified periods of time, the extent of which may not become evident without further exploration or excavation. If variations are noted in the future, Drake should be informed. It may be necessary to conduct additional explorations and observations to determine the characteristics of these variations, and provide a re-evaluation of the conclusions in this report.

This study was also completed to identify potential economic liabilities. Drake assumes no responsibility for the discovery and elimination of hazards that could possibly cause accidents, injuries, or damage. Compliance with the recommendations and/or suggestions contained in this report in no way assures elimination of hazards or a fulfillment of a property owner's obligation under local, state, or federal laws. It is the responsibility of the property owner to notify authorities of any conditions that are in violation of the current legal standards.

Some of the factual information in this report was obtained from the client, client's agents, and third parties, and are assumed by Drake to be correct and in compliance. Because the facts stated in this report are subject to professional interpretation, they could result in differing conclusions. In addition, the findings and conclusions contained in this report are based on various factors as they existed at the time of this study. Changes or modifications to the site and/or facilities made after the site visit are not included.

Drake prepared this report at the request of its client. Drake assumes responsibility for the accuracy of the contents of this report subject to what is stated elsewhere in this section, but recommends the report be used only for the purpose intended by the client and Drake when the report was prepared. The report may be unsuitable for other uses and reliance of its contents by anyone other than the client is done at the sole risk of the user. Drake accepts no responsibility for application or interpretation of the results by anyone other than the client.

DRAKE Environmental. Inc. *ENGINEERING CONSULTANTS*	PROJECT NUMBER J93118 DRAWN BY JGT DATE: 06/09/93	GAIL BUSINESS FORMS SOIL REMEDIATION EXTENT OF EXCAVATION DIAGRAM	FIGURE 3

EXCAVATION SAMPLING PROCEDURE

The excavation sampling procedure consists of collecting a soil sample from a newly exposed surface or from the bucket of the excavating equipment. If necessary, soils are scraped away to expose soils that have not been exposed to the atmosphere. The sample is recovered with a stainless steel scoop and is therefore disturbed. However, the sample is representative of soil at a discrete location and can be placed into a container for future classification, screening, and analysis.

PID SCREENING PROCEDURE

To determine if soils have been contaminated by volatile organic compounds (VOCs), soil samples are screened with a OVM Model 580B photoionization detector (PID) equipped with a 10.6 electron volt (eV) lamp calibrated to isobutylene. The PID provides a qualitative and semi-quantitative measure of VOCs with ionization potentials less than 10.6 eV, which include those present in the more volatile petroleum fuels and solvents.

A representative portion of soil is placed in an 8-ounce glass jar and sealed with a metal lid. The jar is filled about half full. The sealed container is allowed to warm to approximately 70°F for a minimum period of 15 minutes. The actual time period the samples are allowed to warm is in general accordance with the DNR guideline set forth in "LUST Field Screening Procedures," PUBL-SW-176, September 1992. The lid of the container is slightly opened, the PID tip is inserted into the headspace (area in the jar above the soil), and the highest reading on the meter is recorded.

The Wisconsin Department of Natural Resources (DNR) considers PID values greater than 10 an indication of contamination from VOCs. However, lower readings do not necessarily indicate the absence of contamination, because a nonvolatile contaminant may be present. PID readings are not as meaningful when nonvolatile contaminants are present. In addition, the PID does not identify the types of chemicals present. All results should be evaluated by considering the contaminants present and the limitations of the PID meter.

A check in a checkbox indicates a positive or “yes” response

Site #3
Tripoli Country Club Maintenance Building
7220 N. 51st Street (7401 N. 43rd Street)
W. Good Hope Rd: STA 167+55 to 170+00 LT

The site is identified on the UST, SHWIMS, and RCRA-VSQG databases. Based on field reconnaissance, the site is currently part of the golf course maintenance area for the Tripoli Country Club at 7401 N. 43rd Street with a pole barn and parking lot. Review of the Milwaukee County GIS Map Server online indicated that the site is owned by TRIPOLI GOLF CLUB [Ref. 1].

According to the Wisconsin Department of Agriculture, Trade and Consumer Protection (DATCP) Storage Tank Database one tank is registered to the site with a street address of 7220 N. 51st Street [Ref.2]. One 1,000-gallon leaded gasoline UST was closed / removed from the site in October 1991. The occupancy for this tank was listed as 'other'. The RCRA-VSQG designation is most likely associated with the one-time generation of waste during tank removal / cleaning activities.

According to the EDR report, no Sanborn Map coverage is available for the project corridor.

Himalayan's review of historical aerial photographs indicates that a structure has been at the site since the 1930s. This structure was razed in the 1970s and reconstructed with the current pole barn and several smaller buildings.

Geology / Hydrogeology

Based on the USDA NRCS soil survey report, soils along the site consist of Clayey land (Cv) [Ref. 3]. Clayey land is generally described as areas where development activities have either covered over or removed the original solum of the soil, therefore, native soil conditions are no longer present within the project corridor. This soil type is described as moderately well drained and the depth to groundwater is generally about 12 to 80 inches bgs.

Soil / Groundwater Impacts

Based on Himalayan's record search, an underground storage tank closure assessment was performed by Advent Environmental Services, Inc. (Advent) at the site in October 1991. Based on this assessment, two USTs located near the maintenance garage were cleaned / removed and soil confirmation samples collected underneath each tank prior to backfilling with clean material. According to Advent no obvious soil contamination was detected and no groundwater was encountered during the tank removal. Lab analyses also indicated that no petroleum was released from the UST systems [Ref. 4]. The former USTs were located near the northwest corner of the pole barn (~200 feet from the current N. 51st Street and W. Good Hope Road right of way).

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site.

Recommendations

Considering the current status of the USTs (closed/removed) and tank closure assessment results (no release detected), this site should not impact the proposed improvements. Therefore, no further investigation is recommended for the site.

The need for further investigation may need to be re-evaluated once the final design information is available.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

Dear Mr. Belfield:

Enclosed is the Underground Storage Tank Closure Assessment for the Tripoli Country Club site, located at 5032 West Good Hope Road, Brown Deer, Milwaukee County, Wisconsin, AESI Project No. 96617.

Copies of the assessment must be submitted to both the Wisconsin Department of Industry, Labor and Human Relations, and the Wisconsin Department of Natural Resources at the following addresses:

Wisconsin Department of Industry, Labor and Human Relations
Bureau of Petroleum Inspection and Fire Protection
P.O. Box 7969
Madison, WI 53707

Mr. Brad Wolbert
Wisconsin Department of Natural Resources
P.O. Box 7921
Madison, WI 53707

The Department of Natural Resources will review the assessment and based on the detection levels identified and the specific features of the site, a decision will be made on whether further action or investigation is required.

If you have any questions regarding these results, please do not hesitate to contact me.

Sincerely,

ADVENT ENVIRONMENTAL SERVICES, INC.

1.0 SUMMARY

Advent Environmental Services, Inc. (AESI) was contracted by James Belfield of the Tripoli Country Club to conduct an Underground Storage Tank (UST) Closure Assessment for the removal of a 1,000-gallon UST and a 550-gallon UST. Both USTs contained regular gasoline and were located at the Tripoli Country Club, 5032 West Good Hope Road, Brown Deer,, Milwaukee County, Wisconsin. The UST closure assessment was completed on October 2, 1991 and included the following:

* Excavation and disposal of one 1,000-gallon gasoline UST and one 550-gallon gasoline UST according to Wisconsin Department of Industry, Labor and Human Relations (WDILHR) regulations.
* Screening of the tank beds for volatile organic compounds (VOCs) with a photoionization detector (PID).
* Collection and chemical analysis of four soil samples from the excavation areas for gasoline range organic (GRO) compounds.
* Disposal of one 55 gallon drum of UST sludge at Hydrite Chemical, Inc., Milwaukee, Wisconsin.
* Documentation of sampling procedures and soil and groundwater conditions at the tank bed excavations.

Results of the assessment indicate that the soils at the site are not contaminated with GROs above the 10 ug/g WDILHR remedial action level for

petroleum-contaminated soil. Field screening of the tank beds with a PID did not indicate any VOC concentrations above background levels.

Groundwater was not encountered in either tank bed excavation, which reached a depth of 9.0 feet in Tank Bed #1 and 5.5 feet in Tank Bed #2. Based on the lack of soil contamination, groundwater is not believed to be contaminated by gasoline.

AESI recommends no further investigative or corrective action at the Tripoli Country Club site.

2.0 SITE DESCRIPTION

2.1 Introduction

This section describes the location and geologic setting of the site.

2.2 Site Location

The Tripoli Country Club site is located in a residential area at 5032 West Good Hope Road, Brown Deer, Wisconsin. The legal description of the site is SE1/4, Section 14, T8N, R20E. The site is located on the north side of Good Hope Road (County Trunk Highway PP) between 43rd and 51st streets (see Figure 2-1).

2.3 Site Geology

The site is located in the Eastern Ridges and Lowlands Physiographic Province of southeastern Wisconsin. Glaciation has been an important geologic agent in determining the surface geology and physiography of the site. The site is situated on a ground moraine that was deposited during the Wisconsinan glacial stage.

Ozaukee silt loam, which is well drained to somewhat poorly drained and has a silty-clay loam subsoil, is the dominant type of soil at the site. Densely packed brown silty clays were encountered throughout the excavated areas, which reached a maximum depth of 9.0 feet.

Bedrock was not encountered in either tank bed excavation. Regionally, bedrock consists of Silurian age dolomite.

Local topography consists of a broad flat plain. Relief at the site is very flat, with the ground surface sloping to the east locally and regionally.

Groundwater was not encountered in either tank bed excavation. Therefore, neither the elevation of the water table nor the hydraulic gradient could be determined. Based on surface topography, however, groundwater is believed to be moving toward the Milwaukee River, approximately 1,100 feet east of the site.

3.0 ASSESSMENT PROCEDURES AND FIELD OBSERVATIONS

3.1 Introduction

This section outlines assessment procedures and field observations for the closure assessment of the Tripoli Country Club site. Individual subsections include information obtained from the regulatory background review, site background review, and reconnaissance inspection.

3.2 Site Representative Interview

An interview was conducted for the purpose of gathering information concerning present and past uses of the Tripoli Country Club site and the potential environmental impact of these activities. Mark G. Riha of AESI conducted a telephone interview on October 3, 1991, with Mr. James Belfield, the golf course superintendent. Mr. Belfield's telephone number is (414) 351-7218.

3.3 Site History

According to Mr. Belfield, one 1,000-gallon gasoline UST was installed on-site in the late 1960s. The 550-gallon UST was installed in 1986. The tanks were used to refuel golf course maintenance vehicles.

3.4 Field Observations

Mark G. Riha of AESI arrived at Tripoli Country Club site on October 2, 1991 to observe the removal of two USTs located at the site. The

following individuals and contractors were also on-site during the removal activities:

* Autoquip, Inc. - UST removal contractor
* National Tank Services, Inc. - UST cleaning/disposal contractor
* Mr. James Belfield - Tripoli Golf Course Superintendent

The Tripoli Country Club site is bound on the north by Calumet Road, the east by 43rd Street, the south by West Good Hope Road, and the west by 51st Street.

Access to UST bed #1 was gained through a driveway off of 51st Street. A 120-by 50-foot golf course maintenance garage is located approximately 100 feet east of the curb for 51st Street. The fuel pump for the 1,000-gallon gasoline UST was located approximately 16 feet northwest of the northwest corner of the garage. The UST was located approximately 6.0 feet west of the pump island.

Access to UST #2 was gained through the main entrance on 43rd Street. The Country Clubhouse is located here. The 550-gallon gasoline UST was located on the west side of the clubhouse. The fuel pump was located approximately 9.0 feet north of the golf cart garage. The pump was located directly above the 550-gallon UST, which was buried under asphalt.

Upon removal of both USTs, a soil sample was collected from each end of both tanks as part of the closure assessment for the tanks.

Soil contamination was not apparent upon excavation of either tank bed. The tank beds did not have a petroleum odor. Screening of the excavation tailings and walls with a PID did not indicate VOC concentrations significantly above background levels. The tank beds were not overexcavated and were backfilled with original soil and overlain by clean sand and gravel.

The two USTs and associated piping appeared to be in very good condition. There was no visible rust holes in the tanks or piping. Soil remaining in the tank beds did not show any evidence of contamination (i.e., stained soil). UST abandonment documentation is included in Appendix A. The Checklist for Underground Storage Tank Closure is included in Appendix B.

Figure 3-1 depicts the location of UST #1, and Figure 3-2 depicts the location of UST #2. Photographs of the site are provided in Appendix C.

4.0 SAMPLING AND ANALYTICAL PROCEDURES

4.1 Introduction

This section outlines procedures followed for collecting soil samples, maintaining security and integrity of the samples, and performing chemical analysis of the samples.

4.2 Sampling Procedures

Soil samples were collected from native soils within the tank beds to determine if soil at the site was contaminated. All soil samples were collected by an individual qualified in sampling and handling procedures (see Appendix G).

Soil Sampling Procedures

Soils from the tank beds were field screened with a PID for VOCs on a two foot grid as the tank beds were being excavated. Soil samples were collected from the excavations with a hand auger or trowel in such a manner that caused the least disturbance to the samples. Samples were collected in native soil one to three feet beneath the bottom of each end of the tank.

Whenever hand held tools were used to collect samples, at least the top three inches of soil was scraped away and discarded before sampling so that the sample could be collected from a previously unexposed soil area.

One soil sample was collected to field screen the soil using the following headspace techniques:

1. Headspace samples were collected in four-ounce glass jars that had been thoroughly cleaned with a water/detergent solution and triple rinsed with distilled water.

2. The jars were filled half full to a fill-line marked on the outside of the jar.

3. Immediately after the headspace sample was placed in the jar, the mouth of the jar was covered with a heavy gauge aluminum foil or a tight-fitting cap or collar equipped with a tight-fitting septum.

4. Once the headspace sample was sealed, the sample was agitated for at least 30 seconds to break soil clods and release vapors.

5. After the sample had been agitated, the sample was allowed to equilibrate for 20 minutes at approximately 70^{o}F out of direct sunlight.

6. Following equilibration, the sample headspace was analyzed by inserting the tip of the PID probe through a single, small hole in the foil seal to a position half-way between the seal and sample surface and then recording the highest instrumental reading. No meter "quenching" was observed.

7. The PID was properly maintenanced and calibrated according to the manufacturer's specifications at the site at least daily before commencing field operations. Results of the calibration are recorded on a calibration log sheet (see Appendix D).

An additional sample was collected for laboratory analysis at the same time as that of the headspace sample. The following procedures were used in preparing samples for shipment to an analytical laboratory for analysis:

1. The split sample was tightly packed into a labelled clean, four-ounce, wide-mouth, glass jar with a Teflon™-lined lid and preserved by cooling to 4°C.
2. Sample labels were firmly affixed to the sample container prior to placing the sample in the container. Labels were completed in waterproof ink and included the following information:
    * Sample Number
    * Project Name
    * Location
    * Date and Time
    * Analysis to be Completed
    * Name of Sampler

All sampling tools were washed with an Alconox™ and reagent water solution between sampling points to prevent cross contamination.

4.3 Chain of Custody Procedures

This section describes procedures used for sample identification and chain of custody. The purpose of these procedures is to ensure security and integrity of the sample from collection through transportation, storage, and analysis.

Sample identification documents were carefully prepared so that sample identification and chain of custody were maintained and sample disposition was controlled. Sample identification documents include:

* Field Notebooks
* Sample Labels
* Chain of Custody Records

A chain of custody record was fully completed in triplicate by the AESI sampler immediately following sample collection (see Appendix E).

Transfer of Custody Shipment

The samples were packed in a cooler and were accompanied by the chain of custody record. When transferring samples, the individuals relinquishing and receiving them signed, dated, and noted the time on the chain of custody record. This record documents sample custody.

Laboratory Custody Procedures

A designated sample custodian accepted custody of the shipped samples and verified that the sample identification numbers matched those on the chain of custody record. A copy of the completed chain of custody record was retained by the laboratory until analyses were complete. The record was then transferred to the site file with the analytical results.

5.0 FIELD AND ANALYTICAL RESULTS

5.1 Introduction

This section summarizes sample locations and results of field screening of soil samples for VOCs with a PID and the results of the chemical analyses of four soil samples for GROs.

5.2 Sample Locations

Mark G. Riha of AESI collected two soil samples for headspace analyses and two soil samples from each of the tank beds for chemical analyses at the Tripoli Country Club site. See Figure 5-1 for soil sampling locations in tank bed #1, and Figure 5-2 for soil sampling locations in tank bed #2.

Subsurface soil samples were collected from the following locations:

Sample	Location	Depth(ft)	HNU (ppm)
TCS-1	East End; UST #2	5.5	0
TCS-2	West End; UST #2	5.5	0
TCS-3	East End; UST #1	9.0	0
TCS-4	West End; UST #1	9.0	0

5.3 Results of Headspace Field Screening Survey

Results of the headspace field screening survey indicated that upon completion of the tank bed excavation, VOC contamination was not present in any of the soil samples collected from the walls and base of either tank bed.

5.4 Analytical Methods Utilized for Chemical Analyses of Samples

Aqua-Tech, Inc. Laboratories in Port Washington, Wisconsin, analyzed the four soil samples collected on October 8, 1991 at the Tripoli Country Club site. These soil samples were chemically analyzed using the analytical methods indicated on the laboratory reports in Appendix F.

Each analytical method follows specific quality control (QC) criteria listed in the reference manual describing the method. This includes the selection and calibration of appropriate instruments and the use of QC samples. Daily performance tests and the demonstration of precision and accuracy in the laboratory are required.

5.5 Results of Chemical Analyses of AESI-Collected Samples

Soil Samples

Chemical analyses of four soil samples yielded the following results:

* No GROs were identified in soil samples TCS-1, TCS-2, TCS-3, and TCS-4 above the 5.0 ug/g laboratory detection

limit. All GRO results were calculated on a dry weight basis as required by WDILHR.

Table 5-1 contains complete results of the chemical analyses of the soil samples.

GRO(ug/g)*	ND	ND	ND	ND	5.0
PID Levels (ppm)	0	0	0	0	—

* All GRO results were calculated on a dry weight basis as required by the WDILHR.

ND Not Detected

6.0 DISCUSSION

6.1 Introduction

This section discusses data and information that apply to observed and potential contamination that may be attributable to the USTs removed from the Tripoli Country Club site.

6.2 Soil

Headspace field screening of soil samples collected from the excavated tank beds with a PID indicated no VOCs significantly above background levels.

No GROs were detected by laboratory analysis in the four subsurface soil samples collected from the tank beds at concentrations above the WDILHR remedial action level of 10 ug/g for petroleum-contaminated soil.

6.3 Groundwater

Groundwater was not encountered in either excavation, which reached maximum depths of 9.0 feet. Based on field screening and on chemical analyses of the subsurface soil samples that indicated no GRO contamination, it is believed that groundwater contamination has not occurred at this site.

7.0 RECOMMENDATIONS

After completing the UST closure assessment for the Tripoli Country Club site located at 5032 West Good Hope Road, Brown Deer, Milwaukee County, Wisconsin, AESI recommends no further investigative or corrective action. Based on field screening and on analytical results of samples collected from native soil, soil is not believed to be contaminated in the area surrounding the tank beds.

Wisconsin Department of Industry, Labor and Human Relations

UNDERGROUND PETROLEUM PRODUCT TANK INVENTORY

Send Completed Form To:
Safety & Buildings Division
P.O. Box 7969
Madison, WI 53707
Telephone (608) 267-5280

For Office Use Only:
Tank ID #

This form is to be completed pursuant to Section 101.142, Wis. Stats., to register all underground tanks in Wisconsin that have stored or currently store petroleum or regulated substances. Please see the reverse side for additional information on this program. An underground storage tank is defined as any tank with at least 10 percent of its total volume (included piping) located below ground level. A separate form is needed for each tank. Send each completed form to the agency designated in the top right corner.

This registration applies to a tank that is (check one):
1. ☐ In Use
2. ☐ Abandoned With Product
3. ☐ Abandoned No Product (empty) or With Water
4. ■ Abandoned - Tank Removed
6. ☐ Abandoned - Filled With Inert Material
7. ☐ Out of Service
8. ☐ Changed Ownership (Indicate new owner in section A. 4. below)

F. METHOD OF ACHIEVING 10% LEVEL DESCRIPTION

(*) Educator Or Diffused Air Blower

Eductor driven by compressed air, bonded and drop tube left in place; vapors discharged minimum of 12 feet above ground. Diffused air blower bonded and drop tube removed. Air pressure not exceeding 5 psig.

Dry Ice

Dry ice introduced at 1.5 pounds per 100 gallons of tank capacity. Dry ice crushed and distributed over the greatest possible tank area. Dry ice evaporated before proceeding.

Inert Gas (CO/2 or N/2) NOTE: INERT GASSES PRODUCE AN OXYGEN DEFICIENT ATMOSPHERE. THE TANK MAY NOT BE ENTERED IN THIS STATE WITHOUT SPECIAL EQUIPMENT

Gas introduced through a single opening at a point near the bottom of the tank at the end of the tank opposite the vent. Gas introduced under low pressure not to exceed 5 psig to reduce static electricity. Gas introducing device grounded.

Tank atmosphere monitored for flammable or combustible vapor levels.

Calibrate combustible gas indicator. Drop tube removed prior to checking atmosphere. Tank space monitored at bottom, middle and upper portion of tank. Readings of 10% or less of the lower flammable range (LEL) obtained before removing tank from ground.

PHOTOIONIZATION DETECTOR CALIBRATION DOCUMENTATION

SITE NAME: Tripoli Country Club DATE: 10-2-91

SIGNATURE: _____ TIME: _____

AMBIENT TEMPERATURE: 70°F

SAMPLE EQUILIBRATION TEMPERATURE: 70°F

WEATHER CONDITIONS: Windy, overcast

HNU Model PI 101, Advent Environmental Services, Inc. number 1 was calibrated with 101 parts per million Isobutylene calibration gas which is equivalent in response to 65 parts per million benzene at a gain setting of 7.35 with a 11.7 electron volt (Ev) lamp.

ERRATIC READINGS: _____

REPAIRS OR CLEANING: _____

PROCEDURE FOR DAILY CALIBRATION CHECK

A. Battery check - Attach probe to unit. Turn function switch to BATT. The needle should be in the green region. If not, recharge the battery.

B. Allow unit to operate on STANDBY until the unit has reached ambient conditions or until a stable reading is obtained.

C. Zero set - Instrument should be zeroed on site if possible. Turn function switch to STANDBY. Listen to make sure fan is operating. Set the zero point with the ZERO set control.

D. Calibration - Attach calibration gas to end of probe extension. Adjust SPAN control setting to obtain the necessary meter reading. If meter does not respond, or if the correct reading cannot be adjusted, the unit must be serviced or cleaned.

The above calibration procedure is taken from Calibration Procedure, section 3.4, of the Instruction Manual, Trace Gas Analyzer, HNU Model 101, December, 1985.

April 29, 1991

INTERIM CERTIFICATION UNDER ILHR 10

MARK G RIHA
2520 N STOWELL AVE #301
MILWAUKEE, WI 53211

You have been issued an interim certification to perform the following tank-related services:

Installation: [ ]

Removal and Cleaning: [X]

Tightness Testing: [ ]

Tank Relining: [ ]

Site Assessment: [X]

By May 1, 1992, you must take and successfully pass the certification test for the tank system service specialities that you wish to perform in the State of Wisconsin.

The interim certification which has been issued to you is not a full certification under ILHR 10. An individual who holds an interim certification may not list or advertise that they are certified by the State of Wisconsin.

This interim certification allows an individual to conduct work in the state until May 1, 1992, during which time they are preparing for and completing a formal certification. A holder of an interim certification must adhere to all of the requirements and procedures required in ILHR 10 for a person with a full certification. This includes providing on-site supervision of work at the milestones identified in ILHR 10.

The individual with an interim certification is required to have a copy of the state code, observe all safety practices and to have and be using necessary safety equipment. Failure to meet the requirements of the code will result in a removal of the interim (or permanent) certification.

You can obtain a copy of ILHR 10, for $3.00 per copy plus the sales tax applicable to your county (if from Wisconsin) from:

Document Sales
P.O. Box 7840
Madison, WI 53707.

An individual obtaining an interim certification will be notified of exam centers as they are scheduled. The Department will make every effort to schedule an adequate number of exam opportunities. The individual applicant, however, is responsible for scheduling their activities so that a final certification is obtained prior to the May 1, 1992 deadline.

Certifications issued in other states will not qualify an individual for work in Wisconsin. The requirements of the Wisconsin code and the standards adopted in the code are sufficiently different to require a separate certification.

KEEP A COPY OF THIS INTERIM CERTIFICATION WITH YOU WHILE YOU ARE WORKING ON TANK JOBS IN WISCONSIN.

Questions regarding the certification process may be addressed to:

Ms. Luann Robb
Bureau of Petroleum Inspection and Fire Protection
P.O. Box 7969
Madison, WI 53707

A check in a checkbox indicates a positive or "yes" response

Site #4
Former Jones Mobil Station #05
4230 W. Good Hope Road
W. Good Hope Rd: STA 193+90 to 196+85 LT
N. 43rd Street : STA 00+80 to 3+00 RT

The site is identified on the AST, UST, LUST (#03-41-001664), EDR Historical Auto, SHWIMS, RCRA NonGen, FINDS database. Based on field reconnaissance, the site is currently occupied by a Mobil gas station. Review of the Milwaukee County GIS & Land Information Interactive Map online indicates the site is owned by GH JONES HOLDINGS, LLC [Ref.1].

According to the Wisconsin Department of Agriculture, Trade and Consumer Protection (DATCP) Storage Tank Database there are thirteen USTs and one AST registered to the site [Ref.2]. In May 1991, two one 500-gallon, two-2,000-gallon, and one 6,000-gallon leaded gasoline UST, one 5,000-gallon, one 8,000-gallon, and one 10,000-gallon unleaded gasoline UST, one 1,000-gallon fuel oil UST, and one 550-gallon waste / used motor oil UST were closed/ removed. In April 1997, one 1,000-gallon waste / used motor oil UST was closed / removed. One 500-gallon waste / used motor oil AST and one 8,000-gallon, one 10,000-gallon, and one 12,000-gallon unleaded gasoline USTs are currently 'In Use' at the site. The occupancy for all tanks is listed as 'retail fuel sales' [Ref.2].

According to the EDR report, no Sanborn Map coverage is available for the project corridor. The EDR Historical Auto database indicates that petroleum UST systems have been utilized on-site since at least 1969.

The SHWIMS database lists the site as an inactive, small quantity Hazardous Waste Generator of non-listed ignitable wastes. The wastes were most likely associated with the clean-up and removal of former UST systems at the site [Ref.3].

Himalayan's review of historical aerial photographs indicates the site was vacant lot until the 1960s. By the 1963, a parking lot and commercial building were developed in the northeast corner of W. Good Hope Road and N. 43rd Street. A canopy and pump islands were also present, indicating that the site has been a gasoline service station for over 50 years.

BRRTS #03-41-001664: In February 1991, the site owner received a notification of hazardous substances discharged at the site [Ref. 4]. Based on a report by Warzyn, Inc. (Warzyn), thirteen borings (B1 to B13) were advanced at the site in April and May 1991 with a maximum depth of 15 ft bgs. Six borings were converted to groundwater monitoring wells (MW1-MW6). Soil samples were analyzed for total petroleum hydrocarbons (TPH) and groundwater was analyzed for BETX and MBTE [Ref.5].

Based on Warzyn's inspection of tank removal / installation activities at the site in May and July 1991, approximately 1,670 cubic yards of impacted soil were removed from the former/current

UST locations and transported off-site to a sanitary landfill. Prior to installing up-dated UST systems and backfilling with clean material, 34 confirmation soil samples (CE series, waste/fuel oil) were collected from the bottom and sidewalls of the excavations at depths ranging from 5 to 12 feet bgs [Ref. 5]. All confirmation samples were analyzed for TPH. A combination groundwater recovery/soil vapor extraction system was installed at site in 1991 and operated periodically until 1998.

According to Warzyn, most of the contaminated soil was removed from the site except for areas adjacent to existing utilities and canopy footings. Following fifteen groundwater sampling events between 1991 and 1998 Warzyn also concluded that groundwater impacts along the south side of the site still exceeded NR140 ES standards, but the potential for significant lateral migration of the contaminant plume appears low. The activity was conditionally closed by the Wisconsin Department of Commerce in January 1999, with on-site residual soil contamination and groundwater use restriction [Ref.5].

Geology / Hydrogeology

Based on Warzyn's report, soils at the site consisted of fill material (mainly clayey sand and gravel) from the ground surface to 8 feet bgs. The fill material was underlain by inconsistent seams of native brown sand and silty clay with shallow perched groundwater at 5 to 8 feet bgs flowing south - southwest toward the W. Good Hope Road and N. 43rd Street [Ref.5].

Based on the USDA NRCS soil survey report, soils along the site consist of Clayey land (Cv). Clayey land is generally described as areas where development activities have either covered over or removed the original solum of the soil, therefore, native soil conditions are no longer present within the project corridor. This soil type is described as moderately well drained and the depth to groundwater is generally about 12 to 80 inches bgs. [Ref.6]

Soil Impacts

According to Warzyn's initial site investigation and tank closure inspection, most of the impacted soil was removed off-site during the tank removal / installation activities at the site in May and July 1991. However, lab results indicate that soil contamination may still be present along the south side of the property and north side of the current service station building. WOW1 at 7 feet bgs behind the building had TPH (2,050 mg/kg) and several soil samples near the W. Good Hope Road sidewalk (B10, CE41, CE101, CE103, CE104) at 1 to 6 feet bgs had TPH concentrations ranging from 83.1 to 1,230 mg/kg [Ref.5]

It appears that residual soil contamination is within the current W. Good Hope Road right of way and possibly underneath the roadway.

Groundwater Impacts

Based on the most recent groundwater sampling event in August 1998, several PVOCs were detected in MW-2 and MW-3. Benzene concentrations in MW-2 and MW-3 (0.85 to 1.2 µg/L) and MTBE in MW-3 (30 µg/L) exceeded NR 140 PAL. No other PVOCs were detected in concentrations exceeding their respective NR 140 ES or PAL. [Ref.5]

It appears that the groundwater contaminant plume may still be present within the current W. Good Hope Road right of way and possibly underneath the roadway.

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site.

Recommendations

Considering that the property has been used as a filling station for over 50 years and residual soil and groundwater contamination was detected at 1 to 8 feet bgs within the current W. Good Hope Road right of way, this site has the potential to impact some proposed improvements. Therefore, further investigation is recommended for the site.

The need for further investigation could be re-evaluated once construction and/or real estate requirements have been finalized.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

FID 241417110
BRRTS 0341001664

Subject: Closure request for Mobil Oil Stn. #05-EQG located at 4320 W. Good Hope Rd., Milwaukee, WI

Dear Mr. Holland:

The Department has reviewed the latest closure submittal, dated October 15, 1998, for the above mentioned site and any additional information pertaining to the most recent request for site closure. The Department concurs with your consultant that no further action is necessary at this time.

Based on the information contained in the report mentioned above, it appears that the above-named site has Benzene NR 140, Wis. Adm. Code (WAC), Preventative Action Limit (PAL) exceedances in MW-2 (1.2 ppb) and MW-3 (.85 ppb) and a MTBE PAL exceedance in MW-3 (30 ppb). The Department is issuing PAL exemptions per NR140.28 (2), WAC, for Benzene in MW-2 and MW-3 and MTBE in MW-3 at the above named site. This case will be considered closed after ch. NR 726.05(8)(c), Wis. Adm. Code (WAC), regarding monitoring well abandonment, is met. All Monitoring wells must be abandoned within 60 days in accordance to ch. NR 141.25, WAC. After receipt of monitoring well abandonment documentation, this site will be in compliance with ch. NR 726, WAC, and will be considered closed and tracked as such on the Department's tracking system.

However, the case may be reopened pursuant to s. NR 726.09, Wis. Adm. Code, if additional information regarding site conditions indicates that contamination on or from the site poses a threat to public health, safety or welfare of the environment.

For expedient processing, please send all future correspondence to the attention of Mike Farley-RR Program Assistant at the above address. Please include that I, Michelle McGee, am the current reviewer of the case.

If you have any questions or comments please contact me at the above address or at (414)263-8644.

Sincerely,
Michelle M. McGee

Re: Site Closure Request
Former Mobil Oil Station 05-EQG
4230 West Good Hope Road
Milwaukee, Wisconsin

Dear Mr. Farley:

This letter presents the site history and closure justification for the Good Hope Service Station (Former Mobil Oil Station 05-EQG) located at 4230 West Good Hope Road, Milwaukee, Wisconsin. The attached closure application, tables, and figures provide the information required by the Wisconsin Department of Natural Resources (WDNR) for case closure pursuant to Chapter 292 of the Wisconsin Statutes and Chapter NR 726 of the Wisconsin Administrative code.

Site Location & Description

Good Hope Service is located in the SW ¼, SW ¼, Section 13 Township 8 North, Range 21 East, City of Milwaukee, Milwaukee County, Wisconsin. The site is approximately 2/5-acres in size and is bordered by North 43rd Street to the west, Good Hope Road to the South, a private residence to the east, and a former diner to the north. The site is serviced by municipal water and sanitary sewer.

Prior to June 1991, the station included one 4,000-gallon gasoline tank, one 8,000-gallon gasoline tank, one 10,000-gallon gasoline tank, one 1,000-gallon fuel oil tank, and one 1,000-gallon waste oil tank. Additionally, four UST's not previously known to exists on the site were found during construction activities. A pump island was formerly present west of the building, but was removed in 1978.

Currently the site is an operating service station with two 10,000-gallon, one 12,000-gallon unleaded gasoline tanks, and one 1,000-gallon waste oil tank. The service station building is

located in the north-central part of the site. The site is primarily covered with concrete on the western half of the property and asphalt on the eastern half of the property.

Generally, the site slopes to the south. On the eastern border of the site is an abrupt 3-feet drop to the adjacent property to the east. The area in the immediate vicinity of the site is developed both commercially and residentially. North of the site is a former diner. Tripoli County Club is located immediately across North 43rd Street to the West. Tolkan Leasing company occupies the southwest corner of the intersection of West Good Hope Road and North 43rd Street. On the southeast corner of the intersection of North 43rd Street and West Good Hope Road is the former Petro Pantry Service station.

Regional Geology and Hydrogeology

The site is situated on gently sloping glacial ground moraine deposits at an elevation of 710 feet (USGS Datum). The site is approximately 20 feet higher than an unnamed tributary stream to the Milwaukee Rive located in Brown Deer Park, approximately ¾-mile to the east. Surface topography in the site vicinity site slopes gently (1 to 2 percent) to the southeast.

The surficial glacial deposits consist primarily of silt and clay with some interbedded sand. These deposits are approximately 50 to 70 feet thick in the site vicinity and overlie dolomite bedrock. Depth to shallow groundwater appears to range between 6 to 10 feet based on monitoring information from the site. Regional water table maps indicate the water table elevation is at approximately 670feet (approximately 40 feet below ground surface (BGS)); however, the regional map is based primarily on water levels measured in wells completed in the dolomite bedrock and is not necessarily representative of water levels in the shallow fine-grained sediments.

Well Contractor's Reports for the eleven private wells in the vicinity of the site were obtained from files of the WDNR – Southeast District, Water Supply Section. The wells were constructed between 1939 and 1958, and can no longer be used for potable household purposes but may be used for irrigation. Tripoli Country Club currently uses their well for irrigation. The wells ranged in depth form 64 to 108 feet and, except for one, are cased through the unconsolidated sediments and completed as open holes in the dolomite aquifer. The other well, which is cased to a depth of 64 feet, apparently is completed as an open-end well (i.e., no screen) in gravel. Depth to bedrock ranges between 38 and 94 feet in these wells; bedrock depth for two wells closest to the site is both 67 feet. Water levels range from 23 to 40 feet in depth near the site.

Site Geology and Hydrogeology

Most of the site is covered by asphalt or concrete, which is underlain by a course sand and gravel base to an approximate depth of 1-foot BGS. Underlying the base is a silty clay fill ranging in depth from 3 feet BGS at the property boundaries to the south and southwestern to 10.5 ft BGS in the vicinity of the UST's.

Underlying the fill to the maximum depths explored (13 to 15 feet BGS) is interbedded brown silty clay, sandy and clayey silt, fine to medium sand, and some gravel. The brown silty clay immediately underlies the fill generally in the vicinity of the former and new UST's and the pump islands. In boring B2, the fill was immediately underlain by sand, which may have been part of the UST backfill material. Sandy silt, sand, and gravel generally underlies the fill in the northwest, southwest, and eastern parts of the site.

Depth to the groundwater at the site is generally from 5 to 7 feet BGS. Groundwater flow at the site generally appears to be to the south and the southeast toward Good Hope Road.

Site History

On February 4, 1991 after noting water in a gasoline underground storage tank (UST) onsite the facility owners reported a possible release to the Wisconsin department of Natural Resources (WDNR). In a letter dated July 8, 1991 the WDNR requested, that Good Hope Mobil initiate an investigation to determine the extent of possible contamination onsite and provide recommendations for remediation, if warranted.

Between April 11 and May 6, 1991 thirteen soil borings (B1, B2, B3/MW2, B4-B8, B9/MW5, B10/MW1, MW3, and MW6) were drilled onsite to depths from 10.5 to 15 feet BGS. Soil borings B1 through B11 were advanced with 2 ¼-inch inside diameter (ID) hollow-stem augers (HSA) using a truck mounted rotary drill rig. Borings B3, B9, B10, and B11 were later redrilled with 4 ¼-inch ID HSA and advanced to 14.5 feet BGS for the installation of monitoring wells MW2, MW5, MW4, and MW1, respectively. Monitoring wells MW3 and MW6 were drilled to 14.5 feet BGS with 4 ½-inch ID HSA. Standard Penetration Tests (SPTs) were conducted according to ASTM Method D1586 and pocket penetrometer measurements (qu) were recorded for all cohesive soil samples. Soils were visually classified using the Unified Soil classification System (USCS).

Monitoring wells MW1 through MW6 were constructed with 2 inch inside diameter, Schedule 40, flush-joint, threaded PVC casing and screen. Screen lengths varied from 10.15 to 10.30 feet with a slot size of 0.010-inch Monitoring wells MW1 through MW5 were completed with flush-mount protector and MW6 was completed with an aboveground protector.

Twenty-five soil samples were collected from the borings and were analyzed for total petroleum hydrocarbons (TPH). Three of these samples (B1S1, B6S3, and B7S2 were also analyzed for benzene, ethylbenzene, toluene, and xylenes (BETX). A composite sample was also prepared and analyzed for waste characterization parameters required by Waste Management of Wisconsin (WMWI) for disposal at Parkview Landfill.

Fifteen groundwater-sampling events were conducted at the site from May 26, 1991 to August 26, 1998. This includes one round of groundwater sampling (April 26, 1991) prior to implementation of the remedial alternative.

On May 9, 1991 the soil boring and monitoring well locations and elevations were initially surveyed by earth Tech Services. Upon completion of the site construction activities the monitoring well elevations and new site features were resurveyed on August 19, 1991. Elevations for the tops of PVC casing ere measure to the nearest 0.01-feet and ground elevations were measured to the nearest 0.1-feet. The site elevation benchmark is based on the U.S. Geological Survey datum and is located on the northwest flange bolt of a hydrant located on the southwest corner of the site. The benchmark elevation is 713.24. Soil boring and monitoring well locations, as well as other site features were located on a grid and measured to the nearest 0.01 feet.

HANDEX®

Remediation Activities

From May 13 to May 15, 1991 Interstate Pump and Tank, Inc. (Interstate) removed seven gasoline USTs, one fuel oil UST, and one waste oil UST from the site. One 8,000-gallon and one 10,000-gallon gasoline UST and one 550-gallon waste oil UST were in service at the time of removal. A 4,000-gallon gasoline UST was not in service at this time due to the presence of water in the tank. The 1,000-gallon fuel oil UST was also not in service because the station had been previously converted to natural gas. During removal activities two additional 2000-gallon, one 6,000-gallon and one 550-gallon USTs were discovered and removed.

From May 15 to June 13, 1991 Interstate excavated and disposal of approximately 1,500 cubic yards of impacted soil. During soil removal, visual, olfactory, and field PID screening of the soil excavation was conducted. A minimum of one sample for every 15 cu yd. of contaminated soil excavated was collected for PID headspace screening, per WDNR requirements. The soil excavation consisted of soil removal from five separate locations at the site with a combined area of approximately 40,200 cubic feet.

Upon completion of the initial excavation activities a total of thirteen-soil conformation samples were collected from the excavation sidewalls and floor on a 25-ft grid interval. The samples were collected from areas with elevated PID readings within the grid system. Samples were placed in 4-ounce, Teflon capped glass jars and cooled to 4 C. The samples were then transported under chain-of-custody procedures to Warzen's analytical laboratories in Madison, Wisconsin. TPH analysis was conducted using ASTM Method D3325 (with modification) and U.S. EPA Method SW846-3350 for extraction.

Soil conformation analytical results from several floor and sidewall samples (CE88, CE89, CE90, CE94, CE103, WOW, & CE104) indicated that impacted soils remained on site after completion of the initial excavation activities. On May 29 and June 25, 1991 an additional 120 cubic yards of soil was over excavated and disposed of. Soil was removed from each area until no staining, odors, or elevated PID readings were noted. Upon completion of the over excavation five conformation soil samples (WF-E, WF-S, WF-W, WF-N, & WOBA) were collected and submitted for laboratory analysis. Based on the analytical results of the conformation samples, no additional soil removal activities were conducted.

On May 23, 1991 a 6 inch diameter, galvanized steel, combination groundwater recovery/soil vapor extraction well (RW1) was installed. The screen length was 10.3 feet. The excavation extended to more than 16 feet below grade, with the bottom of the well screen set at 16 ft. Pea gravel was backfilled to the top of the screen. Holes were drilled and a Monitor Brassy pitless adapter and a JCM Service Saddle were bolted to the well casing at depths of approximately 5.5 and 15 feet BGS, respectively. One-in. diameter SDR9 polyethylene piping was attached to the pitless adapter with compression fittings and placed in a 5 ½ feet deep trench excavated to the west and north of the station and temporarily stubbed out at the proposed location of the potential remediation building on the north side of the station. Two-in. diameter SDR9 polyethylene was attached to the saddle with pressure fittings and placed in the same trench backfilled at a depth of 3 feet. Three quarter in. electrical conduit and ½-inch copper tubing were also placed in this trench and stubbed out at the same depth as the 1-inch polyethylene. RW1 has never been utilized for anything other than the collection of groundwater elevation and analytical data.

Conclusion

Based on the analytical data collected during the soil excavation and the improvement in groundwater quality over the past several years, Handex recommends that the site be closed with no restriction in accordance with NR 726.05(8)(am). Although the site has a PAL exceedance for benzene in MW-2 and MW-3 and for MTBE in MW-3, groundwater quality has improved significantly since 1991. In addition, natural attenuation is occurring at the site and will continue to reduce contaminant concentrations in the soil and groundwater.

After receiving a closure letter from the WDNR, the monitoring wells will be abandoned in compliance with Chapter NR141, and abandonment forms will be submitted to the WDNR along with any necessary deed forms.

If you have any questions or need any additional information please feel free to contact me at (414) 641-9011 at any time.

Sincerely,

HANDEX

Notes:

A) Sample contained what apperaed to be a hydrocarbon fraction eluting off of the gas chromatograph with a retention time in the range of Kerosene. This unknown does not match any reference standards. An estimated concentration of the unknown calculated against a Kerosene reference standard is 9.24 mg/kg.

B) Sample contained what apperaed to be a hydrocarbon fraction eluting off of the gas chromatograph with a retention time in the range of #2 Fuel Oil. This unknown does not match any reference standards. An estimated concentration of the unknown calculated against a #2 Fuel Oil reference standard is 9.50 mg/kg.

C) Sample contained what apperaed to be a hydrocarbon fraction eluting off of the gas chromatograph with a retention time in the range of Gasoline. This unknown does not match any reference standards. An estimated concentration of the unknown calculated against a Gasoline reference standard is 18.8 mg/kg.

D) Sample contained what apperaed to be a hydrocarbon fraction eluting off of the gas chromatograph with a retention time in the range of #6 Fuel Oil. This unknown does not match any reference standards. An estimated concentration was calculated against a #6 Fuel Oil reference standard.

1) Results are in Micrograms per kilogram (mg/kg) / parts per million (ppm).

2) The average depth to groundwater is 6 feet below ground surface (BGS).

REPLY MESSAGE
FORM AD-16

INSTRUCTIONS TO SENDER:
REMOVE YELLOW COPY FOR YOUR FILE.
SEND REMAINDER OF FORM INTACT WITH CARBONS TO PERSON ADDRESSED.

TO: John Feeney, SED

FROM: Lanie Ege, SW/3

SUBJECT–MESSAGE

Hi John, Dennis Lawton of Warzyn called me re. your Mobil site on Brown Deer Rd. His question was whether the NR 140 exceedences require an active groundwater remediation system. He described the areal extent of contamination as quite small. I responded that if they have done a good job controlling the source of contamination, and if the spread of groundwater impact seemed unlikely we could consider a long term groundwater monitoring proposal instead of pump + treat. I suggested he evaluate what else could be done to remediate the soil under the pump islands, and to calculate long term impacts on groundwater (dissipation, bioremediation etc.) and get you a specific proposal. Also told him the key is good source control (soil), and the decision is up to you. I wanted to let you know I don't have a problem with his proposal as long as he gets you the info you need to evaluate it, and assuming the general info he gave me on the site is accurate. Call if you have questions. Lanie

Re: PECFA Form 4
Good Hope Service
4230 West Good Hope Road
Milwaukee, Wisconsin

Dear Mr. Feeney:

On behalf of Good Hope Service (S.J. & J.W. Inc.), please find enclosed for your execution the PECFA Form 4 for the referenced site. This form was not included with the Site Investigation Report that was transmitted to you on September 13, 1991. Please note that the enclosed Form 4 is for activities related to gasoline underground storage tanks (USTs) at the site. S.J. & J.W., Inc. will be making a separate PECFA claim for investigation and remediation activities related to the waste oil UST. The PECFA Form 4 for this claim will be forwarded to you for execution in the near future.

If you have any questions regarding the Site Investigation Report or activities performed at the site, please contact us.

Sincerely,

WARZYN INC.

Dennis R. Lawton, CPG

SECTION 1
INTRODUCTION

This report presents the results of a site investigation performed by Warzyn Inc. (Warzyn) for S.J. & J.W., Inc. at Good Hope Service located at 4230 West Good Hope Road, Milwaukee, Wisconsin. The purpose of the investigation was to evaluate the extent and magnitude of potential petroleum hydrocarbon contamination in soil and groundwater on the site. The facility owners reported a possible release to the Wisconsin Department of Natural Resources (WDNR) on February 4, 1991 after noting water in a gasoline underground storage tank (UST) onsite. Subsequently the WDNR requested, in a letter dated July 8, 1991, that Good Hope Mobil initiate an investigation to determine the extent of possible contamination onsite and provide recommendations for remediation, if warranted.

This report also presents the results of initial site remediation activities that were performed concurrently with UST and dispenser island replacement activities. The field investigation activities were performed in April and May 1991 and initial remediation activities were performed from May to July 1991.

The site investigation included the following tasks:

- Performance of thirteen soil borings and installation of six groundwater monitoring wells.
- Analysis of twenty-five soil samples from the borings for total petroleum hydrocarbons (TPH), three of which were also analyzed for benzene, ethylbenzene, toluene, and xylenes (BETX).
- Collection and analysis of two sets of groundwater samples from the monitoring wells for BETX and methyl tert-butyl ether (MTBE).

The initial site remediation activities included the following:

- Removal and disposal of seven gasoline USTs, one fuel oil UST, one waste oil UST, and associated contaminated soils.
- Coordinating transportation and disposal of petroleum-contaminated soil at Waste Management of Wisconsin's (WMWI) Parkview Landfill.

- Analysis for TPH of 34 confirmatory soil samples collected from the walls and floors of remedial excavations onsite.

- Installation of one combination groundwater recovery/soil vapor extraction well.

SECTION 2
SITE DESCRIPTION

Good Hope Service is located in the SW 1/4, SW 1/4, Section 13, Township 8 North, Range 21 East, City of Milwaukee, Milwaukee County, Wisconsin (Figure 1). The site is approximately 2/5-acre in size and is bordered by North 43rd Street to the west, Good Hope Road to the south, a private residence to the east, and a former diner to the north (Figure 2). The site is serviced by municipal water and sanitary sewer.

The site is an operating service station with two new pump islands, two new 10,000-gallon and one new 12,000-gallon unleaded gasoline tanks, and one new 1,000-gallon waste oil tank. The service station building is located in the north-central part of the site. New concrete covers most of the western one half of the site and asphalt (southeast) and sand and gravel cover the remainder of the site (Figure 3).

new tanks installed

Prior to June 1991, the station included one 4,000-gallon gasoline tank, one 8,000-gallon gasoline tank, one 10,000-gallon gasoline tank, one 1,000-gallon fuel oil tank, and one 1,000-gallon waste oil tank (Figure 4). Additionally, four USTs not previously known to exist on the site were found during construction activities. A pump island was formerly present west of the building, but was removed in 1978.

Generally, the site slopes to the south. On the eastern border of the site is an abrupt 3 ft drop to the adjacent property to the east. The area in the immediate vicinity of the site is developed both commercially and residentially (Figure 2). North of the site is a former diner. Tripoli County Club is located immediately across North 43rd Street to the west. The southwest corner of the intersection of West Good Hope Road and North 43rd Street is occupied by Tolkan Leasing Company, but appears to formerly have been a service station. On the southeast corner of the intersection of North 43rd Street and West Good Hope Road is the former Petro Pantry Service station, which is presently being remediated for petroleum-contamination.

drainage system for gw.

SECTION 3
REGIONAL HYDROGEOLOGY AND GROUNDWATER USE

The site is situated on gently sloping glacial ground moraine deposits at an elevation of 710 ft (USGS Datum). The site is approximately 20 ft higher than an unnamed tributary stream to the Milwaukee River located in Brown Deer Park, approximately 3/4-mile to the east. Surface topography in the site vicinity site slopes gently (1 to 2 percent) to the southeast.

The surficial glacial deposits consist primarily of silt and clay with some interbedded sand. These deposits are approximately 50 to 70 ft thick in the site vicinity and overlie dolomite bedrock. Depth to shallow groundwater appears to range between 6 to 10 ft based on monitoring well information for the Petro Pantry site to the south. Regional water table maps indicate the water table elevation is at approximately 670 ft (approximately 40 ft below ground surface); however, the regional map is based primarily on water levels measured in wells completed in the dolomite bedrock and is not necessarily representative of water levels in the shallow fine-grained sediments.

Well Constructor's Reports for eleven private wells in the vicinity of the site were obtained from files of the WDNR - Southeast District, Water Supply Section (Appendix A). The wells were constructed between 1939 and 1958, and can no longer be used for potable household purposes but may be used for irrigation. Tripoli Country Club currently uses their well for irrigation. The wells ranged in depth from 64 to 108 ft and, except for one, are cased through the unconsolidated sediments and completed as open holes in the dolomite aquifer. The other well, which is cased to a depth of 64 ft, apparently is completed as an open-end well (i.e., no screen) in gravel. Depth to bedrock ranges between 38 and 94 ft in these wells; bedrock depth for two wells closest to the site are both 67 ft (wells 2 and 8). Water levels range from 23 to 40 ft in depth near the site.

SECTION 4
INVESTIGATION ACTIVITIES

Soil Borings

Between April 11 and May 6, 1991 thirteen soil borings (B1, B2, B3/MW2, B4-B8, B9/MW5, B10/MW4, B11/MW1, MW3, and MW6) were drilled onsite to depths from 10.5 to 15 ft. Soil boring and monitoring well locations are presented on Figure 3. Boring logs and borehole abandonment forms are presented in Appendix B and monitoring well construction and development forms are presented in Appendix C. Monitoring well construction information is summarized in Table 1.

Soil borings B1 through B11 were advanced with 2 1/4-in. inside diameter (ID) hollow-stem augers (HSA) using a truck-mounted rotary drill rig. Borings B3, B9, B10, and B11 were later redrilled with 4 1/4-in. ID HSA and advanced to 14.5 ft for the instrumentation of monitoring wells MW2, MW5, MW4, and MW1, respectively. Monitoring wells MW3 and MW6 were drilled to 14.5 ft with 4 1/2-in. ID HSA. Standard Penetration Tests (SPTs) were conducted according to ASTM Method D1586 and pocket penetrometer measurements (qu) were recorded for all cohesive soil samples. Soils were visually classified by a Warzyn geologist using the Unified Soil Classification System (USCS). Soil samples were collected in both 4-ounce, teflon-capped glass jars and 8-ounce glass sample jars. The 4-ounce jars were cooled to 4°C for possible laboratory analysis.

Soil samples were field screened using a photoionization detector (PID) immediately after the sampler was opened. Headspace PID readings were later measured after warming the samples (8-ounce jars) to 70°F. The sample jars used for headspace readings were covered with aluminum foil prior to capping. The PID used was an HNU Systems, Inc., Model PI101, Trace Gas Analyzer with a 10.2 eV lamp and calibrated to benzene using isobutylene. Field and headspace PID readings are included on the boring logs in Appendix B and are summarized in Table 2.

The split-spoon sampler and other sampling equipment were decontaminated between samples with a trisodium phosphate (TSP) wash followed by a potable water rinse. The hollow-stem augers and associated drilling equipment were steam-cleaned between borings.

Monitoring Well Installation

Monitoring wells MW1 through MW6 were constructed with 2-in. inside diameter, schedule 40, flush-joint, threaded PVC casing and screen. Screen lengths varied from 10.15 to 10.30 ft with a slot size of 0.010 in. Monitoring wells MW1 through MW5 were completed with flush-mount protectors and MW6 was completed with an aboveground protector. A verbal variance from NR 141 requirements for installation of these monitoring wells was obtained from John Feeney of the Wisconsin Department of Natural Resources (WDNR). A follow-up letter was sent to the WDNR on July 19, 1991 outlining the flush-with-grade monitoring well installations (Appendix C). After completion, all wells were developed as described on the Monitoring Well Development Forms in Appendix C. Monitoring well MW5 was completely removed on May 15, 1991 during site excavation activities.

Soil Analyses

Twenty five soil samples collected from the borings were analyzed for total petroleum hydrocarbons (TPH). Three of these samples (B1S1, B6S3, and B7S2) representative of the most highly contaminated soils onsite were also analyzed for benzene, ethylbenzene, toluene, and xylenes (BETX), then composited and analyzed for other waste characterization parameters required by Waste Management of Wisconsin (WMWI) for disposal at Parkview Landfill. The permitting paperwork and laboratory analysis for waste characterization are included in Appendix D.

Samples with high PID readings were selected for analysis to evaluate the maximum concentrations of contamination in onsite soils; samples with nondetectable or low PID readings were selected for analysis to delineate the horizontal and vertical boundaries of affected soils. The samples were stored on ice and transported under chain-of-custody procedures to Warzyn's analytical laboratory in Madison, Wisconsin. BETX analyses were conducted using U.S. EPA Method SW8020 and TPH analyses were conducted using ASTM Method D3328 (with modifications) and U.S. EPA Method SW846-3350 for extraction. Analytical results are included in Appendix E and are summarized in Table 3.

Water Level Measurements

Water levels were measured on May 8, May 10, June 11, and August 14, 1991 using an electric water level indicator. Water level measurements are summarized in Table 4.

Groundwater Sampling

Monitoring wells were sampled on two occasions (April 26/May 8, 1991 and June 11, 1991) for laboratory analysis of BETX and MBTE. Analytical Results are included in Appendix F and summarized in Table 5.

All wells were bailed dry prior to sampling. The wells were sampled with a bottom-filling stainless-steel bailer, which was decontaminated between wells with a TSP wash and a triple deionized-water rinse. Included with the samples was a trip blank, field blank, and duplicate, for QA/QC purposes. Samples were packed on ice and shipped under chain-of-custody procedures to Warzyn's analytical laboratory in Madison, Wisconsin for analysis. Analyses were performed using U.S. EPA Method 602.

Location and Elevation Survey

Soil boring and monitoring well locations and elevations were initially surveyed on May 9, 1991 by Earth Tech Services. Monitoring well elevations and new site features were resurveyed on August 19, 1991, after completion of site construction activities. Elevations for the tops of PVC casing were measured to the nearest 0.01 ft and ground elevations were measured to the nearest 0.1 ft. The site elevation benchmark is based on the U.S. Geological Survey datum and is located on the northwest flange bolt of a hydrant located on the southwest corner of the site. The benchmark elevation is 713.24. Soil boring and monitoring well locations, as well as other site features shown on Figure 5, were located on a grid and measured to the nearest 0.01 ft.

SECTION 5
INVESTIGATION RESULTS

Site Physical Characteristics

Site Geology and Soils

The generalized site geology is illustrated on cross-section A-A′ (Figure 5) and the boring logs in Appendix B. Most of the site is covered by asphalt or concrete, which is underlain by sand and gravel base course to an approximate depth of 1 ft. Underlying the base course is sandy and silty clay fill, ranging in depth from 3 ft at the property boundaries in the south and southwestern parts of the site to 10.5 ft or greater in the vicinity of the USTs. A 4-inch thick buried concrete slab was encountered at a depth of about 1 ft between the existing pump islands.

Underlying the fill to the maximum depths drilled of 13 to 15 ft is interbedded brown silty clay, sandy and clayey silt, fine to medium sand, and some gravel. The brown silty clay immediately underlies the fill generally in the vicinity of the former and new USTs and the pump islands (B1, B4, B5, B6 and B8). In boring B2, the fill was immediately underlain by sand, which may have been part of the UST backfill material. Sandy silt, sand, and gravel generally underlies the fill in the northwest (B7 and B11), southwest (B9 and B10) and eastern (MW3 and MW6) parts of the site.

Site Hydrogeology

Depth to groundwater in site monitoring wells is generally from 5 to 7 ft below ground surface (Table 4). A water table contour map based on water levels measured on May 10, 1991 is presented in Figure 6. Groundwater flow generally appears to be to the south and southeast toward Good Hope Road.

toward Petro Pantry site

Nature and Extent of Contamination

Soils

The extent of soil contamination onsite is generally illustrated on Figure 7, which includes field and headspace PID readings, and TPH and BETX analytical results. PID readings are summarized in Table 2 and TPH and BETX analyses in Table 3.

Soil contamination onsite is generally limited to the former UST areas, a former pump island area, and the existing pump island area. In the former UST area, contamination extended to depths up to 12 ft. Within this area, headspace PID readings were as great as 300 PID units as demonstrated in readings E-1 through E-6 (Appendix G). Soil borings B1 and B6 were completed within this area and represent examples of the greatest concentrations of TPH and total BETX. A sample from B1 had a TPH concentration of 3190 mg/kg in the range of gasoline and total BETX of 192 mg/kg. Boring B6 had a TPH concentration of 2420 mg/kg in the range of #2 fuel oil and total BETX of 3.69 mg/kg.

In the vicinity of the former pump island on the west side of the site, soil contamination extended from the surface to a depth of approximately 5 ft. Headspace PID readings ranged from approximately 100 to 150 PID units, as demonstrated in readings E66 through E69 (Appendix G). A sample from 3.5 to 5.5 ft in depth had a TPH concentration of 13 mg/kg in the range of gasoline and total BETX concentration of 5.01 mg/kg.

Between the pump islands on the south side of the site, soil contamination extended to depths greater than 10 ft. Headspace PID readings as great as 300 PID units were measured in this area as shown in readings E78 through E93 (Appendix G). Although no borings were drilled within this area, one sample from beneath the pump island analyzed for TPH had a concentration of 2670 mg/kg in the range of gasoline. Soil contamination south of the pump islands was limited to a depth of approximately 4 ft. No borings were drilled within the bounds of this contaminated area; however, sample CE103 (headspace reading of 140 PID units) collected from the wall of the excavation had a TPH concentration of 228 mg/kg in the range of gasoline. The majority of contaminated soil was removed from these areas.

PID readings in borings within 10 ft of these excavations (B4, B5, B11, and MW3) indicates soil contamination is minimal and within the zone of water table fluctuation in other limited areas of the site.

Groundwater

Results of BETX and MTBE analyses for water samples collected from onsite monitoring wells are summarized on Table 5 and illustrated on Figure 8. Benzene concentrations exceeding State of Wisconsin Groundwater Quality Standard Preventive Action Limits (PALs) are present in monitoring wells MW1, MW2, MW3, MW5, and MW6; however, the Enforcement Standard was exceeded only in wells MW2 and MW3. Ethylbenzene, toluene, and xylenes were detected in wells MW1 through MW3 at concentrations below the PALs and only toluene was detected below the PAL in well MW5. Methyl tert-butyl ether (MTBE) was detected in wells MW2 through MW4 and MW6.

SECTION 6
SITE REMEDIATION ACTIVITIES

UST Removal and Abandonment

From May 13 to June 3, 1991 Interstate Pump and Tank, Inc. (Interstate) removed seven gasoline USTs, one fuel oil UST, and one waste oil UST. Locations are presented in Figure 4 along with respective reference numbers was listed below. A Warzyn representative was present during removal. Mr. Timothy J. Temperly, City of Milwaukee Building Inspector for Flammable and Combustible Liquids, was present for removal of some of the tanks. One 8,000-gallon (8) and one 10,000-gallon (9) gasoline UST and one 550-gallon waste oil UST (2) were in service at the time of removal. A 4,000-gallon gasoline UST (7) was not in service at this time due to the presence of water in the tank. The 1,000-gallon fuel oil UST (1) was also not in service because the station had been previously converted to natural gas. During removal of the known USTs, two additional 2,000-gallon (5&6), one 6,000-gallon (4) and one 550-gallon (3)gasoline USTs were discovered and removed. The USTs were all steel and their condition at the time of the removal was as follows:

(1) 1,000-gallon fuel oil - no evidence of leaks.
(2) 550-gallon waste oil - no evidence of leaks.
(3) 550-gallon abandoned gasoline - hole in one end, capped, some old gasoline.
(4) 6,000-gallon abandoned gasoline - no holes, full of water.
(5) 2,000-gallon abandoned gasoline (northern) - some holes, capped, partly filled with water.
(6) 2,000-gallon abandoned gasoline (southern) - numerous holes, capped, partly filled with water.
(7) 4,000-gallon gasoline - hole in bottom of tank.
(8) 8,000-gallon gasoline - was very pitted on the outside but no holes.
(9) 10,000-gallon gasoline - no holes or pitting epoxy coming off inside.

Those tanks containing liquid at the time of discovery were pumped by National Tank Service of Wisconsin, Inc. (National Tank). All USTs were cleaned by National Tank prior to removal from the site for disposal. Sludge removed from the USTs were placed in 55-gallon drums and are stored onsite awaiting a U.S. EPA disposal number for disposal.

Underground Petroleum Product Tank Inventory forms indicating abandonment of all nine USTs are in Appendix H.

Contaminated Soil Removal

Excavation of contaminated soil was conducted at five locations onsite. The areas are located on Figure 9 and are described as follows:

- The large former gasoline UST area - in the southwest quadrant of the site.
- Area ABCD - encompassing a former pump island west of the building.
- Area EFGH - between the two pump islands on the south side of the site.
- Area IJKL - south of the southern pump island.
- The waste oil/fuel oil UST excavation - north of the building.

A test pit was dug between the north pump island and the building to investigate for contaminated soils (Figure 9). Field PID readings were 10 PID units or less therefore, soils were not excavated from this area.

During removal, visual and olfactory observations, as well as field PID screening of the soil in the backhoe bucket was conducted. A minimum of one sample for every 15 cu yds of contaminated soil excavated was collected for PID headspace screening, per WDNR requirements. Documentation of PID readings is presented in Appendix G. Approximately 1,150 cu yds of gasoline-contaminated soil was disposed at Parkview during excavation activities. Five soil samples were analyzed for TPH and BETX, per WDNR requirements for completing the Application to Treat of Dispose of Petroleum-Contaminated Soil Form 4400-120 (Appendix D). the samples are B1S1, B6S3, B7S2, E-32, and E-34 and are summarized in Table 3.

After completion of soil excavation, the walls and floor of the excavations were field-screened and confirmatory samples were collected on a 25 ft grid interval and analyzed for TPH. Results of field-screening are presented in Appendix J. See Figure 10 for sample

locations. The samples were collected from areas that had the highest PID readings within the grid system. Samples were placed in 4-ounce, teflon-capped glass jars and cooled to 4°C. The samples were then transported under chain-of-custody procedures to Warzyn's analytical laboratory in Madison, Wisconsin. TPH analysis were conducted using ASTM Method D3325 (with modifications) and U.S. EPA Method SW846-3350 for extraction. Analytical results are summarized in Tables 6 and 7 and laboratory reports are included in Appendix K.

Large Former Gasoline UST Area

After UST removal, visual and olfactory observations, as well as PID screening of the floor and walls of the excavation indicated petroleum-contaminated soils were still present. Over-excavation of contaminated soils was initiated and the final excavation extended over an area of approximately 2,500 sq ft with depths up to 12 ft (Figure 10). A sidewalk limited the excavation to the south and pump islands limited the excavation to the east.

A total of eleven samples were collected from the floor and walls of the excavation and analyzed for TPH. Sample CE41-6' on the western half of the south wall at a 6 ft depth had a hydrocarbon fraction eluting off the gas chromatograph with a retention time in the range of gasoline. The estimated concentration was 83.1 mg/kg. TPH was nondetectable in all other samples.

Area ABCD

The area excavated around the former pump island is designated on Figure 9 by the letters A, B, C, and D. Soils were excavated both laterally and vertically from the pump island until highly contaminated soils were removed. The excavation dimensions were 15 ft by 15 ft and extended to a depth of 5 ft. Further excavation vertically was hampered by the presence of a water and sewer line extending across the excavation at a depth of 5.5 ft. Three confirmatory samples (CE73, CE74, and CE76) were collected from the sidewalls for laboratory analysis of TPH. Sample CE73 on the west wall of the excavation had estimated TPH concentrations with retention times in the ranges of kerosene and #2 fuel oil of 9.24 mg/kg and 9.50 mg/kg, respectively. Sample CE74 on the north wall of the excavation had

an estimated TPH concentration with a retention time in the range of gasoline of 18.74 mg/kg. Sample CE76 on the east wall of the excavation had nondetectable TPH. Sample B753, from boring B7, collected from 6 to 8 ft in depth within the limits of the excavation had nondetectable TPH (Table 3).

Area EFGH

The area excavated between the active pump islands is designated on Figure 9 by the letters E, F, G, and H. Contaminated soils in this area were discovered during removal of former product transfer lines. Soils were excavated laterally between the pump islands (north-south) and from the large excavation east until low PID readings were measured. The final excavation dimensions were 30 ft by 20 ft. Vertically, soils were excavated to a depth below which further excavation was considered to place the pump islands canopy footings could be placed in possible jeopardy (10 ft).

Lateral excavation to the south was limited by the canopy footings and associated pump island. Field PID readings ranged from 4 to 200 PID units. Sample CE90 (200 PID units) had a TPH concentration of 2670 mg/kg in the range of gasoline. This sample was collected from soils between the two footings for the southern pump island (south wall). These soils were later removed. Lateral excavation to the north was limited by canopy footings and the associated pump island. Field PID readings ranged from nondetectable to 110 PID units in gravel backfill around a 4-in. diameter drain tile extending into the excavation. Five confirmatory samples (CE88, CE89, CE90, CE94, and CE95) were collected from the sidewalls and floor for laboratory analysis of TPH. A confirmatory sample (CE94) from the gravel backfill had an estimated TPH concentration with a retention time in the range of kerosene of 1124 mg/kg. Excavation to the east was halted when PID readings were low. Field PID readings ranged from 2 to 10 PID units. A confirmatory sample (CE88) from this wall (east) had an estimated TPH concentration with a retention time in the range of kerosene of 138 mg/kg. As discussed previously, vertical excavation of soils was halted at 10 ft due to concern for the integrity of the canopy footings. Field PID readings at 10 ft ranged from 2 to 150 PID units. Two confirmatory

samples (CE89 and CE95) were collected at the locations of the two highest field PID readings. Sample CE89 had a TPH concentration in the range of gasoline of 481 mg/kg. TPH was nondetectable in sample CE95.

Area IJKL

The area excavated south of the southern pump island is designated on Figure 9 by letters I, J, K, and L. Soils were excavated laterally and vertically until most of the highly contaminated soils were removed. Final excavation dimensions were 30 ft by 10 ft and extended to a depth of 4 ft. Lateral excavation to the north was limited by the canopy footings and pump islands, although some limited excavation was conducted between the footings. Field PID readings ranged from 12 to 100 PID units. Five confirmatory samples (CE101, CE102, CE103, CE104, and CE105) were collected from the sidewalls and floor for laboratory analysis of TPH. The lateral extent of the excavation to the east, west, and south, and vertically was stopped when PID readings were significantly reduced, soil discoloration due to staining was nonexistent and odors were significantly reduced or not evident. Confirmatory samples were collected from each wall and floor at locations with the highest PID readings. Sample CE101 collected at the location of the 100 PID units reading on the north wall had an estimated TPH concentration with a retention time in the range of gasoline of 1230 mg/kg. The east wall had PID readings ranging from 1 to 70 PID units. Confirmatory sample CE104 had estimated TPH concentrations with retention times in the ranges of gasoline and #2 fuel oil of 93.9 mg/kg and 204 mg/kg, respectively. The readings for the west wall ranged from 2 to 40 PID units. Sample CE105 had a TPH concentration in the range of gasoline of 23.9 mg/kg. Field readings for the south wall ranged from nondetectable to 140 PID units. Confirmatory sample CE103 had an estimated TPH concentration with a retention time in the range of gasoline of 228 mg/kg. The floor of the excavation had PID readings ranging from 2.4 to 20 PID units. Sample CE102 had an estimated TPH concentration with a retention time in the range of gasoline of 14.2 mg/kg.

Waste and Fuel Oil USTs Area

After the fuel oil and waste oil USTs were removed, visual and olfactory observations, as well as PID screening of the floor and walls of the excavation, indicated some apparent petroleum-contaminated soils remained below the waste oil fill pipe. Two confirmatory

samples were collected from the floor of the excavation at the location of the ends of the USTs and analyzed for TPH under the same protocol described previously for the gasoline-contaminated excavation soil samples. The two samples with the highest headspace PID readings were selected for analysis. See Figure 9 for sample locations. Analytical results are summarized in Table 7 and laboratory reports are included in Appendix K. On May 29, 1991 overexcavation of contaminated soils was conducted with excavation ceasing when no staining was observed, no odors were discernable, and PID readings were nondetectable. After completion, soil samples were collected from the walls of the excavation (four total) and analyzed for TPH. Analytical results are summarized in Table 7 and laboratory reports are included in Appendix K. all ND on walls

TPH in the range of waste oils (#6 fuel oil) and not heating fuel oils were detected in the two samples collected from the floor of the excavation. Sample WOW, located at the west end of the waste oil UST, had an estimated TPH concentration of 2050 mg/kg in the range of #6 fuel oil. Sample FOW, located at the west end of the fuel oil UST, had an estimated TPH concentration of 53.2 mg/kg in the range of #6 fuel oil.

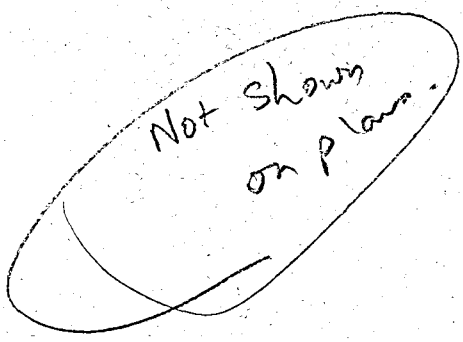
On July 25, 1991 approximately 60 cu yds of #6 fuel oil contaminated soils were sent to Parkview Landfill. At this time, further excavation of the floor of the excavation was conducted and another confirmatory sample was collected (WOBA) and analyzed for TPH. The sample had an estimated TPH concentration of 32.8 mg/kg in the range of #6 fuel oil.

Groundwater Recovery/Soil Vapor Extraction Well Installation

On May 23, 1991 a 6-in. diameter, galvanized steel, combination groundwater recovery/soil vapor extraction well (RW1) was installed in the northeast corner of the large gasoline UST excavation (Figure 4). The screen length was 10.3 ft. The excavation extended to more than 16 ft below grade, with the bottom of the well screen set at 16 ft. Pea gravel was backfilled to the top of the screen. Holes were drilled and a Monitor Brassy pitless adapter and a JCM Service Saddle were bolted to the well casing at depths of approximately 5.5

and 1.75 ft below grade, respectively. One-in. diameter SDR9 polyethylene piping was attached to the pitless adapter with compression fittings and placed in a 5 1/2 ft deep trench excavated to the west and north of the station and temporarily stubbed out at the proposed location of the potential remediation building on the north side of the station. Two-in. diameter SDR9 polyethylene was attached to the saddle with pressure fittings and placed in the same trench backfilled at a depth of 3 ft. Three quarter-in. electrical conduit and 1/2-in. copper tubing were also placed in this trench and stubbed out at the same depth as the 1-in. polyethylene. Both polyethylene lines were pressure tested at more than 55 psi prior to backfilling the trench.

Installation of the sump was performed at the concurrence of Mr. John Feeney of the WDNR after reviewing initial results of groundwater sampling from the onsite monitoring wells. Considerable cost savings were realized by installing the sump and piping during the site construction activities.



SECTION 7
CONCLUSIONS

Based on results of the site investigation and soil removal activities, the following conclusions are made:

Petroleum releases have occurred on site in the vicinity of the former gasoline USTs and the waste oil UST. Specific release incidents, however, are not documented.

Shallow soils onsite generally consist of 3 to 10.5 ft of silty clay fill underlain by interbedded silty clay, sandy and clayey silt, sand and gravel to maximum depths drilled of 13 to 15 ft. Depth to groundwater ranges form 5 to 7 ft below ground surface and occurs within the fill in some places. Groundwater flow is to the southeast.

Petroleum contaminated soils were present to depths of approximately 10 to 12 ft in the vicinity of the USTs and pump islands, likely resulting from leaking tanks and piping. Near the former pump island west of the station building, contaminated soils were present in the upper 5 ft. Contaminated soils did extend significant distances laterally from these apparent source areas, but where present, occurred primarily within the zone of water table fluctuation. Most of the contaminated soils were removed from the site ~~the~~ to the extent practicable.

Groundwater onsite exceeds Chapter NR 140, Wis. Adm. Code, Groundwater Quality Enforcement Standards for benzene only in two wells located at the south site boundary. Concentrations of benzene decreased from 862 to 212 ug/L and 57.9 to 26.3 ug/L, respectively, between May and June 1991. The potential for significant lateral migration of contaminated groundwater from the site at concentrations of concern appears low.

SECTION 8
REMEDIAL ACTION PLAN

Based on results of the site investigation, an initial remedial action plan was agreed upon between Good Hope Service, Mr. John Feeney of Wisconsin Department of Natural Resources (WDNR) and Warzyn. The plan included the following tasks:

- Removal of USTs and overexcavation and disposal contaminated soil from the UST and pump island areas.
- Installation of a combined groundwater recovery/soil vapor extraction well in the UST backfill area.

Evaluation of whether the remainder of the soil vapor/groundwater extraction system should be constructed will be based on the results of additional sampling of the monitoring wells and recovery well for analysis of BETX. Four quarterly rounds of sampling are recommended prior to making a decision on further site remediation.

Project: GOOD HOPE SERVICE
4230 W. GOOD HOPE ROAD
Location: MILWAUKEE, WI

Boring No. B2
Surface Elevation 712.9
Job No. 27336.00
Sheet 1 of 1

11925 WEST LAKE PARK DRIVE SUITE 200, MILWAUKEE, WIS. 53224 TEL.(414)359-1144

SAMPLE No.	TYPE	Rec (in.)	Moist	N	Depth	VISUAL CLASSIFICATION and Remarks	ENVIRONMENTAL DATA qu (qa) (tsf)	PID/FID Head Space ppm	PID/FID Field ppm	Methane %LEL	Monotox ppm
						Asphalt (3") and Yellowish Brown (10YR 5/4) Sand and Gravel Base Course					
1		2	M	6		FILL: Olive (5Y 4/2) Silty Clay, No Odor		6.0	1.0		
2		24	M	8	5	FILL: Light Olive Brown (2.5 Y 5/4) Fine to Medium Sand, Odor		6.0	2.0		
3		24	W	13		Medium Dense, Light Olive Brown (2.5Y 5/4) with Some Gray Mottling Silty Fine to Medium SAND, No Odor (SP-SM)		1.0	ND		
4		24	W	24	10	Increase in Medium Sand, Some Coarse Sand Below 9 ft 3 in. Well Rounded Sand Layer at 9.5 ft		4.0	ND		
5		24	W	21		Sporadic, Well Rounded Fine Gravel Below 11 ft		1.0	ND		
					15	End of Boring at 13.0 ft.					

WATER LEVEL OBSERVATIONS

	While Drilling ▽	Upon Completion of Drilling		
Time After Drilling	3 HRS	21 HRS		
Depth to Water	6.5'	6.0'		▼
Depth to Cave in	7.5'	7.2'		

The stratification lines represent the approximate boundary between soil types and the transition may be gradual.

[SITE #5]

WisDOT Phase 1 Hazardous Materials Assessment Site Summary

(rev. 8/01/2020)

WisDOT Project ID: 2967-00-07, MCDOT ID: WH118011
Highway/Street: W. Good Hope Road (CTH PP)
Termini/Limits: 51st St -Range Line Rd./N. Sherman Blvd./W. Green Tree Road
County: Milwaukee County

Property Information:
Site Name(s):Former Phil Tolkan Leasing[Site #5]
DOT parcel number (if known):
Property Address: 4301 W. Good Hope Road
Owner's Name: JMT VENTURES, LLC
Owner's Address:
Owner's Phone:
Current Land Use:Jerry's Service & Towing
Past Land Use:Fuel Station

Real Estate Requirements:
☒None ☐Total take ☐Strip acquisition of feet
☐Temporary Limited Easement (TLE)
☐Permanent Limited Easement (PLE)
☐ Other (describe)

Construction Requirements:
☒ Excavation within current right of way to 14 feet
☐ Excavation within proposed right of way to feet
☐ Excavation within easement to feet
☐ Public or private utility or sanitary or storm sewer installation or excavation to feet

Information from database searches and interviews:
Department of Safety and Professional Services (DSPS)
- ☒ site has registered tanks ☐ASTs ☒USTs
- ☐ tanks are currently in use
- ☒ tanks are abandoned date: 1985, 1991
- Tank contents:
  - ☒ Leaded gasoline ☒ Unleaded gasoline ☒ Fuel Oil ☐ Diesel
  - ☐ Kerosene ☐ Unknown ☒ Other (Waste/Used motor oil)
- ☐ site is a DSPS administered LUST site; DCOMM ID number:
- ☐ site is a closed DSPS LUST site; closure date:

Department of Natural Resources (DNR)
- ☒ site is a DNR administered LUST site; BRRTS number: 03-41-001859
- ☐ site is a DNR administered ERP site; BRRTS number:
- ☒ site is a closed ☒LUST ☐ERP site; closure date: April 1997
- ☐ site is a landfill
- ☐ site is an abandoned waste disposal site
- ☐ site is a hazardous waste generator
- ☐ Other (please describe)

WisDOT historic plan sets: site is a on project dated . Comments:
Business directories: site is in the directory dated Comments:

A check in a checkbox indicates a positive or "yes" response.

Aerial photos: Site has been occupied by a gasoline / auto service building since the 1960s.
☐ Contamination discovered at feet during utility or other excavation in the area. Indicate location on site map.
Interview Information or other comments:

Visual Evidence of Potential Contamination: (include additional information in space provided)
☒ No evidence of tanks
☐ USTs ☐ASTs Location, number and condition of tanks, contents, comments:
Location in relationship to current right of way: ☐ map attached
Location in relationship to proposed right of way: ☐ map attached
☐Drums ☐Stained soils ☐Odor ☐Sheen on surface water ☐Areas of excavation
☐ Areas of fill ☐Stressed vegetation ☐ Pond(s) ☐ Basins/sumps ☐ Monitoring wells
☐ Soil borings
Comments:

Potential for Contaminant Migration: (attach supporting documentation such as plume maps, summaries of site investigation or closure reports).
☒ Property is a potential source of contamination
☐ Adjacent property is a potential source of contamination. Include site name or BRRTS number if known, describe location, include contaminant type and any additional information.
☐ Contaminated soil known to be within proposed right of way from to feet below ground surface
☐ Contaminated groundwater known to be within proposed right of way at to feet below ground surface.
☐ Contaminated soil or groundwater within existing right of way. Attach copy of most recent investigation and plume maps.

Attachments – required
☒ Site photographs and a site map showing areas of concern
☐ Plat map showing parcel and any proposed areas of acquisition or easement
☐ Historic aerial photos of site - clearly outline site
☐ Historic WisDOT or other as-builts and plat maps - clearly outline site
☐ Plume maps for known contamination. Indicate existing or proposed right of way where applicable.

Recommendations
☐ No additional hazardous materials investigation is required.
☐ If construction or real estate requirements change, evaluation of need for further investigation will be necessary.
☐ Information is sufficient to use Standard Special Provisions. Copy of completed Standard Special Provision is attached.
☒ Conduct additional investigation
- ☐ Phase 2 (determine if contamination is present)
- ☒ Phase 2.5 (determine extent of contamination within existing R/W only)
- ☐ Phase 3 (determine full extent of contamination prior to acquisition)
- ☐ Phase 4 (remediate site)
- ☐ Other (describe)

Site #5
Former Phil Tolkan Leasing
4301 W. Good Hope Road
W. Good Hope Rd: STA 190+95 to 192+75 RT

The site is identified on the UST, LUST (BRRTS #03-41-001859), EDR Historical Auto, SHWIMS, RCRA NonGen, and FINDS database. Based on field reconnaissance, the site is currently occupied by Jerry's Service & Towing. Review of the Milwaukee County GIS & Land Information Interactive Map online indicates the site is owned by JMT VENTURES, LLC [Ref.1].

According to the Wisconsin Department of Agriculture, Trade and Consumer Protection (DATCP) Storage Tank Database there are five tanks registered to the site [Ref.2]. In September 1985, one 6,000-gallon unleaded gasoline UST, one 6,000-gallon leaded gasoline UST, and one 8,000-gallon UST with unknown content were closed / removed. One 550-gallon waste / used motor oil UST and one 1,000-gallon fuel oil UST were also closed and removed in October 1991. The occupancy for all tanks is listed as 'mercantile/ commercial'.

According to the EDR report, no Sanborn Map coverage is available for the project corridor. The EDR Historical Auto database indicates that auto services and petroleum UST systems have been utilized on-site between 1965 to 1988.

The SHWIMS database lists the site as an inactive, large quantity Hazardous Waste Generator of non-listed ignitable wastes. The wastes were most likely associated with auto service activities and the clean-up and removal of former UST systems at the site [Ref.3].

Himalayan's review of historical aerial photographs indicates the site was a vacant lot until the 1960s. By the 1963, a parking lot and commercial building were developed in the southwest corner of W. Good Hope Road and N. 43rd Street. Both roadways were widened into a two-lane divided intersection with right turn lanes, in 1970, and the existing building and pump islands were removed and redeveloped with a larger building and pump islands farther south. Comparison of pre-1970 and post-1970 aerial photographs indicates that the former pump islands were within the current east bound / right turn lane of W. Good Hope Road, and the former USTs were possibly within the current W. Good Hope Road right of way.

BRRTS #03-41-001859: In October 1991, the site owner received a notification of hazardous substances discharged at the site [Ref. 4]. Based on a report by Giles Engineering Associates, Inc. (Giles), eleven borings (B1 to B11) were advanced at the site in November 1991 with a maximum depth of 21 ft bgs. Three borings were converted to groundwater monitoring wells (MW1-MW3). Soil samples were analyzed for GRO, DRO, petroleum volatile organic hydrocarbons (PVOCs), lead, and cadmium, and groundwater was analyzed for DRO, VOCs, PAHs, lead, and cadmium [Ref.5].

Based on Giles's inspection of tank removal activities at the site in October 1991 and over-excavation in March 1992, approximately 949 tons of impacted soil was removed from the former UST locations and transported off-site to a sanitary landfill. Prior to backfilling with clean material, 20 confirmation soil samples (S1 to S20) were collected from the bottom and sidewalls of the former tank excavation at depths ranging from 5 to 16 feet bgs [Ref. 5]. All confirmation samples were analyzed for PVOCs.

According to Warzyn, most of the contaminated soil was removed from the site except underneath the east side of the existing building and adjacent building at 7161 N. 43rd Street. Following an additional groundwater sampling event in 1993, Giles also concluded that groundwater impacts were no longer present at the site. The activity was conditionally closed by the Wisconsin DNR in April 1997, with on-site residual soil contamination [Ref.5].

Geology / Hydrogeology

Based on Giles's report, soils at the site consisted of fill material (mainly silty sand and gravel) from the ground surface to 4 feet bgs. The fill material was underlain by inconsistent seams of native brown sand and silty clay. Groundwater depth was 4.5 to 8 feet bgs with an undetermined flow direction [Ref.5].

Based on the USDA NRCS soil survey report, soils along the site consist of Clayey land (Cv). Clayey land is generally described as areas where development activities have either covered over or removed the original solum of the soil, therefore, native soil conditions are no longer present within the project corridor. This soil type is described as moderately well drained and the depth to groundwater is generally about 12 to 80 inches bgs. [Ref.6]

Soil Impacts

According to Giles's initial site investigation and tank closure inspection, most of the impacted soil was removed off-site during the tank removal / installation activities at the site in May and July 1991. However, lab results indicate that soil contamination may still be present along the south side of the property, former pump islands, and east side of the current building at the site. Soil confirmation samples S1, S7, S10, S12, S13, S15, S19, and S20 had DRO (12.28 to 21.7 mg/kg), benzene (16 to 1,116 µg/kg), ethylbenzene (20.0 to 1,190 µg/kg), toluene (20 to 68 µg/kg), and xylene (4 to 816 µg/kg) concentrations [Ref. 5]. The benzene concentrations in S1, S7, S10, S12, S13, S19 and S20 at depths ranging from 6 to 16 feet bgs exceeded the NR720 RCL.

Residual contamination was also detected near the former post-1970 pump islands (B7). However, no additional investigation or clean-up activities were performed along the former pre-1970 and/or post-1970 piping runs and pump island locations. The current condition of these UST systems is unknown and a potential release of petroleum products from these former UST

systems could have possibly impacted local soil conditions at the site and within the current W. Good Hope Road right of way and east bound lane of W. Good Hope Road.

It appears that residual soil contamination is within the current W. Good Hope Road right of way and possibly underneath the roadway.

Groundwater Impacts

Based on the most recent groundwater sampling event in March 1992, no PVOCs were detected in MW-2 and MW-3 [Ref.5]. However, no additional investigation activities were performed near the former pre-1970 and/or post-1970 piping runs and pump island locations. The current condition of these UST systems is unknown and a potential release of petroleum products from these former UST systems could have possibly impacted local groundwater conditions at the site and within the current W. Good Hope Road right of way and east bound lane of W. Good Hope Road.

It appears that the groundwater contaminant plume may still be present within the current W. Good Hope Road right of way and possibly underneath the roadway.

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site.

Recommendations

Considering the historical land use (gasoline service station for over almost 40 years) and unknown condition of former UST systems located within the current W. Good Hope Road right of way and possibly underneath the roadway, this site could possibly impact the proposed improvements. Therefore, further investigation is recommended for the site.

The need for further investigation could be re-evaluated once construction and/or real estate requirements have been finalized.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

TO: JOHN FEENEY

CORRESPONDENCE/MEMORANDUM — **State of Wisconsin**

DATE: April 15, 1997 FILE REF: Tolkan Leasing

TO: Closeout Committee, SER

FROM: Larry Lester, SCR

SUBJECT: Petroleum Contamination, Tolkan Leasing Site 4301 West Good Hope Road, Milwaukee 241440320

SITE HISTORY

Previous to 1985, five underground storage tanks (UST) existed in a common tank bed at the Tolkan site. In 1985 three gasoline UST's were removed. In October of 1991 the remaining two tanks (waste oil and fuel oil) were removed. Samples obtained after this second round of tank removals, resulted in GRO detections of 44 ppm and DRO at 630 ppm under the tanks.

Investigation conducted at the site in November of 1991, included eleven soil borings, of which three were developed as groundwater monitoring wells. Groundwater was determined to be seven to nine feet below ground surface. VOC's including benzene (4, 6 ppb- MW1, MW2), ethylbenzene (4 ppb-MW1), 1,1 dichloroethene (3 ppb-MW3), cis 1,2 dichloroethylene (3 ppb-MW3), toluene (5 ppb-MW3) and MTBE (24 ppb-MW3) were detected in groundwater. Soil borings in all but three borings were reportedly non detectable (<10ppm). Three soil borings reportedly had detectable levels of GRO (up to 16.4 ppm) and DRO (up to 16.1 ppm).

In March of 1992, approximately 949 tons of contaminated soils were removed and disposed by landfilling. Southern sidewall excavation samples confirmed that contaminated soils were left in place (GRO 12 ppm, DRO 21.7 ppm) at 9 feet bgs, due to proximity to a neighboring building foundation. Additional groundwater samples were obtained from MW's 1 & 2 (WM3 had been excavated) and submitted for analysis. Results indicated no VOC or PVOC detects in groundwater. In June of 1992 closure was requested by Giles Engineering, on behalf of Tolkan.

On review of the closure request for the site, the WDNR project manager noted an apparent discrepancy in laboratory data. Despite reportedly low or non detects in the closure samples for GRO and DRO, associated benzene levels were as high as 1,116 (ppb).

Printed on Recycled Paper

In January 1993, the WDNR project manager requested that Tolkan submit supporting laboratory documentation for the closure samples, conduct a soil vapor survey adjacent to the neighboring building to assess potential migration of vapors, and prepare a deed notice indicating the presence of contamination at depth at the property. In April of 1993 Giles submitted the results of a soil vapor survey and laboratory analysis of groundwater samples from the two remaining on site wells. The soil vapor survey indicated that there was minimal potential for migration of petroleum vapors to the adjacent property building. Groundwater laboratory results indicated no detectable levels of PVOC's.

On review by the LUST chemist, the supporting laboratory documentation data was found to be deficient and the closure sample results were determined to be unreliable. In June of 1994 Giles submitted a site confirmation sampling plan proposing six geoprobe borings. The proposed plan included submittal of nine soil samples and one groundwater sample for laboratory analysis. Determination of site closure or the need for additional work was placed on hold pending the outcome of a contested case hearing with Suburban Laboratories.

OPTIONS

A. Conduct closure confirmation work as planned by Giles Engineering on behalf of Tolkan Leasing, to include six geoprobe borings, laboratory analysis of nine soil samples and one groundwater sample, from Monitoring well #2.

B. Submit for laboratory analysis, one groundwater sample obtained from groundwater monitoring well #2.

C. Close site based on existing site information.

SOIL REMOVAL MONITORING SERVICES
AND
POST TREATMENT GROUNDWATER EVALUATION

TOLKAN LEASING COMPANY FACILITY
4301 WEST GOOD HOPE ROAD
MILWAUKEE, WISCONSIN
GEA PROJECT NO. 1E-920120

1.0 INTRODUCTION

Giles Engineering Associates, Inc. (GEA) monitored the removal of petroleum-affected soil at the Tolkan Leasing Company property, located at 4301 West Good Hope Road (subject site), during the period of March 4 to March 6, 1992. The excavation and hauling of soils was conducted by North Shore Excavating, and petroleum-affected soils were disposed at Parkview Landfill, Menomonee Falls, Wisconsin. Subsequent to the soil removal activities, post-treatment groundwater evaluation from the remaining groundwater monitoring wells was performed. An overview of the project and corresponding recommendations are provided in the following sections.

2.0 SUMMARY OF FINDINGS

1) Approximately 948.68 tons (680± cubic yards) of petroleum impacted soils were removed from the property during the soil remediation activities. The petroleum-impacted soils were removed from the subject site by North Shore Excavating, Inc. and transported to Parkview Landfill. In addition, 18 loads of concrete rubble were removed off-site and disposed at Shoreline of Wisconsin, and perched groundwater which collected within the removal excavation was directly disposed into the MMSD sanitary sewer system.

2) Analytical testing performed on representative samples of the in-situ soils remaining within the excavation bottom northern sidewall, western sidewall, northern portion of the eastern sidewall and the western portion of the southern sidewall indicate no detectable concentrations of Gasoline Range Organics (GRO) and Diesel Range Organics (DRO) compounds. One sidewall soil sample (S1) collected from the extreme southeastern corner of the removal excavation (-15± feet) contained a low concentration of DRO (12.28 ppm). Several of the bottom and sidewall samples also contained measurable concentrations of some of the PVOC compounds.

3) Representative samples of soils which remain in-place within the eastern half of the southern sidewall (sample S14 at -9± feet) indicate petroleum-impacted soils remain in-place in this area. A GRO concentration of 12 ppm and a DRO concentration of 21.7 ppm was measured within a representative soil sample collected from this area. Additional removal of this material could not be performed for safety and support purposes due to the proximity of the adjacent neighboring structure.

4) The results of analytical testing performed on the landfilled soil samples for the purposes of this report, in conjunction with the analytical testing performed on soil samples for the purposes of previous reports (GEA Project Nos. E-9011014 and E911101) indicated an average GRO concentration of 57.4 ppm (measurable concentrations ranging from 15.6 to 292 ppm) and an average DRO concentration of 127 ppm (measurable concentrations ranging from 12.1 to 630 ppm).within the soils removed and disposed at Parkview Landfill.

5) Water which had accumulated within the excavation was directly pumped into the Milwaukee Metropolitan Sewage District (MMSD) Sanitary Sewer System following approval of application disposal by the MMSD. The results of post-treatment evaluation of groundwater collected from the two remaining downgradient monitoring wells, which were not abandoned during excavation, (MW2 and MW3) indicate that no detectable concentrations of PVOC compounds were present within groundwater collected from MW2 (located to the east-southeast of the excavation) and no detectable concentrations of VOC compounds were present within groundwater collected in tests from monitoring well MW3 (located in the northwestern portion of the property). The groundwater from MW3 contained no detectable concentrations of GRO or DRO, and the groundwater from MW2 contained a very low concentration of DRO (0.60 ppm) and no detectable concentrations of GRO.

3.0 CONCLUSIONS AND RECOMMENDATIONS

1) Based on the results of the excavation and disposal activities performed to-date, adequate removal of petroleum-impacted soils is considered to have been performed. Petroleum-impacted soils remain in-place within the southern wall of the excavation area. However, the levels that remain in-place are not considered to warrant additional removal; further removal and/or remediation is also not considered feasible due to the location of the adjacent structure.

2) Based on the results of the post-treatment groundwater evaluation, removal of the petroleum-affected soils and groundwater which had collected within the removal excavation is considered to have adequately remediated groundwater which was previously determined to contain a Benzene concentration above the WDNR Preventive Action Limit and Enforcement Standard (Monitoring Well Nos. MW1 and MW2). Testing of groundwater from MW2 and MW3 (which previously contained measurable concentrations of several VOC compounds above the WDNR Preventive Action Limits) indicated no measurable concentrations of PVOC or VOC compounds, respectively. Further groundwater remediation is therefore not considered to be warranted at this time.

3) Based on the Soil Removal Monitoring Services and Post Treatment Groundwater Evaluation conducted on the subject site, it is recommended that closure status be assigned to the Tolkan Leasing Company Facility by the WDNR.

4) In accordance with the WDNR LUST Site Assessment Guidelines and Chapter 144 of the Wisconsin State statutes, copies of this report will be submitted to both the Wisconsin Department of Natural Resources (Mr. John Feeney) and the Wisconsin Department of Industry, Labor and Human Relations (WDILHR).

4.0 SITE BACKGROUND

4.1 Site Location

The subject property is referenced by the street address of 4301 West Good Hope Road, and is located at the southwest corner of the intersection of North 43rd Street and West Good Hope Road, in the City of Milwaukee, Milwaukee County, Wisconsin. The property is located in the northeast one-quarter of the northeast one-quarter of U.S. Public Land Survey Section 23, Township 8 North, Range 21 East. The location of the subject site is indicated on the following Area Location Plan (Figure 1).

4.2 Site Description and History

The subject site is presently occupied by the Tolkan Leasing Company Facility which consists of a one-story brick structure with a surrounding asphaltic concrete parking lot. It is understood that the structure was constructed in the late 1960's as a Standard Oil/gasoline service station facility. It is also understood that the site was occupied by another service station and a private dwelling with a garage prior to development of the Standard Oil service

AND CONSTRUCTION MATERIALS CONSULTANTS

station. The location of the Standard Oil service station facility and the former service station and residence are indicated on the following Figures 2 and 3, respectively. Based on information provided by the client and review of a site plan (dated July, 1968) it is understood that at least five (5) underground storage tanks (USTs) associated with the Standard Oil service station occupied the subject site. Three (3) of the tanks (two-6,000 gallon capacity and one-8,000 gallon capacity) were used to store gasoline and were removed approximately 6± years ago (September 15, 1985). The two (2) remaining tanks consisted of a 550 gallon waste oil tank and a 1,000 gallon fuel oil tank which were removed from the property on October 14, 1991.

5.0 PREVIOUS STUDIES

GEA performed the Underground Storage Tanks Closure and Removal Assessment and Preliminary Petroleum Hydrocarbon Assessment Study (GEA Project No. E911014, dated October 28, 1991) for removal of the waste oil and fuel oil tank. The results of that study indicated the presence of petroleum impacted soil within the UST excavation. Slight to strong petroleum odors were noted and moderate to high vapor levels (ranging from 30 to 300 HNU-units) were measured in several of the soil samples collected during the UST closure activities. The results of analytical testing on select soil samples indicated the presence of Gasoline Range Organics (GRO) levels of up to 44 parts per million (ppm) and DRO levels of up to 630 ppm within soil samples collected from the UST excavation. Based on the results of the UST removal monitoring services, it was recommended that a Phase II Environmental Site Assessment be performed.

The Phase II Environmental Site Assessment (GEA Project No. E-911101, dated December 20, 1991) was then performed on the subject site. This report documented the results of subsurface exploration and analysis which consisted of eleven 11 exploratory borings and installing groundwater monitoring wells in three (3) of the test boring locations. Copies of the test boring logs from the previous study are included as Appendix 1. Soil and groundwater samples were collected from the test borings and monitoring wells, respectively. A Boring and Monitoring Well Location Plan is included as the following Figure 4.

The results of the Phase II Environmental Site Assessment indicated that soil and groundwater samples on the subject site were impacted with petroleum hydrocarbon compounds at concentrations above WDNR clean-up guidelines. Soils impacted with petroleum hydrocarbons were generally located within the vicinity of the former UST area, and the most feasible remediation system was considered to consist of removal of the petroleum impacted soils and disposal off-site at Parkview Landfill in Menomonee Falls, Wisconsin. In summary, it was determined, based on the results of the assessment, that approximately 700 to 800± cubic yards of petroleum impacted soils would require over-excavation and removal to Parkview Landfill.

Groundwater in the vicinity of the former UST (MW1 and MW2) area was determined to be affected with Benzene concentrations above the WDNR Preventive Action Limit (PAL) and Enforcement Standard (ES). In addition, groundwater collected from MW3 was determined to be affected with several VOC compounds (Methylene Chloride and Methyl tert-butyl ether) above WDNR PAL's. It was considered that the groundwater encountered represented shallow perched water within the former tank area and surficial fill soils. Testing of groundwater and application for approval to directly dispose of the water into the sanitary sewer system of the Milwaukee Metropolitan Sewer District during the recommended soil removal activities was recommended. Following the soil removal activities, additional sampling of the remaining monitoring wells (MW2 and MW3) was recommended to evaluate the effectiveness of the soil removal activities on the groundwater quality. The results of the additional groundwater testing are provided within Section 7.0 of this report.

6.0 PROJECT DESCRIPTION

6.1 Soil Excavation

Over-excavation activities commenced on the subject site on March 4, 1992. North Shore Excavating, Inc., of Mequon, Wisconsin performed the excavation and trucking services, and GEA monitored the soil excavation process. A Soil Sampling Plan indicating the approximate lateral and vertical extent of the removal excavation and sample numbers and location is included as the following Figure 5.

Excavated petroleum impacted soils were removed from the former UST tank pit area and trucked off-site to the Parkview Landfill in Menomonee Falls, Wisconsin. In total, approximately 948.68 tons (680± cubic yards) of petroleum impacted soils were removed from the excavation. In addition, during the removal operations it was determined that a significant portion of the former tank pit area had been

Notes:

backfilled with concrete rubble fill. The concrete rubble was removed from the excavation, separated from the petroleum impacted soils and disposed off-site at Shoreline of Wisconsin. In total, 18 loads of concrete were removed from the subject. Site photographs illustrating the removal activities, typical excavation sidewalls and bottom, backfilling procedures and concrete rubble fill encountered are included as Exhibits 1-3 within Appendix 2.

During the soil excavation procedures, water was encountered within the miscellaneous fill materials associated with the former tank pit backfill. Prior to the over-excavation activities, approval for direct disposal of the groundwater into the Milwaukee Metropolitan Sewage District (MMSD) Sanitary Sewer System was obtained. A copy of the Notice of Intent to Discharge Industrial Waste Water application and two MMSD response letters are included as Appendix 3 of this report. The groundwater encountered was pumped by North Shore Excavating, Inc. (using a 3 inch pump) directly into the sanitary sewer system.

During the over-excavation activities, one of the three groundwater monitoring wells previously installed on-site (MW1) was removed completely to the bottom of the screened section of the well, a well abandonment form is included as Appendix 4.

6.2 Subsurface Conditions

Soils removed from the former tank pit and petroleum impacted soil area generally consisted of a non-homogeneous mixture of brown to gray brown silty fine to coarse sand to black silty fine to coarse sand, gray brown silty clay and brown silty clay. As described, concrete rubble fill was generally encountered within the top 8± feet of the former tank pit area. In general, fill soils extended to depths ranging from approximately 10 to 16± feet, consistent with the conditions encountered at the previously performed test boring locations, with the underlying soils generally consisting of brown to gray silty clay with fine to coarse sand and gravel. In total, 15 to 16± vertical feet of materials were removed from the former tank pit and petroleum impacted soil area.

6.3 Backfilling Procedures

Following the petroleum impacted soil remediation activities, crushed stone backfill material (No. 1 stone) was placed within the removal excavation between March 6, 1992 and March 12, 1992, and minimally compacted by the contractor using the backhoe bucket. In total, 786.9 tons of No. 1 stone and 37.1 tons of ¾ inch crushed stone were utilized to backfill the removal excavation. It should be

noted that due to the minimal compactive effort applied to the backfill materials, long-term settlement of the backfill materials and some pavement deterioration may occur over time. The property owner was informed of this possibility prior to the remediation activities and accepted the long-term risk.

6.4 Sample Collection and Results

Daily monitoring of the removal operations was conducted by GEA personnel, and included: 1) diagraming the width and depth of the excavation; 2) identifying the affected areas; and 3) collecting soil samples from each truckload of petroleum-impacted soils to be landfilled, from the excavation floor (bottom samples) and from the excavation sidewalls (sidewall samples).

Split soil samples were obtained from the landfilled materials and the soils remaining within the excavation sidewalls and bottom for classification, volatile vapor scans, and analytical testing. The collected soil samples were placed in new, laboratory approved glass sampling jars with Teflon® coated lids. The soil samples collected for analytical testing were placed in 4 ounce sampling jars, sealed, and placed in a cooler. One of each set of the split soil samples (collected in 8 ounce sampling jars) was also subjected to a head-space volatile vapor scan using a properly maintained and charged 11.7 eV Photoionization Detector (HNU Model No. PI-101) calibrated to a Benzene standard (HNU span gas Part No. 101-350). The volatile vapor scan technique is a screening method used to evaluate the presence of certain potentially hazardous compounds such as petroleum hydrocarbon compounds. The head-space sample containers were filled 1/2 to 3/4 full, covered, and allowed to warm to approximately room temperature prior to the vapor scans. The head-space samples were also agitated for 30± seconds prior to the vapor scan. The HNU was calibrated before, during and after the volatile vapor scans.

Based on the results of the field screening, including a visual and odor evaluation of the soils, the removed materials were over-excavated for disposal at Parkview Landfill. A Soil Sampling Plan is included as Figure 5 (page 5a) and indicates a plan view of the locations of the sidewall and bottom samples. Daily soil sampling field logs indicating the sampling location, depth, sample classification and PID test results of both the landfilled soils and the bottom sidewall samples are included as Log Nos. 1 through 4, enclosed in Appendix 5 of this report.

Selection of soils for analytical testing was performed in accordance with WDNR guidelines. Sidewall and excavation bottom samples were collected at approximately 25± feet grid intervals of the excavation. In addition, a representative sample of the landfill soils was collected for every 300± cubic yards of material removed from the excavation. The sidewall and bottom samples were submitted to a subcontracted analytical laboratory to test for the presence of Gasoline Range Organics (GRO), Diesel Range Organics (DRO) and Petroleum Volatile Organic Compounds (PVOC) in accordance with the WDNR LUST Guidance Manual (June, 1991). In addition, one soil sample collected from the bottom of the removal excavation was submitted for testing for the presence of Polynuclear Aeromatic Hydrocarbons (PAH). The landfilled samples (collected at the time of removal off-site) were tested for the presence of GRO and DRO. During the removal operations, representative samples of petroleum-impacted soils were also collected from the eastern end of the southern sidewall of the removal excavation adjacent to the neighboring adjacent building to document the condition of the petroleum-impacted soils that remained in-place in this area. Additional removal was not performed in this area due to the proximity of the adjacent structure and structural concerns with respect to potential undermining of the neighboring building foundation system. A summary of the analytical testing performed on the bottom samples, sidewall samples, and landfilled samples is included in the following paragraphs. Copies of the chain-of-custody document and the analytical test results on the subcontracted laboratories letterhead are enclosed as Appendix 6.

6.4.1 Bottom Samples

Four representative samples (Sample Nos. S6, S13, S19, and S20) of the materials which remain in-place at the bottom of the removal area were submitted for analytical testing. A summary of the GRO and DRO test results indicating the location of the collected bottom samples (in plan view) and the GRO and DRO test results are included on the following Figure 6. In addition, a summary of the GRO and DRO testing is included on Table 1, a summary of the PVOC testing is included on Table 2, and a summary of the PAH testing is included on Table 3.

In summary, the soils samples collected from the bottom of the removal area contained no detectable concentrations (less than 10 ppm) of GRO and DRO. Several of the bottom soil samples did contain measurable concentrations of several of the PVOC compounds (Benzene, Toluene, Ethlbenzene and MTBE); however, none of the PVOCs were at concentrations that warrant additional soil removal or remediation.

1E120T3 (6\16\92\BU1)

No detectable concentrations of the PAH compounds were present within the bottom soil sample tested.

6.4.2 Sidewall Samples

Representative samples of the sidewall materials which remained in-place at the lateral extent of the removal excavation were collected from 25± feet grid intervals in the removal area. In addition, a representative sample of the petroleum-impacted soils remaining within the southern removal excavation wall adjacent to the neighboring structure was collected. Eight representative samples of the sidewall materials were submitted for analytical testing to test for the presence of GRO, DRO and PVOC. A summary of the GRO and DRO analytical testing of the sidewall samples at the sample locations (in plan view) is included on Figure 6 (page 9a), and (GRO/DRO and PVOC) test results are summarized in the following Tables 4 and 5.

The test results indicate that the soils that remain in-place along the north, west, north end of the east sidewall and west end of the southern removal excavation sidewall contain no measurable (less than 10 ppm) concentrations of both GRO and DRO. The soil sample (S1) submitted for analysis from a depth of 15± feet at the extreme southeastern corner of the removal excavation contained a low concentration of DRO (12.28 ppm) and no measurable concentration of GRO (less than 10 ppm). Additional removal was not performed in this area due to the presence of the adjacent structure. The results of the PVOC testing indicates several of the samples have measurable concentrations of several of the PVOC analytes, however, not at concentrations which warranted additional removal or remediation.

A representative sample of the petroleum-impacted soil which remains in-place within the south wall of the removal excavation indicate that a GRO concentration of 12.0 ppm and a DRO concentration of 21.7 ppm was measured within the soil sample tested. This soil sample did not however have any measurable concentrations of PVOC compounds.

6.4.3 Landfilled Samples

During the removal operations, every 15± cubic yards of soil removed from the excavation was field screened with a PID to evaluate the necessity for removal. In addition, a representative sample of approximately every 300± cubic yards (3 samples in total) removed from the excavation was submitted to the subcontracted analytical laboratory to test for the presence of GRO and DRO concentrations.

GEOTECHNICAL, GEO-ENVIRONMENTAL, GEO-HYDROLOGICAL AND CONSTRUCTION MATERIALS CONSULTANTS

The results of the analytical testing performed on the landfilled soil samples are included on the following Table 6. GRO concentrations ranging from 15.61 to 292 ppm were measured within the soil samples tested. DRO concentrations of less than 10.0 to up to 168 ppm were measured.

7.0 POST TREATMENT GROUNDWATER EVALUATION

Subsequent to the soil removal activity, and in accordance with the recommendations provided in the previously submitted Phase II Environmental Site Assessment (GEA Project No. E-911101), the groundwater quality on the subject site was evaluated after soil remediation activities were completed. The additional analysis was recommended since groundwater in the vicinity of the former underground storage tank was affected with Benzene concentrations above WDNR Enforcement Standards (ES) in MW2 and above the Preventive Action Limit (PAL) in MW1, and since several VOC compounds were at detected concentrations above WDNR PALs in MW3.

Groundwater was collected for the purposes of the Post Treatment Groundwater Evaluation from Monitoring Well Nos. MW2 and MW3. Monitoring Well No. MW1 was completely removed during the soil removal activities. The groundwater monitoring wells were purged using a Teflon® barrier until approximately 4 well volumes were removed. Following proper purging, groundwater collected from MW2 was submitted to a subcontracted analytical laboratory to test for the presence of GRO, DRO and Petroleum Volatile Organic Compounds (PVOC) since only Benzene was detected in previous analytical testing of groundwater collected from MW2. Groundwater from MW3 was tested for GRO, DRO and VOCs since test results previously indicated the presence of several VOC compounds (including Methylene Chloride and Methy tertbutyl ether) above WDNR PALs. A Chain-of-Custody record, and groundwater analytical test results on the subcontracted laboratories letterhead is included in Appendix 7.

The results of the analytical testing indicate the groundwater collected from MW2 contained no measurable concentrations of PVOC compounds and no measurable concentrations of GRO, but a low concentration (0.60 ppm) of DRO. Groundwater collected from MW3 contained no detectable concentrations of any of the VOC compounds and no detectable concentrations of GRO or DRO. A summary and comparisons of the GRO, DRO and previously detected VOC compounds is included on the following Table 7.

In conjunction with the Post Treatment Groundwater Analytical Testing, groundwater levels were also measured. A summary of the previous groundwater elevations (performed for the purposes of the

previously submitted Phase II Environmental Site Assessment) and for the Post Treatment Groundwater Evaluation are included in the following Table 8.

Based on the analytical test results performed on the groundwater, it is anticipated that pumping of the groundwater which collected within the removal excavation into the MMSD Sanitary Sewer System adequately removed the previously encountered petroleum-impacted groundwater.

8.0 GENERAL COMMENTS

This report has been prepared for the exclusive use of Tolkan Leasing Co., Inc. and may not be reproduced or distributed without written authorization from Giles Engineering Associates, Inc. or Tolkan Leasing Co., Inc.

This report has been prepared in order to aid in the evaluation of the Tolkan Leasing Co., Inc. property (subject site) located at 4301 West Good Hope Road in Milwaukee, Wisconsin, with regard to the presence of petroleum hydrocarbon products at the time of this study. No other intent is implied. The conclusions presented in this report were based on available information pertaining to various points in time or were presented by others for use by GEA and based on informal discussions with various agency personnel.

The conclusions in this report may rely on others credibility and, therefore, an alteration in documentation or verbal information obtained may result in the redirection of the conclusions presented in this report. The conclusions are also based on visual field observations performed within the property boundaries at a specific point in time and, therefore, do not include the structural fill placed on the subject site after the completion of the study.

Soil samples collected from the removal operations will be retained for a period of 30 days and will be disposed at that time if no other instruction is received.

This report has been prepared in accordance with generally accepted practice in the field of Geoenvironmental consulting at the time of report preparation. No other warranty is either expressed or implied.

APPENDIX

The boring logs and related information enclosed in the appendix depict subsurface conditions only at the specific locations drilled and at the particular times designated on the logs. Soil conditions at other locations may differ from conditions occurring at these boring locations. Also the passage of time may result in a change in the soil conditions at the boring locations drilled.

PHASE II ENVIRONMENTAL SITE ASSESSMENT

TOLKAN LEASING COMPANY FACILITY
4301 WEST GOOD HOPE ROAD
MILWAUKEE, WISCONSIN
GEA PROJECT NO. E-911101

1.0 EXECUTIVE SUMMARY

Giles Engineering Associates, Inc. (GEA) has completed a Phase II Environmental Site Assessment on the Tolkan Leasing Company property (subject site). The environmental services provided by GEA were performed at the request and authorization of Mr. Ken Petersen.

Results of analytical tests on soil and groundwater samples collected as part of this study indicate that soil and groundwater on the subject site are affected with petroleum hydrocarbon compounds at concentrations above WDNR Clean-up guidelines. Therefore, remediation is considered necessary on the subject site. It appears that soils affected with petroleum hydrocarbons are generally located within the vicinity of the former underground storage tanks area. The most feasible remediation system is considered to consist of removal of the petroleum affected soils and disposal off-site at an approved landfill. Prior to the initiation of overexcavation and removal activities, it is recommended that an additional soil sample be obtained for the purpose of performing a waste characterization on the materials prior to landfill disposal. Removal activities should be monitored by a geoenvironmental consultant and should include analytical testing of soils which remain in-place to prove that adequate removal has been performed.

Groundwater in the vicinity of the former underground storage tank area is affected with Benzene concentrations above the WDNR Preventive Action Limit (PAL) and Enforcement Standard (ES). This groundwater is anticipated to be shallow perched water within the former tank pit area. It is recommended that prior to the excavation activities, the groundwater be tested to determine if direct disposal during remediation activities into the sanitary sewer system of the Milwaukee Metropolitan Sewerage District can be performed. Post treatment evaluation of the groundwater will be necessary after the recommended remediation activities. Groundwater tested in the northwestern portion of the site (MW3) indicated the presence of several VOC compounds at concentrations above WDNR PALs. Additional monitoring of the groundwater in this area may therefore be required by the WDNR.

It is anticipated that considerable concrete rubble is present within the former underground storage tank area. Extreme care should therefore be utilized by the excavating contractor due to possible instability of the surface in this area. Care should also be utilized during excavation activities not to compromise the support of the existing structures.

In accordance with Chapter NR 140.14 of the Wisconsin Administrative Code, a copy of this report is recommended to be forwarded to the Wisconsin Department of Natural Resources Southeast District Headquarters, as written compliance with the Wisconsin Administrative Code. In addition, to maintain eligibility under the Petroleum Environmental Clean-Up Fund Act (PECFA), a copy of this report is recommended to be forwarded to WDILHR.

2.0 SITE BACKGROUND

2.1 Introduction

It was requested by Tolkan Leasing Company that the subject property be evaluated by Giles Engineering Associates, Inc. (GEA) to evaluate the subsurface soil and groundwater conditions and quality with respect to the potential presence of petroleum hydrocarbon compounds resulting from previous underground storage tanks (USTs) associated with gasoline service station facilities that were located on the property. The scope of services included:

1) a subsurface exploration consisting of drilling eleven (11) test borings to depths of 16 to 21± feet below the existing ground surface, and the installation of groundwater monitoring wells in three of the test borings;

2) the collection and classification of soil samples at 2½ foot sampling intervals to the depth of boring termination at each of the test boring locations;

3) the collection of a groundwater sample from each of the groundwater monitoring wells;

4) a head space volatile vapor scan of all collected soil samples using an HNU Model PI 101 11.7 eV Photoionization Detector (PID);

5) analytical testing of select soil samples for the presence and concentration levels of Gasoline Range Organics (GRO), Diesel Range Organics (DRO), Volatile Organic Compounds (VOCs), Petroleum Volatile Organic Compounds (PVOCs), Lead, Cadmium and Polynuclear Aromatic hydrocarbons (PAHs), in accordance with the LUST analytes for soils affected with unknown petroleum products as described in the WDNR Leaking Underground Storage Tank (LUST) Analytical Guidance manual (June, 1991);

6) analytical testing of groundwater samples obtained from each groundwater monitoring well for the presence and concentration levels of volatile organic compounds (VOCs), Polynuclear Aromatic Hydrocarbons (PAHs), Diesel Range Organics (DROs), Cadmium and Lead in accordance with the LUST analytes for groundwater affected with unknown petroleum as described in the WDNR LUST Analytical Guidance manual (June, 1991); and

7) an evaluation of the information collected relative to current Wisconsin Department of Natural Resources (WDNR) regulations.

2.2 Site Location

The Tolkan Leasing Company property is located on the southwest corner of the intersection of North 43rd Street and West Good Hope Road, at the street address of 4301 West Good Hope Road in the City of Milwaukee, Milwaukee County, Wisconsin. The property is located in the northeast one-quarter of the northeast one-quarter of U.S. Public Land Survey Section No. 23, Township 8 North, Range 21 East. The location of the subject site is indicated on the Area Location Plan (Map 1) and Site Location Plan (Map 2) enclosed with this report.

2.3 Site Description

The subject site is presently occupied by the Tolkan Leasing Company facility which consists of a one story brick structure with a surrounding asphaltic concrete parking lot. It is understood that the structure was constructed in the late 1960's as a Standard Oil gasoline service station facility. It is also understood that the site was occupied by another service station and a private dwelling with a garage prior to the Standard Oil service station. The location of the Standard Oil service station facilities and the former service station and residence are indicated on Maps 3 and 4, respectively, enclosed with this report. Based on information provided by the client and review of a Site Plan (dated July, 1968) provided by the client, it is understood that at least five underground storage tanks (USTs) associated with the Standard Oil service station occupied the subject site (as illustrated on Map 3 enclosed). Three of the tanks (two 6,000 gallon capacity and one 8,000 gallon capacity) were used to store gasoline and were removed approximately 6± years ago (September 15, 1985). The two remaining tanks consisted of a 550 gallon waste oil tank and a 1,000 gallon fuel oil tank which were removed from the property on October 14, 1991. Based on field observations and a review of the 1968 Site Plan suppled by the client, all five tanks shared a common tank pit. Former tanks associated with previous service, as indicated on Map 4, may have been present.

The site is slightly higher in elevation than the adjacent properties and site topography slopes down from the existing structure to the roadways with approximately 2± feet of elevation differential. Surrounding properties are generally developed with commercial and residential structures. The location of the site relative to surrounding properties and uses is illustrated on Map 2 enclosed with

this report. Photographs of the subject site and surrounding area are included as Figures 1 and 2.

GEA performed the Underground Storage Tanks Closure and Removal Assessment and Preliminary Petroleum Hydrocarbon Assessment Study (GEA Project No. E-911014, dated October 28, 1991) for removal of the waste oil and fuel oil tank. The results of that study indicated the presence of petroleum affected soils within the UST excavation. Slight to strong petroleum odors were noted and moderate to high vapor levels (ranging from 30 to 300 HNU units) were measured in several of the soil samples collected during the UST closure activities. The results of analytical testing on select soil samples indicated the presence of Gasoline Range Organics (GRO) levels of up to 44 parts per million (ppm) and DRO levels of up to 630 ppm within soil samples collected from the UST excavation. Based on the results of the UST removal monitoring services, it was recommended that this Phase II Environmental Site Assessment be performed to evaluate the extent of the petroleum release within the on-site soils and possibly groundwater.

Copies of the Underground Petroleum Product Tank Inventories for both the recently removed tanks and the tanks removed in September of 1985 are enclosed as Appendix 1 of this report. Copies of the Underground Petroleum Tank Inventory Forms were also forwarded to the Wisconsin Department of Industry, Labor and Human Relations (WDILHR) under separate cover. In addition, due to the conditions encountered, the Wisconsin Department of Natural Resources (WDNR) Southeast District Headquarters were notified of the conditions encountered.

3.0 SUBSURFACE EXPLORATION AND CONDITIONS

3.1 Subsurface Exploration

The subsurface exploration was performed on November 7, 12, and 13, 1991, and consisted of boring eleven (11) test borings to depths ranging from 16 to 21± feet below the existing ground surface and the installation of three (3) groundwater monitoring wells. Boreholes were placed throughout the site in areas occupied by the former Standard Oil service station and at possible tank locations associated with the former service station location. Upon completion of the boring and sampling operations, the boreholes where groundwater monitoring wells were not installed, were backfilled with chipped bentonite, in accordance with Wisconsin Administrative Code Chapter NR 112 for borehole backfilling procedures, and surface patched with Portland Cement concrete. Borehole Abandonment Forms are enclosed with this report as Appendix 2. It should be realized, however, that caving and/or settling of the backfill materials may occur with changing moisture conditions. Further backfilling or maintenance of the borehole by the client or property owner may be required.

A copy of the Boring and Monitoring Well Location Plan (Map 5) and Test Boring Logs (Records of Subsurface Exploration, Appendix 3) are enclosed with this report. The test boring elevations shown on the test boring logs were determined using conventional instrument survey techniques reference to the benchmark (City of Milwaukee Standard Benchmark No. 74-01) indicated on Map 5 and are considered accurate to within 0.01± foot.

The subsurface exploration included performing test borings utilizing a 3¼ inch inside diameter hollow stem auger and Standard Penetration Tests (SPT) in general accordance with ASTM D-1586 specifications (at 2½ foot intervals) to the maximum depths explored. All boring equipment and sampling apparatus were properly cleaned before, during, and after the boring and sampling operations. A description of the decontamination procedures is included as Table 1. Soil samples were classified in the laboratory in general accordance with the Unified Soil Classification System (ASTM D-2488-75). The soil parameters indicating the engineering characteristics of the materials encountered in the test borings, as determined by the field testing, are presented on the Test Boring Logs enclosed as Appendix 3 of this report with the terms and symbols defined on the General Notes insert enclosed with this report.

Upon completion of the drilling operations, groundwater monitoring wells were installed in Test Boring Nos. MW1, MW2 and MW3 to allow sampling of the groundwater to determine the groundwater quali-

ty with respect to the presence of petroleum hydrocarbon compounds. The groundwater monitoring wells consist of 2 inch diameter, 0.010 inch machine slotted PVC flush threaded screen at the bottom portion of the wells with 2 inch diameter unslotted PVC risers extending to the ground surface. Washed silica sand was utilized as a filter medium in the annular space between the slotted section of the PVC pipe and the borehole. A wetted Bentonite seal was placed on top of the filter medium to reduce the potential of down-hole migration of surface waters into the sampling zone. The portion of the annular space extending from the Bentonite seal to the ground surface was filled with Portland Cement concrete. The top of the wells were secured with a protective locking cap and steel flush cover to protect the wells from both vandalism and disturbance. A copy of the WDNR Monitoring Well Construction form for each well is included as Appendix 4 of this report and cross-sections of the wells are included as Figures 3, 4, and 5.

The groundwater monitoring wells were developed using a bailing method until the removed groundwater was relatively free of suspended fines. Following proper development, water samples were obtained from each groundwater monitoring well using a properly cleaned Teflon® bailer. The groundwater samples were retained and properly preserved with hydrochloric acid in new, properly labeled and laboratory approved, 40 milliliter (ml) glass vials with Teflon® septa for chemical analysis for Volatile Organic Compounds (VOCs); amber gallons for Diesel Range Organics (DRO) and Polynuclear Aromatic Hydrocarbons (PAH) chemical analysis and 250 milliliter bottles (which were field filtered and preserved with nitric acid) for lead and cadmium analysis. The samples were transported to the GEA laboratory in a controlled environment to preserve the testing accuracy and transported to the analytical laboratory by a representative of the subcontracted analytical laboratory.

3.2 Subsurface Conditions

The subsurface exploration indicates that the existing pavement consists of approximately 2 to 4± inches of asphalt over 6 to 9± inches of gray brown to gray silty fine to coarse sand and gravel base course. An exception was at the location of Test Boring No. B3 within the recently backfilled UST excavation where no pavement was present. Underlying soils then generally consist of existing fill varying from brown to gray brown silty fine to coarse sand and gravel with probable concrete and asphalt rubble to brown silty fine sand, brown silty clay, and brown to gray silt to silty clay extending to depth ranging from 4½ to 11± feet below existing grade. The deepest fill depths were encountered within the former underground storage tank area and in northwest corner of the site. It is anticipated

that void spaces associated with concrete rubble backfill are also present within the former UST excavation area. Possible fill soils consisting of brown clayey silt were encountered below the existing fill at the location of Test Boring No. B8 extending to a depth of 9± feet. Underlying naturally occurring soils then generally consist of light brown clayey silt to silty clay extending to depths ranging from approximately 7 to 12± feet; over generally gray silty clay with occasional layers and lenses of silt to clayey silt extending to a depth of approximately 19± feet; over brown gray silty fine sand extending to at least the maximum depth explored, 21± feet. Possible cobbles and boulders were also located within the deeper naturally occurring soils.

Soil encountered at the location of Test Boring Nos. B1, B2 and MW1 between depths ranging from approximately 2 to 13½± feet below existing grade were considered to exhibit slight to strong petroleum odors. These borings were located in the immediate vicinity of the former underground storage tank area. In addition, the soil sample collected from Test Boring No. B7, performed in the vicinity of the former pump island area, was considered to exhibit a slight possible petroleum odor at a depth of 4½ to 6± feet. No noticeable odors were encountered in the remaining soil samples collected. The results of the relative odor observations are indicated in the ROL column of the enclosed Test Boring Logs (Appendix 2).

Free water was encountered during the subsurface exploration at depths ranging from approximately 6 to 12± feet below existing grade. Groundwater depths within the groundwater monitoring wells were monitored on two separate occasions and free water was encountered at depths ranging from approximately 4¼ to 5¼± feet below existing grade at the location of Monitoring Well Nos. MW1 and MW2 and at a depth ranging from approximately 7 to 8± feet below existing grade at the location of Monitoring Well MW3. The results of the groundwater monitoring is summarized in Table 2 enclosed with this report. Based on the observed water level readings, soil coloration and relative moisture content of the collected soil samples, the long term hydrostatic water table is anticipated to exist at a depth of approximately 7 to 9± feet below the existing ground surface. The shallower groundwater levels encountered within the vicinity of the former underground storage tank area are anticipated to represent perched water conditions. Due to the variable groundwater depths encountered within the groundwater monitoring wells, an accurate groundwater gradient could not be determined at this time. Groundwater levels are considered to be capable of fluctuating seasonally, especially during periods of heavy precipitation.

The above described surface conditions have been simplified for ease of report interpretation. A more detailed description of the subsurface conditions at the actual test boring locations are described on the Test Boring Logs enclosed in Appendix 2 of this report. Groundwater monitoring well data is included as Table 2 of this report.

3.3 Geologic Logs and Well Construction Reports

To further assist in determining regional subsurface conditions in the area of the subject site, geologic logs and well construction reports were obtained from the University of Wisconsin Extension - Wisconsin Geological and Natural History Survey. Copies of the nearest well construction reports are included as Appendix 8 of this report.

A review of the well construction reports indicates subsurface conditions to generally consist of clay soils to depths ranging from 20 to 48± feet, sand and gravel to 35 to 65± feet, weathered bedrock to 42 to 71± feet and limestone bedrock to up to 90± feet. Groundwater was present at depths ranging from 16 to 45± feet.

4.0 VOLATILE VAPOR SCAN AND ANALYTICAL TESTING

4.1 Volatile Vapor Scan and Results

Split soil samples were obtained from the SPT for classification, volatile vapor scans, and analytical testing. The collected soil samples were placed in new, laboratory approved glass sampling jars with Teflon® coated lids. The soil samples collected for analytical testing were placed in 4 ounce sampling jars, sealed, and placed in a cooler. One of each set of the split soil samples (collected in 8 ounce sampling jars) was also subjected to a head-space volatile vapor scan using a properly maintained and charged 11.7 eV Photoionization Detector (HNU Model No. PI-101) calibrated to a Benzene standard (HNU span gas Part No. 101-350). The volatile vapor scan technique is a screening method used to evaluate the presence of certain potentially hazardous compounds such as petroleum hydrocarbon compounds. The head-space sample containers were filled 1/2 to 3/4 full, covered, and allowed to warm to approximately room temperature prior to the vapor scans. The head-space samples were also agitated for 30± seconds prior to the vapor scan. The HNU was calibrated before, during and after the volatile vapor scans.

The results of the volatile vapor scan indicated measurable concentrations of volatile vapors (ranging from 3 to 220 HNU units) within the test borings performed within the immediate vicinity of the former underground storage tank location (Test Boring Nos. B1, B2, B3 and MW1). In addition, a measurable concentration (50 HNU units) was encountered at a depth of 4½ to 6± feet at the location of Test Boring No. B7 (in the former pump island area). Soil samples collected from the remaining test boring locations were considered to exhibit low (ranging from 1 to 6 HNU units) to no detectable concentrations of volatile organic vapors. The results of the volatile vapor scans are summarized as Table 3 and are indicated on the Test Boring Logs enclosed as Appendix 3 of this report.

4.2 Chain-Of-Custody Procedures

Ten (10) soil samples and a groundwater sample from each groundwater monitoring well were submitted to a subcontracted, WDNR-accredited analytical laboratory for chemical testing. The sample collection, storage and transportation was performed in general accordance with ASTM and other applicable specifications, and at all times followed standard "Chain-Of-Custody" requirements. The select soil samples were analyzed for the presence and concentration levels of GRO, DRO, VOCs, PVOCs, PAHs, Lead and Cadmium as described earlier in accordance with the LUST analytes for soils affected with unknown petroleum as described in the WDNR LUST Analytical Guidance manual

(June, 1991). Based on the results of the total lead testing, the sample from Test Boring No. 2 with an elevated Total Lead concentration was tested for lead using the Toxicity Characteristic Leaching Procedure (TCLP). The collected groundwater samples were analyzed for the presence and concentration levels of DRO, PAH, VOCs, Lead and Cadmium in accordance with the LUST analytes for groundwater affected with unknown petroleum as described in the WDNR LUST Analytical Guidance manual (June, 1991). The soil and groundwater samples Chain-of-Custody forms are enclosed as Appendix 5 of this report.

4.3 Results of Analytical Testing

4.3.1 The results of the analytical testing for the presence of DRO and GRO indicate that detectable levels of both GRO (16.4 ppm) and DRO (15.4 ppm) concentrations were measured within the soil sample tested from Test Boring No. B2 (4½ to 6± feet). In addition, a measurable DRO concentration (16.1 ppm) was measured within the soil sample from Test Boring No. B1 at a depth of 7 to 8½± feet. No measurable concentrations (less than 10 ppm) were measured within the remaining soil samples tested. GRO and DRO test results are summarized in Table 4, enclosed with this report.

The results of the PVOC (and VOC testing on one soil sample) indicate that measurable concentrations of VOCs were present within the soil samples tested from Test Boring Nos. B1, B2 and MW1 in the vicinity of the former UST area. In addition, the soil sample tested from Test Boring No. B7 (in the vicinity of the former pump island area) exhibited measurable concentrations of several of the PVOC compounds. PVOC analytical test results are summarized in Table 5 enclosed with this report.

Detectable concentrations of Total Lead and Cadmium were encountered in each of the soil samples tested. An additional analysis for leachable lead (using the Toxicity Characteristic Leaching Procedure) indicated no detectable concentration of TCLP Lead. Lead and Cadmium analytical test results are tabulated in Table 6, enclosed with this report.

The results of the PAH testing on one representative soil sample from Test Boring No. B2 (4½ to 6 feet) indicated measurable concentrations of Fluorene (200.0 ppb), Benzo(a)anthracene (50.0 ppb) and Benzo(a)Pyrene (200.0 ppb) were measured within the soil sample tested. These compounds can typically be associated with diesel fuel, fuel oil or waste oil. A summary of the PAH testing is included as Table 7, enclosed with this report.

The results of the various chemical testing of the soil samples on the subcontracted analytical laboratory letterheads is enclosed as Appendix 5 of this report.

4.3.2 The results of the VOC testing on the submitted groundwater samples indicates that the groundwater samples from Monitoring Well Nos. MW1 and MW2 (in the vicinity of the former UST area) contained a measurable concentrations of Benzene (4 and 6 parts per billion, respectively) and a measurable concentration of Ethylbenzene (4 parts per billion) in the groundwater from Monitoring Well No. MW2. In addition, the groundwater sample from Monitoring Well MW3 had measurable concentrations of 1,1,-Dichloroethene (3.0 ppb), cis-1,2-Dichloroethene (3.0 ppb), Methylene Chloride (31.0 ppb), Toluene (5.0 ppb) and ter-Butyl methyl ether (24.0 ppb). The detected Benzene level from Monitoring Well No. MW2 (6 ppb) exceeds the current WDNR Enforcement Standards (5.0 ppb) as expressed in the Groundwater Quality Standards of the Wisconsin Administrative Code Chapter NR 140. In addition, the Benzene concentration in Monitoring Well No. MW1, and the Methylene Chloride concentration in MW3 exceed the Preventive Action Limit for these compounds (0.067 ppb for Benzene and 15 ppb for methylene chloride) as expressed in Chapter NR 140 of the Wisconsin Administrative Code and the concentration of ter-Butyl methyl ether in Test Boring No. MW3 exceeds the proposed Preventive Action Limit for this compound (12 ppb).

The results of the PAH, DRO, Cadmium and Lead testing on the collected groundwater samples indicated no detectable concentrations of the compounds included in the analyses.

The results of the chemical testing of the groundwater samples, as provided by the subcontracted analytical laboratory, are provided as Appendix 6 of this report.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the subsurface exploration, field testing and analytical testing performed on the collected soil and groundwater samples, in conjunction with the results of the previous UST removal monitoring services (GEA Project No. E-911014) GEA formulates the following conclusions and recommendations pertaining to the Tolkan Leasing Company property for which this Phase II Environmental Site Assessment was performed:

1. Based on the results of the analytical testing performed to-date, soils in the immediate vicinity of the former gasoline, fuel oil and waste oil UST area are considered to have been affected by petroleum hydrocarbon compounds at levels above current WDNR clean-up guideline levels (10 ppm). The soils in the vicinity of the former UST area appear to be affected with petroleum hydrocarbon compounds to depths ranging from approximately 7 to 14± feet below existing grade in the former UST area. Soils in the vicinity of the former pump island area (Test Boring No. B7) are also considered to have been affected with petroleum hydrocarbon compounds, however, not at concentrations that would require remediation at this time. A plan view of the approximate lateral extent of the petroleum affected soils is included as Map 6 of this report.

2. The results of analytical testing on the collected groundwater samples indicates that groundwater in the vicinity of the former UST area is affected with Benzene concentrations at concentrations slightly below (4 ppb) and slightly above (6 ppb) the current Enforcement Standard for Benzene utilized by the WDNR (5 ppb). In addition, groundwater in the vicinity of Monitoring Well No. MW3 contained measurable concentrations of Methylene Chloride and ter-Butyl methyl ether at concentrations above current Preventive Action Limits (PAL) either utilized or proposed by the WDNR. Based on the recommended soil remediation procedure discussed in the following sections of this report, it is anticipated that the majority of the affected groundwater would be removed during soil remediation procedures. However, additional post treatment analysis of groundwater following the remediation procedures is considered to be necessary to evaluate the effectiveness of the clean-up activities on groundwater quality. Dependent upon the results of the further groundwater analysis, additional treatment of the groundwater may be necessary.

3. On the basis of the services performed to date, an estimate of approximately 700 to 800± cubic yards of petroleum affected soils are anticipated to require remediation. Due to the anticipated extent of affected soils, an in-situ remediation system such as a soil venting system is not anticipated to be feasible for the subject site. The most appropriate remediation alternate is therefore considered to consist of removal of the petroleum affected soils and any groundwater which collects within the removal excavation and disposal off-site at an approved licensed sanitary landfill. Approval from a sanitary landfill (Parkview Recycling and Disposal Facility in Menomonee Falls, Wisconsin) is recommended to be obtained prior to disposal. In order to obtain approval, a soil sample will need to be obtained and submitted to a subcontracted analytical laboratory to perform a waste characterization on the soil to allow for the proper paperwork to be submitted for acceptance of the soil by the landfill.

4. Based on the relatively shallow groundwater table and due to the anticipation that perched water tables are present on the site, significant dewatering of the removal excavation is anticipated to be necessary. It is therefore recommended that additional sampling and analysis of the groundwater be performed to determine if groundwater can be removed from the removal excavation and disposed directly into the Milwaukee Metropolitan Sewerage District (MMSD) System. If testing indicates that direct disposal into the MMSD sanitary sewer system cannot be performed then collection of groundwater from the removal excavation and appropriate disposal will be necessary.

5. Upon completion the above recommended remediation alternatives, post treatment evaluation of the groundwater on the subject site due to the encountered conditions is recommended. It is also anticipated that due to the fact that several of the VOC compounds detected exceed the Preventive Action Limits currently utilized by the WDNR that periodic monitoring of the groundwater on the subject site may be required by the WDNR.

6. Based on the results of the subsurface exploration and visual observation at the time of UST removal, it is anticipated that voids may be present within the concrete rubble backfill apparently used to backfill a portion of the former UST area. Extreme care must be utilized during overexcavation activities due to the potential for instability. Removal will also take place in close proximity to the existing struc-

ture on the subject site and a structure on the property to the south. Care must also be utilized during excavation procedures not to affect the support of the structures.

7. In accordance with Chapter NR 140.14 of the Wisconsin Administrative Code, a copy of this report is recommended to be forwarded to the Wisconsin Department of Natural Resources (WDNR) Southeast District Headquarters as written compliance with the Wisconsin Administrative Code. GEA can forward a copy of this report to the WDNR based upon approval of the client.

8. Currently, a Petroleum Environmental Clean-up Fund (PECFA) is available, for which this site is anticipated to be eligible, from the Wisconsin Department of Industry, Labor and Human Relations (WDILHR) to assist in the cost for clean-up caused by releases of petroleum tank systems. Under PECFA, the WDNR and WDILHR has the responsibility of reviewing and accepting remedial action activities and determining if the actions are in accordance with hazardous spill laws under Section 144.76 of the Wisconsin State Statues. In accordance with GEA interpretation of these laws, it is recommended that copies of this report be forwarded to the WDNR at the following address:

WDNR
2300 North Dr. Martin Luther King, Jr. Drive
P.O. Box 12436
Milwaukee, WI 53212
Attn: Mr. John Feeney

Further, a copy of the report is also recommended to be forwarded to the WDILHR at the following address:

WDILHR
Bureau of Petroleum Inspection and Fire Protection
P.O. Box 7969
Madison, WI 53707
Attn: Mr. Russell Haupt

6.0 GENERAL COMMENTS

This report has been prepared for the exclusive use of Tolkan Leasing Company and may not be reproduced or distributed without written authorization from Giles Engineering Associates, Inc. or Tolkan Leasing Company.

This report has been prepared in order to aid in the evaluation of the Tolkan Leasing Company, Inc. (subject property), located at 4301 West Good Hope Road in the City of Milwaukee, Milwaukee County, Wisconsin, with regard to the potential for the presence of petroleum hydrocarbon compounds at the time of this study. No other intent is considered. The conclusions presented in this report were based on available information pertaining to various points in time and were presented by others for use by GEA or were based on informal discussions with various agency personnel.

The conclusions in this report may rely on others credibility and, therefore, an alteration in documentation or verbal information obtained may result in the redirection of the conclusions presented in this report. The conclusions are also based on visual field observations performed within the property boundaries at this specific point in time and, therefore, do not include the potential for hazardous substances present within undocumented fills placed on the subject site or adjacent properties.

Soil samples collected from the subsurface exploration will be retained for a period of 30 days. If no other instruction is received, they will be disposed.

This report has been prepared in accordance with generally accepted practice in the field of Geoenvironmental consulting at the time of report preparation. No other warranty is either expressed or implied.

APPENDIX

The boring logs and related information enclosed in the appendix depict subsurface conditions only at the specific locations drilled and at the particular times designated on the logs. Soil conditions at other locations may differ from conditions occurring at these boring locations. Also the passage of time may result in a change in the soil conditions at the boring locations drilled.

UNDERGROUND STORAGE TANKS CLOSURE AND REMOVAL ASSESSMENT
AND
PRELIMINARY PETROLEUM HYDROCARBON ASSESSMENT STUDY

TOLKAN LEASING COMPANY
4301 WEST GOOD HOPE ROAD
MILWAUKEE, WISCONSIN
GEA PROJECT NO. E-911014

1.0 EXECUTIVE SUMMARY

Underground Storage Tanks (USTs) Closure and Removal Assessment services were performed by Giles Engineering Associates, Inc. (GEA) for two USTs removed from the Tolkan Leasing Company Property, located at the street address of 4301 West Good Hope Road, in the City of Milwaukee, Wisconsin. The services were performed by GEA in accordance with the Wisconsin Department of Industry, Labor, and Human Relations (WDILHR) and Wisconsin Department of Natural Resources (WDNR) UST closure and removal assessment requirements and were based on Tolkan Leasing Company approval of GEA Proposal No. EP-910920, dated September 13, 1991.

One (1) 550± gallon waste oil UST and one (1) 1,000± gallon fuel oil UST were removed from the subject property on October 14, 1991. North Shore Excavating, Inc. provided the tank removal, soil excavation, product removal, tank cleaning, and sludge disposal services; and Giles Engineering Associates, Inc. provided the tank closure and removal assessment services. Mr. Timothy J. Temperley, a representative of the of the City of Milwaukee Building Inspection Department, was present during portions of the UST removal, soil excavation, and material sampling activities.

Petroleum-affected soils were encountered within the excavation following removal of the fuel oil UST. Slight to strong petroleum odors were noted in the soil samples collected during material sampling activities. In addition, moderate to high vapor levels were measured in several of the soil samples collected and subjected to a vapor analysis utilizing a HNU Model PI 101 Photoionization Detector (PID) equipped with a 11.7 eV lamp and calibrated to a Benzene standard. Measured vapor levels, ranging from 30 to 300 HNU units, were detected by the PID in soil samples collected from the fuel oil UST excavation. Low (2 HNu units) to no detectable vapor levels were measured with the PID in soil samples collected from the waste oil UST excavation.

Four (4) select soil samples were submitted to a subcontracted analytical laboratory for chemical testing; two (2) samples collected from the waste oil tank excavation were submitted for analysis for Total Recoverable Petroleum Hydrocarbons (TRPH), and two (2) samples collected from the fuel oil tank excavation were submitted for analy-

sis for Gasoline Range Organics (GRO) and Diesel Range Organics (DRO). Results of the analytical testing performed on the select soil samples indicate GRO levels of up to 44 parts per million (ppm) and DRO levels of up to 630 ppm were present within the soil samples collected and tested from beneath the former fuel oil UST.

Based on the results of the UST Removal Monitoring Services and Preliminary Petroleum Hydrocarbon Assessment Study a petroleum release from the USTs is considered to have occurred. It is, therefore, recommended that additional exploration and analysis be performed to evaluate the extent of the petroleum presence within the on-site soils and possibly groundwater. GEA can provide a proposal to provide these services.

In accordance with NR 140.14 of the Wisconsin Administrative Code, the owner or operator of the facility, at which a standard is attained or exceeded, should notify the appropriate regulatory agency that a standard has been attained or exceeded. Therefore, a copy of this report is recommended to be forwarded by the property owner to the Wisconsin Department of Natural Resources Southeast District Headquarters, as written compliance with the Wisconsin Administrative Code. In addition, to maintain eligibility under the Petroleum Environmental Clean-Up Fund Act (PECFA), a copy of this report is recommended to be forwarded to WDILHR.

2.0 SITE BACKGROUND

2.1 Introduction

It was requested by Tolkan Leasing Company that Underground Storage Tanks (USTs) Closure and Removal Assessment services be performed by Giles Engineering Associates, Inc. (GEA) for a 550± gallon waste oil UST and a 1,000± gallon fuel oil UST located on the subject property. The underground storage tanks associated with the subject property are not currently registered with the Wisconsin Department of Industry, Labor, and Human Relations (WDILHR).

2.2 Site Location

Tolkan Leasing Company is located on the southwest corner of North 43rd Street and West Good Hope Road, and is referenced by the street address of 4301 West Good Hope Road in the City of Milwaukee, Wisconsin. The subject property is located in the northeast one-quarter of the northeast one-quarter of U.S. Public Land Survey Section No. 23, Township 8 North, Range 21 East. The generalized location of the subject site is shown on Maps 1 and 2 enclosed with this report.

2.3 Site Description

The subject site is currently occupied by the Tolkan Leasing Company facility which consists of a one-story structure with a surrounding asphaltic concrete parking lot. It is understood that the structure was previously used as an Amoco service station facility which was constructed in the late 1960's. The site was occupied by another service station and a private dwelling with a garage prior to the Amoco service station.

The two existing USTs associated with the subject property were located near the southeastern corner of the Tolkan Leasing Company facility. A fuel line which was left in-place during the tank removal extends from the waste oil UST approximately 45± feet westward to a drain in the service area of the existing building. Three underground storage tanks associated with the former Amoco service station are understood to have been removed 5 to 6± years ago. These tanks consisted of two 6,000 gallon USTs and one 8,000 gallon UST which are understood to have been used to store gasoline. The approximate location and components of the two USTs removed on October 14, 1991 on the subject property are shown on Map 3 enclosed with this report. The location of the USTs and other site features associated with the former Amoco service station are indicated on Map 4.

3.0 UNDERGROUND STORAGE TANK REMOVAL SERVICES

3.1 Tank Removal and Soil Excavation

North Shore Excavating, Inc. of Mequon, Wisconsin was on site to provide tank removal services and the excavation of overburden and petroleum-affected soils. The two (2) existing USTs were subsequently removed and placed on a synthetic plastic liner at the ground surface. No holes or pitting were observed on the 550± gallon waste oil UST; however, a liquid was observed leaking from one of several holes in the 1,000± gallon fuel oil UST. The overburden soils and soils which were excavated from the sidewalls and bottom of the associated tank area were initially placed adjacent to the excavation, and were subsequently placed back into the excavation pit after the removal of the UST systems. Backfilling was performed to allow access to the area.

3.2 Tank Cleaning and Sludge Residue Removal

After the USTs were removed from the tank pit area, an opening was cut on the side of each tank and the sludge associated with each tank was subsequently removed. The sludge was placed in a labeled and secured 55± gallon drum. After the majority of the sludge was removed an absorbant material was spread on the bottom of the tank to absorb the remaining sludge. The absorbant material was removed and properly disposed. The 55± gallon drum remains on the subject site pending receipt of a USEPA Notification of Regulated Waste Activity number. It is understood that the contents of the 55± gallon drum will be disposed by North Shore Excavating, Inc. following receipt of the USEPA generator number. Upon completion of the tank cleaning activities, North Shore Excavating, Inc. dismantled and removed the tanks from the subject site.

4.0 SAMPLE COLLECTION AND VOLATILE VAPOR SCAN

4.1 Soil Collection

Split soil samples were collected by GEA in new, laboratory approved, 4 ounce glass sampling jars with Teflon® coated lids, and 8 ounce glass sampling jars with metal lids from the bottom and side walls of the excavation at locations where petroleum odors and/or staining were observed. The soil samples collected for analytical testing were immediately sealed and placed in a cooler. No head space remained in the soil sample jars collected for analytical testing. The soil sampling locations in the UST excavation are shown on Map 5 enclosed with this report. Sampling locations and sample classifications are also described on Table 1, GEA Material Sampling Field Log.

4.2 Volatile Vapor Scan

One of each set of the split soil samples was subjected to a head space vapor analysis utilizing a properly calibrated and charged 11.7 eV Photoionization Detector (HNU Model No. PI-101) calibrated to a benzene standard (HNU span gas part No. 101-350). The head space sample containers were filled one-half to three-quarters full with soil, covered, and allowed to equilibrate in the GEA laboratory (at an ambient air temperatures of 70± degrees) prior to analysis. The head space samples were agitated for 30± seconds prior to the analysis.

The results of the vapor analysis indicated that moderate to high levels of volatile organic compound vapors (up to 300 HNU-units) were encountered in the soil samples collected from the north, south and east sidewalls, and the bottom of the fuel oil UST portion of the excavation. Low to non-detectable levels of volatile organic compound vapors (up to 2 HNU-units) were measured in the remainder of soil samples collected from the west side wall and at the bottom of the waste oil UST portion of the excavation. The soil sample reference numbers, depths, classification, and results of the vapor analyses are shown on Table 2 (Material Sampling Field Log) enclosed with this report. The approximate extent of the excavation, sampling locations and sampling reference numbers are shown on Map 5, enclosed with this report.

5.0 ANALYTICAL TESTING

5.1 Chain-of-Custody Procedures

Four (4) soil samples obtained from the excavation were submitted for analytical testing in a subcontracted analytical laboratory. The chemical analyses included an analysis for the determination of the presence and concentration levels of Total Recoverable Petroleum Hydrocarbons (TRPH) in two samples taken from the waste oil UST portion of the excavation and Gasoline Range Organics (GRO) and Diesel Range Organics (DRO) in two samples taken from the fuel oil UST portion of the excavation.

A standard Chain-of-Custody record was completed and accompanied the selected and labeled soil samples. The purpose of the chain-of-custody record was to ensure that the quality of the samples were maintained during transportation, storage, and analysis. A copy of the Chain-of-Custody is included as Appendix 2. The soil samples were packed in a cooler along with the chain-of-custody record and transported to a WDNR accredited analytical laboratory.

5.2 Results of Analytical Testing

The test results indicate that non-detectable concentration levels of TRPH were encountered in the soil samples collected from next to and beneath the former waste oil UST. However, test results indicated concentration levels of DRO as high as 630 parts per million (ppm), and GRO levels as high as 44 ppm, within soil samples collected from beneath and adjacent to the former fuel oil UST. The concentration levels encountered are above the Wisconsin Department of Natural Resources (WDNR) remediation guidelines of 10 ppm for DRO and GRO.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the vapor analysis and analytical testing performed on soil samples collected during the underground tank removal procedures, and the information collected and reviewed to-date, Giles Engineering Associates, Inc. (GEA) formulates the following conclusions and recommendations pertaining to the subject property for which this Underground Storage Tank Closure and Removal Assessment and Preliminary Petroleum Hydrocarbon Assessment Study was performed.

1. Petroleum-affected soils were encountered within the excavation following the UST removal. Obvious odors and/or discolorations, potentially indicative of petroleum hydrocarbon presence, were observed in several soil samples collected following the UST removal. In addition, moderate to high volatile organic vapor levels were detected utilizing a HNU Model PI 101 Photoionization Detector (PID) in several soil samples collected during the UST removal procedures.

2. Based on the results of the analytical testing performed on the soil samples collected during the UST removal, fuel oil appears to have leaked into the soil of the subject site. In addition, gasoline hydrocarbons, likely from the former gasoline USTs located on the subject site has also affected the soils of the subject site.

3. Based on the information collected for this project, it is recommended that a Petroleum Hydrocarbon Assessment Study be performed on the subject site to evaluate the vertical and lateral extent of the petroleum hydrocarbon-affected soil and possibly groundwater. The subsurface exploration is recommended to consist of performing ten (10) test borings across the subject site with the installation of three (3) groundwater monitoring wells. The subsurface exploration recommended herein will be used to evaluate the extent of petroleum-affected soils, the potential for the presence of petroleum hydrocarbons in the groundwater of the site, an indication of the direction of groundwater flow in the vicinity of the subject site and to determine the most appropriate remediation techniques. Select soil and groundwater samples would be submitted to a subcontracted, WDNR accredited, analytical laboratory and tested for the presence and concentration levels of Gasoline Range Organics (GROs), Petroleum Volatile Organic Compounds (PVOCs), and lead. A proposal for the additional subsurface exploration and professional consulting services can be forwarded by GEA upon your request.

4. The subject site may be eligible to receive funding from the Petroleum Environmental Clean-up Fund (PECFA) of the Wisconsin Department of Industry, Labor and Human Relations (WDILHR) to assist in the cost for clean-up caused by releases of petroleum tank systems. Under PECFA, the WDNR has the responsibility of reviewing and accepting remedial action activities and determining if the actions are in accordance with hazardous spill laws under Section 144.76 of the Wisconsin State Statues. In accordance with GEA interpretation of these laws, it is recommended that the current property owner notify the Wisconsin Department of Natural Resources (WDNR) Southeast District Office at the earliest opportunity. Copies of this report are recommended to be forwarded to the WDNR at the following address:

   WDNR
   2300 North Dr. Martin Luther King, Jr. Drive
   P.O. Box 12436
   Milwaukee, WI 53212
   Attn: Ms. Giselle Red

Further, a copy of the report is also recommended to be forwarded to the WDILHR at the following address:

WDILHR
Bureau of Petroleum Inspection and Fire Protection
P.O. Box 7969
Madison, WI 53707
Attn: Mr. Russel Haupt

Eligibility for PECFA funding requires that the USTs be registered with the Wisconsin Department of Industry, Labor and Human Relations (WDILHR). UST registration forms for the USTs removed on October 14, 1991 and for the previously removed USTs are enclosed as Appendix 3 of this report, and copies of the UST registration forms are being sent to WDILHR under separate cover.

7.0 GENERAL COMMENTS

The soil samples obtained during the subsurface exploration will be retained for a period of thirty days. If no instructions are received, they will be disposed of at that time.

This report has been prepared in order to aid in the evaluation of this property with regard to the potential for petroleum hydrocarbons in the subsurface soils at the time of this study. The information presented in this report is based on field observations and sampling of soil performed within and adjacent to the property boundaries at specific locations at a specific point in time. The opinions formulated regarding the hazardous substances encountered on this property are based upon reasonable judgements made in light of this information and the data obtained from the specific site.

The information presented in this report may affect the value of the proposed site, and is considered confidential. Release of the report and/or information contained herein must be carefully considered and should not be performed without consent of Giles Engineering Associates, Inc. and Tolkan Leasing Company. Disclosure of known site environmental concerns to the regulatory agencies or other parties should generally be done by the owner or with written authorization from the owner. This report has been prepared for exclusive use by Tolkan Leasing Company.

The conclusions and recommendations presented in this report have been promulgated in accordance with the WDILHR and WDNR Closure and Removal Assessments, and with generally accepted professional engineering practice in the field of geotechnical and geo-environmental engineering at the time of this report. No other warranty is either expressed or implied.

The site is identified on the UST, LUST (03-41-000639), EDR Historical Auto, and WI WRRSER database. Based on field reconnaissance, the site is currently occupied by a Midas Auto & Tire. Review of the Milwaukee County GIS & Land Information Interactive Map online indicates the site is owned by KNG Investments, LLC[Ref.1].

According to the Wisconsin Department of Agriculture, Trade and Consumer Protection (DATCP) Storage Tank Database five tanks are registered to the site address 7168 N. 43rd Street [Ref. 2]. In October 1989, one 4,000-gallon and two 6,000-gallon unleaded gasoline UST and one 4,000-gallon leaded gasoline UST were closed / removed. In May 2005, one 1,000-gallon fuel oil UST was closed / removed. The occupancy for all tanks is listed as 'retail fuel sales'.

According to the EDR report, no Sanborn Map coverage is available for the project corridor.

Himalayan's review of historical aerial photographs indicates the site was occupied by a residential building since the 1930s. By the 1960s, the building was razed and a commercial building was two pump island was developed. The service station was then razed in the 1990s and remained a vacant lot until 2000 when a commercial building was developed. The site has remained the same for over 20 years.

BRRTS #03-41-000639: Based on the report by Northern Environmental Technologies, Inc. (NET), the site was a self-service filling station andhas had a historical hazardous release east of the site near the apartment complex since 1972. All tanks at the site were removed in 1989 and additional contamination was found [Ref. 3]. According to NET, approximately 12,000 tons of impacted soil was removed from the site and were transported off-site to a sanitary landfill in 1990. Prior to backfilling with clean material, 36 confirmation samples were collected from bottom and sidewalls of the excavation at depths ranging from 2 to 16 feet bgs. Confirmation samples were analyzed for total hydrocarbon petroleum (TPH), PVOCs, and total lead [Ref.3].

Based on the NET report, between February 1994 through June 1994, ten borings (B200, B300, B400, B500, B800, B900, B1000, B1200, B1300, B1400) were advance with a maximum depth of 16 feet bgs. Three borings were converted into monitoring wells (MW100, MW200, MW300). An on-site sump (SUMP) near the former USTs was also installed. Soil and groundwater samples were analyzed for PVOCs and GRO [Ref.3].

According to NET, one boring off-site (B500) had benzene exceeding the WDNR Interim Cleanup Guidelines. Additional borings (B800, B900, B1000, B1200, B1300, and B1400) were advanced off site to determine the extent of contamination. All soil samples from these borings had no petroleum detectsand no PVOC concentrations in groundwater were above their NR PAL

except for the final on-site sump sample. NET concluded that petroleum contamination remains on-site and ground impacts are below NR 140 ES. The LUST case was conditionally closed by the WDNR in September 1994 with a barrier maintenance plan and soil vapor monitoring near the adjacent apartment building [Ref.3].

Geology / Hydrogeology

Based on NET's report, soil at the site mainly consisted of at least 16 feet bgs of silt underlain by 2 feet bgs of silty clay. Depth to groundwater was approximately 6 to 15 feet bgs and estimated to flow easttoward residential properties [Ref.3].

Based on the USDA NRCS soil survey report, soils along the project corridor consists of Unmapped Area (UA). Unmapped Area is generally described as areas where development activities have either covered over or removed the original solum of the soil, therefore, native soil conditions are no longer present within the project corridor [Ref.4]

Soil Impacts

According to NET, most soil samples from the initial site investigation and remediation activity in 1990 had detectable PVOCs and TPH concentrations. However, mostsamples had PVOCs and TPH concentrations below their respective NR 720 RCLs. Several confirmation samples (S902, S911, S610, S604) collected from 2.5 to 6.5 feet bgs had TPH (11 to 743 mg/kg), benzene (800 to 1,480 µg/kg), ethylbenzene (6,310 to 20,300 µg/kg), toluene (1,480 to 3,390 µg/kg),xylenes (21,000 to 81,800µg/kg), and lead (56.3 to 94 mg/kg) concentrations exceeding their respective NR 720 RCLs.

It appears that the closest residual soil contamination (S911, S610)is approximately 80 feet from the N 43rd Street and W. Good Hope Road intersection

Groundwater Impacts

Based on the most recent groundwater sampling event in June, 1994, only SUMP had a benzene concentration (2ug/L) exceeding its NR 140 PAL.

It appears that the closest residual groundwater contamination is approximately 150 feet from the N 43rd Street and W. Good Hope Road intersection

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site.

Recommendations

Considering that soil and groundwater contamination remaining on site is below their respective NR 720 RCLs and NR 140 PAL and the distance of contamination is approximately 80 to 150 feet from the project corridor intersection, this site should not to impact the proposed improvements. Therefore, further investigation is recommended for the site.

The need for further investigation could be re-evaluated once construction and/or real estate requirements have been finalized.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

Dear Mr. Kelling:

RE: PECFA Form 4, former Petro Pantry, 7168 North 43rd Street, FID #241123650 ERR-LUST

I have signed your PECFA Form 4. The Wisconsin Department of Natural Resources closed this case on September 30, 1994. Please send the white original copy to the Wisconsin Department of Industry, Labor, and Human Relations. Keep the green copy for your records.

Sincerely,

John Feeney
Hydrogeologist, Tank Response Unit

Section 101.143 (3) (c) 4, Wis. Stats., requires that a claimant obtain written approval from the Department of Natural Resources (DNR) when requesting reimbursement for activities in response to a discharge from a commercial petroleum product storage system or home oil tank. The DNR approval must indicate that the site investigation and remedial action plan is adequate to meet requirements of s. 144.76, Wis. Stats. The DNR approval is created for the purpose of meeting the requirements of s. 101.143 (3), Wis. Stats., only and does not bar the DNR from requiring that additional investigation and/or remediation activities be performed by persons responsible under s. 144.76, Wis. Stats.

Office Use Only Application Case # _____

Tank ID # _____ Installation Date _____
Tank ID # _____ Installation Date _____
Tank ID # _____ Installation Date _____

Claimant's Name: JST Corp	Remedial Action Site Name (if business): Petro Pantry
Street Address: 4585 Hewitts Pt. Rd.	Remedial Action Site Address: 7168 N. 43rd St.
City, State, Zip Code: Oconomowoc, Wi 53066	City, State, Zip Code: Milwaukee, Wi 53209
Claimant's Telephone Number: (414) 768-7100	Telephone Number of Site: ( )

Claimant is
☐ Owner ☐ Operator ☐ Other - please specify:

Approval requested for: ☐ Petroleum Product Storage System ☐ Home Oil Tank System ☐ Aboveground

FOR DNR USE ONLY (Indicate Whether Completed Remedial Action or Other Action(s))

A copy of this completed document must be submitted to DNR for approval of initial activities (emergency action, site investigation and remediation) in accordance with s. 101.143 (3) (c) 4, Wis. Stats.

☐ Completed Remedial Action (complete cleanup and single claim for reimbursement) (Steps 1 through 3)

Progress Payments For:

Check Appropriate Box(es)

☐ Emergency Action (Step 1 - check only if emergency action was performed)

☐ Completion of Site Investigation (Step 1) and Proposed Remedial Action Plan (Step 2)

☐ Remedial Action (Step 3)

☒ Operation/Maintenance and Environmental Monitoring (annual claim for remedial action activities) (Step 4)

☐ Site Investigation **By Order** of DNR And/Or DILHR - No Remedial Action

The DNR received a request for approval of the above identified activities for the site listed on this document on the following date 3/31/95.

The DNR response for purposes of s. 101.143 (3), Wis. Stats., is attached.

Remedial action activities conducted by owners/operators are not eligible for funding under 42 USC 6991 (L.U.S.T. Funding). (See s. 101.143 (3) (a) 2., Wis. Stats.)

Send one copy of this completed form to the address shown in the upper right corner and one copy to the claimant.

RE: Ground-Water Quality Monitoring Wells and Extraction Well Abandonment, Former Petro Pantry, 7168 North 43rd Street, Milwaukee, Wisconsin (WDNR FID #241123650)

Dear Mr. Kelling:

Enclosed with this letter are the Wisconsin Department of Natural Resources (WDNR) well/drillhole/borehole abandonment forms for the abandonment of the subject wells. Three ground-water quality monitoring wells (monitoring wells MW100, MW200, and MW300) and one ground-water extraction well (sump) were decommissioned at the Former Petro Pantry, Milwaukee, Wisconsin on November 9, 1994. The wells were decommissioned by Sauter Drilling, Incorporated (Sauter) of Butler, Wisconsin. Sauter decommissioned the wells in accordance with chapter NR 141 Wisconsin Administrative Code. The polyvinyl chloride (PVC) piping was cut off 30 inches below grade in monitoring wells MW100, MW200, and MW300, and each PVC casing and borehole was backfilled with chipped bentonite hole plug. The extraction well was backfilled with concrete to grade.

Northern Environmental Technologies, Incorporated (Northern Environmental) understands that this work concludes the WDNR-required activities associated with the leaking underground storage tank investigation and remediation at the site, and the WDNR has assigned the case as no further action status.

We trust this information meets your needs. Please feel free to contact us if you have any questions or comments.

Sincerely,
Northern Environmental Technologies, Incorporated

Michael F. Cape
Hydrogeologist

Oconomowoc, WI 53066

Dear Mr. Kelling:

RE: Petroleum contamination at former Petro Pantry, 7168 North 43rd Street, FID #241123650

I have reviewed the results of the off-site investigation and results from sampling the on-site sump based on the following reports prepared by Northern Environmental:

Off-Site Investigation Report, April 13, 1994

Supplemental Investigation Petroleum Fuel Release, August 16, 1994

The Wisconsin Department of Natural Resources agrees with Northern Environmental that no further work is needed at the site.

You must properly abandon the monitoring wells and the sump. Please submit documentation of that action within 60 days. Any residual petroleum contaminated soil that is dug up in the future must be handled and disposed of according to current WDNR solid waste regulations, and the WDNR must be notified.

Please note that this letter does not constitute Department "certification" under s. 144.765(2)(a)3, Stats., as created by 1993 Wisconsin Act 453 (May 12, 1994). Persons who meet the definition of "purchaser" in s. 144.765(1)(c), Stats. must receive Department pre-approval prior to conducting a site investigation in order to be eligible for the liability exemption under s. 144.765, Stats.

Sincerely,

John Feeney
Hydrogeologist, Tank Response Unit

1.0 EXECUTIVE SUMMARY

The former Petro Pantry Property is located at 7168 North 43rd Street in Milwaukee, Wisconsin ("the Property"). Gasoline was stored and dispensed at the site for many years. A gasoline release was discovered during April 1972. Phase-separated gasoline and contaminated ground water was recovered at the Property until November 1976. Gasoline contaminated soil was identified during 1989 when the underground storage tanks (USTs) were removed.

Northern Environmental Technologies, Incorporated (Northern Environmental) was retained during 1990 to direct remedial activities at the Property. Approximately 12,000 tons of gasoline contaminated soil was excavated and landfilled. A ground-water collection system and a passive soil venting system were installed in the former excavation. The excavation was backfilled and levelled to grade. The sump (part of the ground-water collection system) was periodically dewatered to help limit the off-site migration of contaminants. After a project delay, five borings (three of which were completed as ground-water monitoring wells) were installed during February 1994 to investigate potential off-site soil and ground-water contamination. No petroleum fuel contamination was detected in samples collected from the ground-water quality monitoring wells. Low concentrations of methyl-tertiary-butyl-ether (MTBE) and benzene were detected in one soil sample collected from one of the off-site borings.

During April 1994, the Wisconsin Department of Natural Resources (WDNR) requested additional soil and soil vapor investigation to evaluate if gasoline contaminated soil was present around the apartment building located adjacent to the Property. Additionally, the WDNR requested another round of ground-water quality analyses from the sump located at the former Petro Pantry. Northern Environmental collected soil and soil vapor samples from seven Geoprobe boreholes located around the apartment building. The concentrations of regulated substances in soil samples were below WDNR interim cleanup guideline limits. No petroleum volatile organic compounds (PVOCs) were detected in soil vapor. Ground water from the collection sump contains concentrations of benzene slightly above the WDNR Preventive Action Limit. These results confirmed that residual inaccessible contaminated soil is limited to an area along the eastern and western edge of the former Petro Pantry property. Northern Environmental recommends that the WDNR close the case.

Printed on Recycled Paper

2.0 INTRODUCTION AND BACKGROUND INFORMATION

The former Petro Pantry is located at 7168 North 43rd Street which is the southeast corner of the intersection of 43rd Street and Good Hope Avenue (hereafter referred to as "the Property"). Petroleum fuel was stored and dispensed for many years at the Property by several automotive service stations. The Property is located in the Northwest Quarter of the Northwest Quarter of Section 24, Township 8 North, Range 21 East, in the City of Milwaukee, Milwaukee County, Wisconsin (44 degrees, 11 minutes, 07 seconds North Latitude, and 88 degrees, 03 minutes, 47 seconds West Longitude) (Figure 1) (Reference 1). Additional background information regarding remedial activities at the Property was previously submitted to the Wisconsin Department of Natural Resources (WDNR) (References 2 through 7).

During April 1972, released gasoline was discovered and a recovery sump was installed at the Property. Ground water and phase-separated gasoline were pumped from the sump until November 1976. Subsequent investigations were completed by Warzyn Engineering during 1989. During October 1989, all underground storage tanks (USTs) at the Property were removed and additional contaminated soils were identified.

Northern Environmental Technologies, Incorporated (Northern Environmental) was retained by J.S.T. Corporation in 1990 to observe and direct remedial activities at the Property. Approximately 12,000 tons of contaminated soil were excavated and landfilled. The final excavation measured approximately 100 feet wide, 160 feet long, and 16 feet deep. Excavation was concluded after all accessible contaminated soil was removed or until clean soil was encountered. Contaminated soil remained along the east and west excavation sidewalls. These soils could not be removed without damaging nearby roadways and adjacent buildings. A ground-water collection system and a passive soil venting system were installed in the bottom of the final remedial excavation. The balance of the excavation was backfilled and compacted with clean, clay fill. Approximately two feet of high clay-content soil covered with six inches of traffic bond road base capped the former excavation to limit surface water infiltration.

As reported in Northern Environmental's November 1991 report (Reference 4), residual contaminated soil most likely extends less than 20 feet east and west of the former excavation between 2.0 and 10.0 feet below grade. To help flush residual contamination remaining in soil surrounding the former excavation, the former excavation was periodically de-watered using the ground-water collection system. The ground water was discharged to the sanitary sewer system under permit by the Milwaukee Metropolitan Sewerage District (MMSD).

Remedial activities at the Property were delayed during 1992 by the difficulty of obtaining permits. Permits were needed to discharge water to sanitary sewers and to drill soil borings in the median on North 43rd Street. The permit to discharge waste water was granted by the MMSD during January 1993. The permit to drill soil borings in Milwaukee County right-of-way (median) was granted by the Milwaukee Department of Public Works during February 1993. The project was further delayed during March 1993 since the City would not allow monitoring wells to be installed on the City's property, only soil borings. A Public Way Permit also needed to install monitoring wells in the right-of-way. The Public Way Permit was obtained during November 1993. Off-site monitoring wells were finally installed during February 1994.

FIGURE 1

On April 14, 1994, Alan Kelling (J.S.T. Corporation) and Jonathan Lewis (Northern Environmental) met with John Feeney (WDNR) to discuss the recently completed off-site soil and ground-water investigation, and WDNR requirements for case closure (Reference 8). As reported in Northern Environmental's April 1994 report (Reference 2), slightly elevated concentrations of MTBE and benzene (10 milligrams per kilogram [mg/kg] and 7 mg/kg, respectively) were detected in boring number B500 located immediately south of the apartment building (Figure 2). The WDNR stated that in order to evaluate the case for closure, the extent of petroleum volatile organic compounds (PVOCs) in soil near the apartment building must be better determined, and another round of ground-water quality samples would need to be collected from the extraction sump. In addition, the WDNR requested that the concentration of gasoline be measured in soil and soil vapor near the apartment building.

Northern Environmental sampled soils and installed soil vapor monitoring points as part of the approved investigative and remedial workplan (Reference 8). The investigation was designed to identify the presence of residual petroleum contaminated soil and potential petroleum fuel vapors in near-surface sediments around the apartment building located adjacent to the Property. The former remedial excavation was also periodically de-watered. Samples from the collection sump were then collected and laboratory analyzed. This report describes the methods used to conduct the investigation, and summarizes and interprets the resultant data.

FIGURE 2

3.0 REMEDIAL INVESTIGATION METHODS

Methods used to complete investigative work are briefly described below. Remedial investigation methods are described in more detail in Appendix A.

3.1 Soil Sampling, Screening, and Analysis

In conformance with the approved workplan (Reference 2), seven Geoprobe boreholes (B800 through B1400) were drilled during June 1, 1994 at the locations shown in Figure 2. The boreholes were drilled to approximately 9 feet below grade. Borehole logs are provided in Appendix B.

Soil samples were collected at regular intervals from each borehole, field screened, and described. Field screening results are summarized in Table 1. Select soil samples were submitted for laboratory analysis. Soil samples were analyzed for gasoline range organics (GRO) using the WDNR Modified Method and PVOCs using EPA Method 8020. Soil sample laboratory results are summarized in Table 2. Complete laboratory reports and chain-of-custody forms are included in Appendix C1. Soil generated by the Geoprobe sampler, which was not used for laboratory analysis, and soil used for field screening was placed on the Former Petro Pantry Property.

3.2 Soil Vapor Monitoring Point Installation, Sampling, and Analysis

Each borehole was completed as a soil vapor monitoring point. The soil vapor points were positioned in the borings between 4.0 and 5.5 feet below grade. The position of the vapor points was determined by site geology and anticipated depth to ground water. Figure 3 depicts typical vapor monitoring point construction details.

Each vapor point was sampled on June 2, 1994 using a Sensidyne air sampling pump and carbon collection tubes. Prior to carbon tube sampling, each soil vapor point was purged and field screened using a PID to measure for the presence of PVOCs, and help determine the quantity of air which should be pumped through the carbon tubes. The carbon tubes were laboratory analyzed for PVOCs using EPA Method 8020. PVOCs were not detected in any of the carbon tube samples (Table 3). Laboratory reports and chain-of-custody forms are presented in Appendix C2.

3.3 Sump Dewatering, Sampling and Analysis

The sump at the Property has been periodically de-watered and sampled since May 1991. Approximately 32,000 gallons were purged from the sump for the latest sampling event. The purge water was discharged under permit (MMSD Permit #94.029) directly to the local sanitary sewer. Approximate volumes purged prior to sampling are presented in Table 4. After the third dewatering for the latest sampling event (July 7, 1994), the sump was sampled and analyzed for volatile organic compounds (VOCs) using EPA Method 8021. Laboratory results for all sampling dates are summarized in Table 4. Complete laboratory reports and the associated chain-of-custody form for the July 7, 1994 sampling event are provided in Appendix C3.

4.0 SUMMARY OF FIELD SCREENING AND LABORATORY RESULTS

4.1 Soil Samples

No petroleum odors, stained soils, or elevated PID responses were detected in soil samples collected from the boreholes on June 1, 1994. Background PID values ranged from 1.8 to 2.5 instrument units as isobutylene (iui) during soil sample field screening. Soil samples produced PID responses ranging from 2.0 to 3.5 iui. Table 1 summarizes soil sample field screening results for borings drilled around the apartment building. Sediments encountered in the borings consisted of firm, moist, sandy silt and silty clay, and are likely glaciofluvial sediments and glacial till of the Oak Creek Formation (Reference 9). No significant concentrations of GRO or PVOCs were detected in any of the recent soil samples. This information was used to redefine the extent of near-surface residual soil contamination along the eastern side of the former remedial excavation (Figure 4).

4.2 Soil Vapor Samples

No elevated PID responses were detected in soil vapor prior to carbon tube sampling. Background PID values ranged from 0.0 to 4.6 instrument units as isobutylene. No PVOCs were detected in the carbon tube samples (Table 3).

4.3 Ground-Water Samples

Laboratory analytical results for water samples are summarized in Table 4. Low concentrations of VOCs were detected in the latest ground-water sample. Benzene was detected at a concentration of 2.0 micrograms per liter (μg/l) in the sump, which is slightly above the WDNR Preventive Action Limit concentration for ground-water quality (Reference 10). No other VOCs were detected in concentrations above their respective WDNR Preventive Action Limit concentrations (Reference 10) from the sump. No VOCs were detected in water collected from monitoring wells MW100, MW200, or MW300 (Reference 2).

G.M.B. ENGINEERING 55/021

5.0 REGULATORY REQUIREMENTS

The action level to trigger soil investigations is 10 mg/kg GRO (Reference 11). The WDNR has established interim soil cleanup guidelines for case closure at sites where petroleum discharges have occurred (Reference 11). These cleanup guidelines are consistent with the proposed Chapters NR 720 and 722 of the Wisconsin Administrative Code (WAC) (Reference 12). The interim cleanup levels are based upon the nature of contaminants, the degree and extent of contamination, local hydrogeologic conditions, and the potential for human exposure to the contamination. Table 2 presents the interim soil cleanup guidelines for petroleum contaminants detected in off-site boreholes. The concentration of benzene detected in sample number S507 (boring B500) is slightly above the interim cleanup guideline. No other PVOCs were detected above their respective cleanup guidelines in any of the other boreholes.

Public health related ground-water quality standards are set forth by the WAC (Reference 10). Standards are listed for substances of public health concern (defined as substances having carcinogenic, mutagenic, teratogenic properties, or interactive effects) and substances of public welfare concern (roughly defined as having a negative aesthetic value, but with little threat to human health). Two levels of standards are listed: Enforcement Standard (ES) and Preventive Action Limit (PAL). The ES represents a concentration above which action generally must be taken to improve the quality of ground water. The PAL represents a lower concentration (usually 10 to 20 percent of the ES) above which the ground-water quality should be monitored for change. Ground-water quality results are compared to the WDNR ground-water quality standards in Table 4. The concentrations of PVOCs detected in the recovery sump during the last four rounds of sampling are below PAL concentrations with the exception of benzene. However, benzene concentrations are still below the ES. The WDNR could request that ground-water quality at the Property be monitored for change.

The Wisconsin Spill Law (Reference 13) requires that "The discharger shall immediately initiate actions necessary to halt the discharge and to restore the environment to the extent practicable and shall minimize the harmful effects from any discharge to the air, land, or waters of the state. These actions may include, but are not limited to, containment, cleanup, storage, transportation, disposal, restoration, or replacement of plants and wildlife and testing of the affected area. The discharger shall keep the department informed and shall secure necessary written approvals from the department for specific actions when such approvals are required by law." Therefore, the Wisconsin Spill Law requires that the owner or operator initiate a cleanup action and keep the WDNR informed of cleanup actions taken to remediate site impacts.

Pursuant to the Wisconsin Spill Law, the following actions have been completed.

- The release was reported to the WDNR.
- The bulk of the relatively "most contaminated" and all other accessible contaminated soil (approximately 12,000 tons) were excavated and landfilled.
- A ground-water collection system and a passive soil venting system were operated at the Property.

Printed on Recycled Paper

- Soil and ground-water samples collected from boreholes and monitoring wells were analyzed to help determine the concentration and extent of residual off-site contamination.

- The extent of residual contaminated soil and ground water was defined.

- Soil vapor monitoring around the adjacent apartment building suggested that petroleum fuel vapors are not present in soils near the apartment building.

- The former excavation was periodically dewatered to limit off-site migration of contaminants.

Printed on Recycled Paper

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the soil vapor, soil, and ground-water sample results, the extent of residual soil contamination was further defined (Figure 4). Soil and soil vapor samples suggest that petroleum fuel is not present in the areas where the boreholes were installed. No significant concentrations of GRO or PVOCs were detected in soils collected from the recent boreholes. No PVOCs were detected in any of the soil vapor samples. Consequently, residual soil contamination is likely confined to a small area just beyond the former excavation (Figure 4). Residual soil contamination probably extends less than 20 feet east and west of the former excavation between approximately 2.0 and 10.0 feet below grade (Figure 4). The residual contaminated soils cannot be removed without damaging buildings and roads. Therefore, Northern Environmental recommends that the residual petroleum contaminated soil remain in-place to naturally degrade.

Concentrations of VOCs detected in the sump have decreased over time (Table 4). No petroleum fuel contaminant concentrations exceed ES standards, and only benzene exceeds the PAL concentration. Based upon these findings, Northern Environmental believes that residual contaminant concentrations will continue to decrease with time. Since ground-water contamination was not identified in the off-site monitoring wells, Northern Environmental recommends that the existing monitoring wells be properly decommissioned.

Considering the minimal threat posed by residual gasoline contamination at the Property, Northern Environmental recommends that the WDNR close the site and assign the case "no further action" status.

The results of this study are based upon professional interpretation of the information available to Northern Environmental. Northern Environmental has assumed that the information provided by the cited references is complete and correct. Northern Environmental does not warrant that this report represents an exhaustive study of all possible environmental concerns. However, the items investigated as part of this study do represent likely sources of environmental concerns associated with the former USTs, and are consequently believed to adequately address impacts to soil and ground-water quality at the Property.

A check in a checkbox indicates a positive or “yes” response

Site #7
Former Gasoline / Auto Service Station (Currently Subway)
7213 N. Teutonia Avenue
W. Good Hope Rd: STA 215+20 to 216+20 LT

The site is identified on the EDR historic auto database. Based on field reconnaissance, the site is currently a Subway restaurant with parking lot. Review of the Milwaukee County GIS Map Server online indicated that the site is owned by VR REAL ESTATE, INC. [Ref. 1].

According to the Wisconsin Department of Agriculture, Trade and Consumer Protection (DATCP) Storage Tank Database there are no tanks registered to the site [Ref.2]. However, the site most likely had UST systems in-place between 1958 to 1982 since the EDR Historical Auto database indicates that the property was utilized as a 'gasoline / auto service station'.

According to the EDR report, no Sanborn Map coverage is available for the project corridor.

Himalayan's review of historical aerial photographs indicates that the site was a vacant lot in the 1930s. Between 1950 and 1985, the site has been occupied with a commercial building and parking lot with possible pump islands/canopies for gasoline refueling. All structures at the site were razed in the late-1980s and was redeveloped into a commercial building and parking lot, currently utilized as a restaurant.

Geology / Hydrogeology

Based on the USDA NRCS soil survey report, soils along the site consist of Clayey land (Cv) [Ref. 3]. Clayey land is generally described as areas where development activities have either covered over or removed the original solum of the soil, therefore, native soil conditions are no longer present within the project corridor. This soil type is described as moderately well drained and the depth to groundwater is generally about 12 to 80 inches bgs.

Soil / Groundwater Impacts

Based on Himalayan's record search, it appears that no soil or groundwater analytical data are available for the site. However, the current condition of these UST systems is unknown and a potential release of petroleum products from these former / current USTs systems could have possibly impacted local soil and groundwater conditions at the site.

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site.

Recommendations

Considering the historical land use (gasoline service station for over almost 40 years) and unknown condition of UST systems, this site could possibly impact the proposed improvements. Therefore, further investigation is recommended for the site.

The need for further investigation may need to be re-evaluated once the final design information is available.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

Recommendations accepted by (name and title): on

Signature: _____

A check in a checkbox indicates a positive or "yes" response

Site #8
Former Heiser Leasing (currently Andy's Gas & Carwash)
7220-7222 N. Teutonia Avenue
W. Good Hope Rd: STA 217+40 to 219+10 LT

The site is identified on the UST, LUST (BRRTS# 03-41-182137), SPILLS (BRRTS# 04-41-551765), RCRA-VSQG, CRS, AUL, EDR historical auto database. Based on field reconnaissance, the site is currently occupied by a Mobil gas station. Review of the Milwaukee County GIS & Land Information Interactive Map online indicates the site is owned by Mac Services, Inc [Ref.1].

Four tanks are registered to the site with a street address of 7220 N. Teutonia Avenue and three tanks are registered to 7222 N. Teutonia Avenue [Ref.2]. In December 1975, three 4,000-gallon leaded gasoline USTs were closed / removed. In April 1997, one waste / used motor oil was closed / removed. One 10,000-gallon diesel UST, one 10,000-gallon unleaded gasoline UST, and one 15,000-gallon unleaded gasoline UST were installed in November 2000 and are currently 'in use' at the site. The occupancy for all tanks is listed as 'retail fuel sales'.

According to the EDR report, no Sanborn Map coverage is available for the project corridor. The EDR historical auto database indicates that the site has been utilized as a gasoline service station since 2003.

Himalayan's review of historical aerial photographs indicates the site had a residence and garage between 1937 and early 1960s. By 1967, all structures at the site were razed and redeveloped with a commercial building, parking lot, and pump islands. In the 2000s, the commercial building was replaced and a canopy was constructed at the site. Historical photographs indicate that the site has been utilized as a gasoline service station for over 50 years.

BRRTS #03-41-182137: In February 1998, the site owner received a notification of hazardous substances discharged [Ref. 3]. Based on a report by Sigma Environmental Services, Inc. (Sigma), 11 borings (GP-1 to GP-11) were advanced at the site in 1998 with a maximum depth of 20 ft bgs. Six borings were also converted to groundwater monitoring wells (MW-1 to MW-6). Soils samples were analyzed for DRO, GRO, VOCs, PAHs, PCBs, lead, and cadmium, and groundwater was analyzed for GRO, VOCs, lead, nitrogen, and sulfate. Groundwater depth was 6 to 10 feet bgs with a flow direction of north - northwest [Ref.4].

Based on Sigma's report, 3,119 tons of impacted soil around the former/current UST locations was excavated and transported off-site to a sanitary landfill between March to October 2000. Prior to installing updated UST systems and backfilling with clean material, 19 confirmation soil samples (1 to 14, S-1 to S-5) were collected from the bottom and sidewalls of the excavation at depths ranging from 3 to 12 feet bgs. The soil samples were analyzed for PVOCs [Ref. 5].

According to Sigma, residual soil and groundwater contamination exceeding State clean-up guidelines are within the W. Good Hope Road and N. Teutonia Avenue right of ways and may also extend underneath both roadways. Sigma also concluded that these impacts do not appear to be moving off-site and should not pose a significant risk to humans or the environment. The activity was conditionally closed by the WDNR in February 2004, with cap maintenance over residual soil contamination, groundwater use restriction, and notification to City of Milwaukee DPW about petroleum contamination within the public right of way and roadways [Ref.3].

BRRTS #04-41-551765 In August 2004, the site owner received a notification of hazardous substances discharged [Ref. 3]. The release was initially recorded with the WDNR under the Environmental Repair Program (ERP) #02-41-542975, which was later changed to a 'spill activity'. According to an investigation conducted by Konicek Environmental Consulting, LLC (Konicek), an undetermined amount of gasoline from a fuel pump dispenser conduit had leaked into the basement of Andy's Fuel Station. Based the investigation results, Konicek concluded that the release did not impact soil or groundwater conditions between the pump island and building at the site [Ref. 5]. The ERP / spill activity was closed by the WDNR in February 2010.

Geology / Hydrogeology

According to the Sigma report, soils at the site generally consisted of silty sand mixtures to at least 10 feet bgs with silty clays underneath [Ref. 4]. Several discontinuous sand seams were also encountered in various borings. Sigma noted that these layers and several utility corridors extending through the site are possible contaminant migration pathways.

Groundwater was encountered at approximately 6 to 10 feet bgs and the flow direction was estimated to be north / northwest, trending away from the intersection of N. Teutonia Avenue and W. Good Hope Road.

Soil Impacts

According to the Sigma's initial investigation and subsequent remedial activities, impacted soils were removed from the site to the extent feasible. However, soil contamination remains within the public right of way at several areas at the site. Soil samples MW-5, GP-4, 3, 4, and 11; from 0 to 7 feet bgs; had benzene (39 to 133 µg/kg), ethylbenzene (4.8 to 70,700 µg/kg), xylenes (140 to 258,000 µg/kg), and/or naphthalene (50 to 11,000 µg/kg) exceeding their respective NR 720 RCLs [Ref.4]

It appears that residual soil contamination is within the current N. Teutonia Avenue and W. Good Hope Road right of ways and possibly underneath both roadways.

Groundwater Impacts

Based on the most recent groundwater sampling event in February 2002, several PVOCs were detected in most of the monitoring wells at the site. Benzene concentrations in MW-1R, MW-2, MW-4, MW-5R, and MW-7 (6.4 to 190 µg/L) exceeded the NR 140 ES. Ethylbenzene (1,500 µg/L), xylenes (12,600 µg/L), trimethylbenzenes (1,650 µg/L), and naphthalene (180 µg/L) concentrations in MW-1R also exceeded their respective NR 140 ES [Ref.4]

It appears that the groundwater contaminant plume may still be present within the current N. Teutonia Avenue and W. Good Hope Road right of way and possibly underneath both roadways.

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site.

Recommendations

Considering that the property has been used as a gasoline filling station and auto service facility for over 50 years and residual soil / groundwater contamination is shallow (0 to 10 feet bgs) and within the current right of ways, this site has the potential to impact some proposed improvements. Therefore, further investigation is recommended for the site.

The need for further investigation should be re-evaluated once construction and/or real estate requirements have been finalized.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

EXECUTIVE SUMMARY

Sigma Environmental Services, Inc. (Sigma) was initially retained by the Heiser Automotive Group (Heiser) and subsequently by Priya Corporation to conduct remedial investigation and closure activities at the former Parkside Shell Service Station site. This change occurred because of the property ownership transfer from Heiser to Anup K. Kullar of Priya Cooperation (Priya). The assessment activities were promulgated as a result of the removal of a waste motor oil UST and tank closure assessment activities conducted by Sigma, which indicated the presence of hydrocarbon impacts in shallow soils adjacent to the tank. Based on the soil impacts detected during the waste oil UST removal activities, Heiser decided to conduct a more thorough site investigation to assess the extent and magnitude of potential soil and groundwater impacts associated with the Parkside Shell Service Station formerly located at the property (circa 1966 - 1976).

A subsurface investigation consisting of 11 Geoprobe soil borings, six hollow stem auger soil borings, and six monitoring wells was completed between March 1998 and October 1998 to assess physical and chemical conditions beneath the site. Following the investigation, Sigma recommended limited soil excavation and natural attenuation groundwater monitoring at the site. A total of 3119 tons of soil was removed from the site between March 2000 and October 2000 as part of both PECFA eligible remediation and not eligible site redevelopment activities. A total of four hollow stem auger soil borings converted to four monitoring wells were installed on January 18, 2001 to replace the monitoring wells damaged during the excavation.

The subsurface soils at the site consist of a combination of silt, clay, and sand. Two lithologies comprise the subsurface material. The most dominant lithology is a gray to grayish brown clay that was encountered in each Geoprobe and hollow stem auger boring from the surface to at least 20 feet bgs; while an interbedded silty sand layer ranged from two to 10 feet in thickness across some areas of the property. Saturated soil conditions beneath the property are generally shallow. Depth to water relative to the top of casing at each well ranged from approximately 5.09 to 13.9 feet bgs with an average depth of 8.2 feet bgs, based on February 2002 data. The average hydraulic gradient is approximately 0.039 feet/foot. Hydraulic conductivity values at the site were determined by performing slug-out tests on monitoring wells MW-2, MW-3, and MW-5. Based on the results of the slug tests, the geometric mean hydraulic conductivity for the site is 8.63×10^{-4} centimeters per second (cm/sec)

Pre-excavation laboratory data indicate that soil samples collected from GP-1, GP-3, GP-7, GP-8, MW-1 and MW-2 contained GRO and PVOC concentrations exceeding applicable soil cleanup guidelines. Benzene was detected in GP-2 and GP-4 at concentrations in excess of the NR 720 Residual Contaminant Levels (RCLs). Based on the distribution of the contaminants in the subsurface soils prior to the excavation, the majority of contaminant mass was concentrated around the former USTs and dispenser areas. After the initial investigative soil and groundwater sampling, soil excavation activities were completed to excavation depths ranging four to 12 feet bgs at the former UST and the former dispenser island locations. A total of 1699 tons of soil was removed from these locations with an additional 1420 tons removed during tank and dispenser island replacement and basement installation activities.

Laboratory data from the last sampling event indicates that groundwater collected from monitoring well MW-8 does not contain PVOC concentrations that exceed the NR 140 Enforcement Standards (ESs). Monitoring well MW-1R contained detectable PVOC and naphthalene concentrations exceeding NR 140 ESs. Benzene concentrations were detected above the NR 140 ES at monitoring well MW-2, MW-5R, and MW-7. A Mann Kendall statistical analysis run at MW-1 and MW-1R, MW-2, and MW-5 and MW-5R, reports a decreasing or stable trend to exist at all monitoring wells analyzed. Geochemical indicators supportive of biodegradation are present in groundwater at the site. Based on the D.O., sulfate, nitrate, manganese and ferrous iron levels detected, it has been determined that anaerobic biodegradation of petroleum hydrocarbons is taking place at the site.

Petroleum impacted soils have been removed from the site to the extent feasible and the former leaking tanks systems have been removed. Although the majority of the soil contaminants are believed to have been removed from the site, COMM 46 exceedances exist. However, direct contact risk and migration to groundwater via leaching is controlled via impermeable asphalt paving that exists across the entire site. Sigma recommends that the site be listed on the Wisconsin Department of Natural Resources (WDNR's) GIS Registry soil database.

Groundwater impacts do not appear to be moving off-site and are remaining stable or decreasing with respect to contaminant concentrations. Based on groundwater biofeasibility analyses results, natural attenuation via intrinsic bioremediation is a feasible alternative to address residual impacts to soil and groundwater. Based on the proximity of soil and groundwater impacts to Teutonia Avenue, it is likely that impacts exist in the right-of-way and therefore, Sigma recommends notifying the city of this potential issue. Sigma also recommends that the site be listed on the WDNR GIS Registry groundwater database.

Sigma recommends the Wisconsin Department of Commerce grant case closure status for the former Heiser Automotive facility.

1. INTRODUCTION

Sigma Environmental Services, Inc. (Sigma) of Oak Creek, Wisconsin, has been retained by Priya Corporation (Priya) to conduct remedial investigation activities at the former Heiser Automotive Group site located at 7220 N. Teutonia, Glendale, Wisconsin. The assessment activities were promulgated as a result of a waste motor oil UST removal conducted by Waukesha Oil Equipment, Inc. in March 1997 and tank closure assessment activities conducted by Sigma at the same time, which indicated the presence of Wisconsin Modified Method diesel range organics (DRO) impacts in soils adjacent to the tank. Since the removal of the 1,000 gallon waste oil tank, Sigma learned that three 4,000 gallon leaded gasoline tanks were removed from the site in January 1976.

Sigma implemented a subsurface investigation from March 1998 to October 1998 consisting of 11 Geoprobe soil borings, six hollow stem auger soil borings, and six groundwater monitoring wells. The collection of two rounds of groundwater samples from the monitoring well network occurred on August 13, 1998 and March 17, 2000. Based on the results of the subsurface remedial investigation conducted at the site between March 1998 and March 2000, Sigma recommended and performed a combination of soil excavation and a natural attenuation groundwater monitoring activities to remediate the identified petroleum hydrocarbon release at the site.

1.1 **General Discussion**. Sigma has prepared this report to document and discuss the previous site activities, details of the remedial soil excavation, present investigation results, and provide an interpretation of the data generated and how it relates to established State of Wisconsin rules and regulations. All investigation and remedial action activities were completed in accordance with Wisconsin laws and regulations at the time work was performed; specifically, Wisconsin Administrative Code, Chapter NR 700 through NR 747 (Chapter 700-747), Wisconsin Administrative Code, Chapter NR 140 (Chapter 140), and Wisconsin Administrative Code, Chapter NR 140 (Chapter NR 140), Wisconsin Administrative Code Chapter NR 141 (Chapter NR 141), and Wisconsin Administrative Code Chapter COMM 46 (Chapter COMM 46).

2. PURPOSE AND SCOPE OF WORK

2.1 **Purpose of Work**. The purpose of Sigma's investigation was four-fold; 1) define the nature and extent of petroleum hydrocarbon impacts to soil and groundwater beneath the site associated with the former waste oil UST and gasoline UST system; 2) satisfy the requirements of Chapter NR 716.05 for subsurface investigations; 3) generate sufficient geologic and hydrogeologic data to evaluate remedial options to address the impacted soil and

groundwater identified beneath the site; 4) design and implement a remedial action plan consisting of limited soil excavation and natural attenuation groundwater monitoring with the intent of receiving case closure.

2.2 **Scope of Work**. Sigma's scope of work for this project included an evaluation of the presence, type, and extent of soil and groundwater impacts in addition to a determination of the subsurface characteristics (soil types and hydrogeologic conditions) and the remedial activities that followed. The following activities were completed relevant to the subsurface investigation and remedial excavation at the site:

- The removal and closure of a 1,000 gallon waste motor oil UST performed on April 23, 1997.

- The advancement and abandonment of eleven Geoprobe soil borings, consisting of one pre-assessment soil boring and ten investigative soil boring to depths ranging from eight to sixteen feet below ground surface (bgs). Soils samples were collected from each boring for field screening and analysis of one or more of the following: GRO, DRO, Total Lead, Total Cadmium, EPA Method 8021 Volatile Organic Compounds (VOC), EPA Method 8310 Polyaromatic Hydrocarbons (PAH), and EPA Method 8082 Polychlorinated Biphenyls (PCB).

- The advancement of six hollow stem auger (HSA) soil borings to depths ranging from 14.5 to 18.0 feet bgs on August 4 and 5, 1998 to evaluate extents of soil and groundwater impacts. Soil samples were collected at each boring for field screening and the analysis of EPA Method 8020 Petroleum Volatile Organic Compounds (PVOC) and GRO. All of the HSA soil borings (MW-1 through MW-5) were completed as groundwater monitoring wells to evaluate groundwater quality and determine hydrogeologic conditions beneath the site.

- The advancement of four additional HSA borings to depths ranging from 11.5 feet to 19.5 feet bgs on January 16, 2001 due to the destruction of five monitoring wells (MW-1, MW-3, MW-4, MW-5, and MW-6) during excavation procedures. All borings (MW-1R, MW-5R, MW-7, and MW-8) were completed as groundwater monitoring wells to continue monitoring groundwater quality.

- The completion of a professional site survey to determine monitoring well elevations. Monitoring well elevation in conjuction with depth to groundwater measurements were used to determine the groundwater flow direction.

- The completion of "slug out" tests at three monitoring well locations to determine horizontal hydraulic conductivity. Values of hydraulic conductivity were subsequently used to calculate linear groundwater velocity at the site.

- The collection of two rounds of groundwater samples from the monitoring well network (MW-1 through MW-5) on August 13, 1998 and March 17, 2000, with the exception of monitoring well MW-3 on just August 13, 1998. An additional collection of three rounds of groundwater samples from the monitoring well network (MW-1R, MW-2, MW-5R, MW-7, and MW-8) were completed on February 7, 2001, August 7, 2001, and February 25, 2002. Groundwater samples were analyzed for one of more of the following GRO, VOC, PVOC, and Lead. Additional groundwater samples were submitted for analysis of select nutrient parameters. *In situ* field parameters such as redox, temperature, ferrous iron, dissolved oxygen, and pH were also collected on select sampling events from the groundwater monitoring well network.

- The excavation, removal, and disposal of a total of 3119 tons of impacted soil for off-site bioremediation treatment. A total of 1699 tons of soil were removed solely based on remedial activities while the additional 1420 tons of soil were removed due to redevelopment activities.

Additional details regarding the completion of each field activity and interpretations of the data collected during the investigations are included in Sections 4 and 5 of this report.

2.3 Project Team. The following firms and contractors provided services during remedial investigation and remedial action activities completed at this site.

3 SITE AND SURROUNDING AREA DESCRIPTION

3.1 Site Location and Description. The subject property is located at 7220 North Teutonia Avenue, Glendale, Wisconsin (Southeast ¼ of Southwest ¼ of Section 13 Township 8 North, Range 21 East of the Thiensville quadrangle, Milwaukee County, Wisconsin). The location of the property is presented as Figure 1.

The site is located in a predominantly commercial and industrial area. It is bounded to the north by Kentucky Fried Chicken, to the east by ELCO Truck Rentals (ELCO), Good Hope Road to the south (and McDonald's south of Good Hope Road), Teutonia Avenue to the west (and a bank and abandoned lot west of Teutonia Avenue). The ELCO property, located immediately to the east of the subject site previously had an on-going remedial investigation being conducted by Moraine Environmental. The site is listed as high priority with both soil and groundwater contamination reported to exist (FID # 241627650/BRRTS # 03-41-003362).

Detailed historical information about the subject property, and its use is not available. Based on limited information, the site was operated as the Parkside Shell gasoline station from 1966 to 1976, the Heiser car leasing facility from 1976 to 1999, and is currently operating as Andy's Petro Pantry gasoline station.

The 1000-gallon capacity waste motor oil UST (Tank ID # 402004549) was located northwest of the previous building structure and was removed in March 1997. Three additional USTs existed at the time the Parkside Shell was in operation. The three USTs were reported to all be 4,000-gallon capacity bare steel USTs containing leaded gasoline. The USTs were located near the western property boundary; the associated piping trended southeast to dispensers located near the southern property boundary. The USTs are believed to have been abandoned in 1976. No known closure assessments were conducted at the time of abandonment and removal.

In 1999 construction to the property began. Since then the previous building has been demolished. A new building with a basement structure was constructed at the northeast corner of the property, a carwash on the Northern edge of the site was erected, and three gasoline UST were installed near the old UST system. Figure 2 illustrates the locations of the four former tanks and building and the three new gasoline UST and property layout relative to the monitoring well network.

3.1.1. Utility Review. Based on information obtained by Digger's Hotline markings, a professional survey, and a site inspection by Sigma personnel, subsurface utilities such as gas and water are present at the site. The utilities are located on the western edge and north-west corner of the property. Subsurface soil impacts near the northwest corner of the property do not appear to be impacted. While the western edge of the site is side-gradient from the source area and is not believed to be impacted based on the fact that the average depth to groundwater at the site is greater than the depth of the utilities. Also, site permeabilities are relatively high, therefore utilities are at

minimal risk of preferentially receiving impacted groundwater from the former UST system release. Utility locations are illustrated on the site plan map in Figure 2.

3.1.2 Potential Receptors. A review of well construction reports, obtained from the Wisconsin Geological and Natural History Survey (WGNHS), indicate that no private wells constructed in or after 1938 are located within 100 feet of the site and no city wells are located within 1,000 feet of the site. Well construction reports for the any private or city wells in the area are included as Appendix I.

4. INVESTIGATIVE AND EXCAVATION PROCEDURES

Sigma completed a subsurface investigation and remedial action at the site that consisted of the advancement of 11 Geoprobe soil boring, 10 hollow stem auger soil borings, the conversion of 10 hollow stem auger soil borings to groundwater monitoring wells, and the excavation of 3119 tons of contaminated soil. The monitoring wells were developed and sampled upon completion of the monitoring well installation activities. The following is a detailed discussion of investigation and remediation activities, and methodologies. Sigma's Standard Field Methodologies used during the subsurface investigation are presented as Appendix E.

4.1 **Geoprobe investigation**. Sigma conducted a Geoprobe investigation to determine the vertical and lateral extent of subsurface soil impacts. On June 29, 1998, ten Geoprobe soil borings (GP-2 through GP-11) were advanced to depths ranging from 12 to 16 feet below ground surface (bgs). Each of the Geoprobe borings were subsequently abandoned as required by Wisconsin Administrative Code Chapter NR 141. Locations of the Geoprobe borings are depicted on Figure 2. Soil samples were collected from each boring for field screening and analysis of one or more of the following: GRO, DRO, Total Lead, Total Cadmium, EPA Method 8021 Volatile Organic Compounds (VOC), EPA Method 8310 Polyaromatic Hydrocarbons (PAH), and EPA Method 8082 Polychlorinated Biphenyls (PCBs). Geoprobe soil boring logs and abandonment forms are presented in Appendices A and B, respectively.

4.2 **Soil Boring/Monitoring Well Installation and Monitoring Well Development**. On August 4 and 5, 1998, six soil borings were advanced to depths ranging from 14.5 to 18 feet bgs with all six being completed as monitoring wells. An additional four monitoring wells were advanced to depths ranging from 15 to 19.5 feet on January 16, 2000 to account for five wells destroyed during construction and excavation activities. Monitoring wells MW-1, MW-2 and MW-3 were screened from five to 20 feet bgs; monitoring wells MW-4 and MW-5 were screened from 3.5 to 18.5 feet bgs; monitoring well MW-6

was screened from five to 17 feet bgs; and monitoring well MW-7 and MW-1R were screened from five to 15 feet bgs; monitoring wells, MW-8 and MW-5R were screened from four to 19 feet bgs. All ten monitoring wells were completed with flush mount manholes. The soil boring/monitoring well locations were chosen to adequately characterize soil and groundwater impacts in the subsurface and aid in delineating horizontal hydraulic gradients and flow regimes.

During boring advancement, soil samples were collected from soil boreholes MW-1 through MW-6 on a continuous basis and described on the basis of color, texture, grain size, and plasticity, and classified in accordance with the Unified Soil Classification System (USCS). Monitoring wells MW-1R, MW-5R, MW-7, and MW-8 were blind drilled, therefore soil classifications were not made at these borings. The soil classifications, sampling intervals, and descriptions are presented on the Soil Boring Logs in Appendix A.

Soil samples at soil boring MW-1 through MW-6 were collected from each sampling interval and containerized for headspace analysis using a Microtip^{tm} FID that was periodically calibrated for direct response to 1000 parts per million (ppm) methane in air. Field screening results are presented on Soil Boring Logs in Appendix A.

Soil samples from soil borings MW-1 and MW-5 were also collected, containerized, and preserved (where necessary) for potential laboratory analysis of Petroleum Volatile Organic Compounds (PVOC) and GRO. Select soil samples, accompanied by a chain-of-custody document, were submitted to a certified laboratory for analysis based on field screening results and observations. Soil boring logs and monitoring well construction forms are presented as Appendices A and C, respectively. Locations of soil borings and monitoring wells are presented on Figure 2.

Upon completion of monitoring well installation activities, Sigma personnel developed monitoring wells MW-1 through MW-8, MW-1R, and MW-5R in accordance with Chapter NR 141 by alternately surging and bailing the wells with clean Teflon^{TM} bailers and evacuating water and sediment from the wells with a decontaminated peristaltic pump. The development forms are presented in Appendix D.

4.3 **Excavation Procedures**. A total of 3119 tons of contaminated soil was excavated from the site between March 27, 2000 and October 23, 2000. The excavation occurred at five different areas: Area A (former UST location), Area B (former dispenser islands), Area C (present UST location), Area D (present dispenser islands), and Area E (present basement structure). Areas A and B were removed pursuant to the COMM approved remedial

action plan while the other areas were removed as a result of construction and redevelopment activities. Soil samples were collected from the base and the side walls of Area A, B, and D of the excavation to verify removal of the petroleum hydrocarbon impacted soil. Two soil samples were collected from each sampling location. One sample from each location was collected for field screening by means of headspace analysis with a PID calibrated to 100 parts per million isobutylene in air. The second sample was immediately preserved for laboratory analysis of PVOC and Naphthalene. Field observations (visual and olfactory) were used to verify the removal of petroleum hydrocarbon impacted soil at Area C and E of the excavation. A transport sample was collected and field screened at each excavation area for disposal purposes. Exact location and areas of the excavation are presented in Figure 8.

4.4 **Groundwater Sampling Program**. The groundwater monitoring program was implemented in August 1998 for the monitoring well network MW-1 through MW-6. A total of two rounds of groundwater sampling (August 1998 and October 1998) were completed prior to the advancement of additional monitoring wells. Monitoring well MW-1, MW-3, MW-4, MW-5 and MW-6 were destroyed during the construction and excavation activities. Once the excavation and construction activities were completed, four additional and replacement monitoring wells MW-1R, MW-5R, MW-7 and MW-8 were installed.

Groundwater monitoring was implemented in February 2001 for the existing well network: MW-2, MW-7, MW-8, MW-1R, and MW-5R. A total of three rounds of groundwater sampling were completed in February 2001, August 2001, and February 2002. Groundwater samples collected from the wells were submitted under chain-of-custody document to a certified laboratory for chemical analysis of at least one of the following parameters: GRO, VOCs, PVOCs, and Soluble Lead. Duplicate groundwater samples were also collected from the monitoring well network and analyzed for *in situ* measurements (redox, temperature, ferrous iron, dissolved oxygen, and pH) and boifeasiblity parameters (Soluble Sulfate, Soluble Manganese and Nitrate Nitrogen).

4.5 **Static Water-Level Measurements**. Prior to each groundwater sampling event, static water levels were obtained from the monitoring well network to determine the lateral groundwater flow direction and horizontal hydraulic gradient. All water levels were measured using an electronic water-level indicator and were referenced to mean sea level (MSL). The surveyed monitoring well elevations and groundwater levels are presented in Table 2.

4.6 Hydraulic Conductivity Testing. Hydraulic conductivity testing was conducted in June 2001 at monitoring wells MW-2, MW-3, and MW-5 to estimate flow parameters at the site. The procedure consisted of removing an instantaneous volume of water from the well and measuring the rate of water level recovery. The water level was measured and recorded via a down-hole pressure transducer connected to a data logger. The water level versus time data was analyzed using the Bouwer and Rice method to estimate hydraulic conductivity of subsurface material in the vicinity of the well using methods developed for unconfined aquifers.

4.7 Surveying. The elevations and locations of the monitoring wells, utilities, and significant site features including buildings and property lines were determined by a professional survey with a horizontal control accuracy of +/- 1.0 feet, and a vertical accuracy of +/- 0.01 foot. Elevation data was referenced to a local USGS datum in feet above MSL. Monitoring well/ soil boring location data was referenced to the Wisconsin State Plane Coordinate System.

4.8 Soil and Groundwater Waste Handling. All decontamination water, monitoring well development water, and purge water generated during the investigation procedures was containerized in 55-gallon Department of Transportation (DOT) approved drums. All water was either transported to National Tank for disposal or disposed of in the sanitary sewer on-site pursant to MMSD letter dated March 22, 2000, Notice of Intent.

The auger soil cuttings generated during drilling procedures were containerized in 55-gallon DOT-approved drums. All auger spoils were staged on-site and disposed of at Waste Management's Orchard Ridge facility in Menomonee Falls under Profile #BIO467777.

Excavated soil was transported by Northern Petro Services to Waste Management's Orchard Ridge facility under Profile #BOI467777. Each truckload of soil transported from the site was accompanied with a special waste manifest which listed the site name and profile number. Copies of the waste manifest tickets are presented as Appendix F.

5. INVESTIGATION RESULTS

Geology beneath the site was characterized during the drilling and excavation activities. The hydrogeology, including horizontal directions of shallow groundwater flow and horizontal hydraulic gradient, was determined from water-level measurements completed during the field and data collection activities. Soil and groundwater quality beneath the site were evaluated based on the results of field screening measurements and analytical results

of soil and groundwater samples. The following is a discussion of the site-specific physical and chemical characteristics of the soil and groundwater.

5.1 Site-Specific Subsurface Characteristics.

5.1.1 Site Geology. The subsurface soils at the site consist of a combination of silt, clay, and sand. Two intermingling lithologies comprise the subsurface material. The most dominant lithology is a gray to grayish brown silty clay that was encountered in each Geoprobe and hollow stem auger boring. An interbedded silty sand layer that ranged from two to 10 feet in thickness was encountered across some parts of the property.

The specific soil characteristics and depths encountered are shown on the soil boring log forms (Appendix A). Subsurface geology is presented in two geologic cross-sections trending north-south and east-west across the site. The geologic cross section location map is presented as Figure 3; the north-south trending cross section and the east-west trending cross section are presented on Figures 4 and 5, respectively.

5.1.2 Site Hydrogeology. Saturated soil conditions encountered beneath the property are generally shallow. Depth to water relative to the top of casing at each well ranged from approximately 5.09 to 13.9 feet bgs with an average depth of 8.2 feet bgs, based on February 2002 data. Static water-level measurements and groundwater elevation data are summarized in Table 2.

Groundwater contour maps prepared from water-level data collected during the February 2002 sampling event are illustrated on Figure 6. Groundwater flow is predominantly to the northwest. The average hydraulic gradient for the site is approximately 0.0395 feet/foot with a range of 0.003 feet/foot to 0.09 feet/foot.

Hydraulic conductivity values at the site were determined by performing slug-out tests on monitoring wells MW-2, MW-3, and MW-5. Based on the results of the slug tests, the geometric mean hydraulic conductivity for the site is 8.63×10^{-4} centimeters per second (cm/sec) with well-specific hydraulic conductivity values of 3.22×10^{-4} cm/sec at MW-2, 1.28×10^{-3} cm/sec at MW-3, and 1.56×10^{-3} cm/sec at MW-5. The hydraulic conductivity values for the site may be elevated due to the presence of a silty sand layer at monitoring MW-2, MW-3, and MW-5. Hydraulic conductivity results are presented in Appendix H.

The average linear groundwater flow velocity for the formation is determined by the formula:

$$V = KI/n_e$$

Where:

V = groundwater flow velocity (ft/day)
n_e = effective porosity (%)
K = hydraulic conductivity (ft/day)
I = average hydraulic gradient (ft/ft) (Freeze and Cherry, 1989)

Calculated average groundwater linear velocity for the site (using the measured average hydraulic conductivity value, calculated horizontal gradient, and an assumed porosity of 0.25) for the site is 0.3871 feet per day (ft/day) or 141.29 feet per year (ft/yr). The elevated linear groundwater flow velocity for a clay dominated site is due to the presence of an interbedded silty sand layer at some areas across the site and may not be representative of the entire site.

5.2 Soil Quality Results.

5.2.1 Geoprobe Investigation. Soil samples were collected at each interval for field screening using a Photoionization detector (PID). Generally, the soil sample exhibiting the highest field screening result (based on PID readings) or the soil sample from the observed vadose zone water-table interface was submitted to the laboratory for analysis.

Review of the laboratory data indicate that soil samples collected from GP-1, GP-3, GP-7, and GP-8 contains GRO and Benzene, Toluene, Ethylbenzene and Xylenes (BTEX) concentrations exceeding applicable soil cleanup guidelines. In addition, Benzene was detected in borings GP-2 and GP-4 and GRO was detected at boring GP-6 at concentrations in excess of NR 720 RCL. Naphthalene was also detected above its respective PAH interim guidance cleanup level at Geoprobe locations GP-2, GP-3, GP-7, and GP-8. No other Geoprobe sampling locations contained significantly elevated levels of the BTEX or naphthalene compounds. PCB and Cadmium were not detected at the site, from the sample collected at Geoprobe boring GP-10, located adjacent to the former waste motor oil. In addition, lead concentrations were detected below the Wisconsin Administrative Code, Chapter 720 Table 2 industrial standard protective of human health from direct contact, at concentrations ranging from 8.9 mg/kg to 67.0 mg/kg. Since the time that geoprobe soil investigation activities were conducted, the remedial excavation has removed

contaminated soil at groundsurface to depths ranging from four to 12 feet bgs at all soil borings locations with the exception of soil boring GP-2 and GP-4. A summary of the Geoprobe soil results are presented in Table 1 and Figure 9. Soil boring logs and abandonment forms are presented in Appendix A and B, respectively. Soil laboratory reports and chain-of-custody documentation are provided in Appendix J.

5.2.2 Soil Boring/Monitoring Well Investigation. Soil samples were collected and analyzed using the same methodology as the Geoprobe phase of the investigation. Soil samples from soil borings MW-1 through MW-6 were analyzed for PVOC and GRO. Soil borings MW-7, MW-8, MW-1R, and MW-5R were blind drilled therefore soil samples were not collected or analyzed. Laboratory data indicate that soil samples collected from monitoring wells MW-1 and MW-5 had reported GRO and BTEX concentrations exceeding applicable NR 720 Soil Cleanup Standards and NR 720 Residual Contaminant Levels. Contaminated soil at monitoring well MW-1, MW-3, and MW-5 was removed during the excavation of Area A, C, E, and B respectively.

A summary of the pre-excavation soil boring results are presented in Table 1 and are depicted on Figure 9. Soil boring logs, abandonment forms, and monitoring well construction forms are presented in Appendix A, B, and C, respectively. Soil laboratory reports and chain-of-custody documentation are provided in Appendix G.

5.2.3 Excavated Soil Investigation. A remedial soil excavation occurred at the site between March 2000 and October 2000. A total of 3119 tons of contaminated soil were removed and disposed of at Waste Management's Orchard Ridge facility for off-site bioremediation treatment. A total of five different areas consisting of: Area A (32'x26'x6'), Area B (36'x40'x5), Area C (32'x42'x12'), Area D (65'x40'x5'), and Area E (30.8'x54'x12') were excavated. Soil samples were collected from the base and side walls of three excavation areas (Area A, B, and D) for field screening and laboratory analysis. Soil samples were analyzed for PVOC and Naphthalene. Soil samples were not collected during subsequent excavation activities at Area C and E because these areas were excavated during construction activities and Sigma was not contacted prior to backfilling.

Benzene concentrations above Comm 46 table 2 values (Direct Contact with Contaminated Soil) were not detected in soil samples taken from Area A and B, with the exception of the east wall and base of Area B. Additional PVOCs concentrations were detected above Comm 46 table 1 values (Indicators of Residual Petroleum Product in

Soil Pores) at all sampling locations excluding soil samples taken from the west and south wall Area B and the south wall Area A. Soil samples collected from the present dispenser islands (Area D) excavation were reported to have concentrations less than the Comm 46 table 1 and 2 values at all sampling locations.

Subsequent to the remedial excavation of Areas A and B, additional impacted soil areas were excavated due to redevelopment purposes (footings, material not geotechnically sound, etc...) which have extended the boundaries of the original excavation of Areas A and B. Therefore, the majority of impacted soil originally identified has been removed with the exception of soil located at sample location 1 (east wall of Area B) and 11 (west wall of area A).

5.3 Groundwater Quality Results.

5.3.1 Groundwater Analytical Results. To date five rounds of groundwater sampling have been completed: August 1998, March 2000, February 2001, August 2001, and February 2002. Groundwater samples were collected at MW-2 for all sampling events. Monitoring well MW-3 was only sampled in August 1998 while monitoring wells MW-1, MW-4, MW-5, and MW-6 were sampled in August 1998 and March 2000 due to the destruction of the monitoring wells during construction activities. Groundwater samples were collected at monitoring wells MW-1R, MW-5, MW-7 and MW-8 in February 2001, August 2001, and February 2002.

Groundwater samples were collected from the monitoring well network for laboratory analysis of at least one of the following: VOC (first round), PVOC (additional rounds), Naphthalene, GRO, and Lead. During the latest groundwater sampling event PVOC concentrations were reported below NR 140 Enforcement Standards (ES) in monitoring well MW-8. Benzene concentrations were reported above NR 140 ESs for monitoring wells MW-2, MW-5R, and MW-7 while select VOCs (Benzene, Ethylbenzene, Xylenes, Total Trimethylbenzene, and Naphthalene) concentrations at monitoring well MW-1R exceeded NR 140 ESs for the February 2002 sampling event.

Mann-Kendall Statistical Analysis was run at monitoring wells MW-1 and MW1R, MW-2 and MW-5 and MW-5R. Laboratory data was combined for MW-1 and MW-1R and MW-5 and MW-5R in order to have adequate data to properly run a Mann-Kendall Analysis. Mann Kendall Analysis reported a decreasing or stable trend at monitoring well MW-1 and MW-1R, MW-2, and MW-5 and MW-5R for all PVOC

concentrations reported above NR 140 ESs in the last sampling event. Mann Kendall statistical Analysis for monitoring wells, MW-1and MW-1R, MW-2, and MW-5 and MW-5R are presented in Appendix G.

5.3.2 Groundwater Biofeasibility Analysis. Groundwater samples were collected from the monitoring well network for laboratory biofeasibility analysis during all five sampling events. *In situ* analysis during each monitoring event were also completed on the monitoring well network to further evaluate if intrinsic bioremediation of hydrocarbon impacts to groundwater is feasible and on-going.

A review of the nutrient data obtained for the groundwater indicates subsurface conditions are favorable for intrinsic bioremediation. Oxygen and nitrate concentrations are relatively lower in the impacted monitoring well MW-1/MW-1R when compared to clean up-gradient monitoring well MW-6. Similarly, manganese concentrations are relatively higher in MW-1 compared to MW-6. The trends observed in the nutrient concentrations support natural attenuation processes are occurring at the site.

In situ field measurements of pH are within the range (6 to 8) recommended for effective rates of bioremediation. Ferrous iron was observed in impacted monitoring wells MW-1, MW-1R, MW-2, MW-5 and MW-5R indicating microbes are utilizing iron (III) as an alternate electron acceptor. In general, it appears that the groundwater biofeasibility results are indicative of conditions favorable for effective rates of intrinsic bioremediation. Table 4 presents a summary of the *in situ* geochemical results for groundwater. Associated laboratory reports are provided in Appendix J.

6. EVALUATION OF NR 746.06 RISK SCREENING CRITERIA

In accordance with NR 746.06, the following risk criteria (**and how each apply to the site**) shall be used to determine whether the site may be closed as provided in NR 746.07:

(a) None of the following environmental factors are present at the site:

1. Documented expansion of plume margin. (**Groundwater concentrations onsite have been detected to remain stable or decreasing for all contaminant concentrations detected, therefore plume margins appear to be stable/decreasing**).

2. Verified contaminant concentration in a private or public potable well that attains or exceeds the preventive action limit. (**A review of well construction reports obtained from the Wisconsin Geological and Natural History Survey indicates that no public or private wells were installed within 1,000 feet and 100 feet, respectively, of the site after 1938.**).

3. Contamination within bedrock or within 1 meter of bedrock. (**Bedrock has not been encountered beneath the property**).

4. Petroleum product that is not in dissolved phase is present with a thickness of 0.01 feet or more, and has been verified by more than one sampling event. (**Petroleum product has not been detected in the monitoring well network at the property**).

5. Documented contamination discharges to a surface water or wetland. (**The closest surface water body is an intermittent stream located approximately 1500 feet east of the site. However, contaminant discharge from the site is highly improbable due to nominal concentrations of dissolved PVOCs at eastern monitoring wells MW-4 and MW-3**).

(b) No soil contamination is present at the site that exceeds any of the soil screening levels in NR 746.06 Table 1. (**Soil quality data indicates that NR 746.06 soil screening levels were exceeded in soil samples collected at the site. However, contaminated soil has now been removed to a depth ranging from four to 12 feet bgs at the areas where contamination exceeds NR 746.06 Table 1 vaules, with the exception of possible contamination still present at excavation sample 1 and soil boring GP-2 and GP-4. Groundwater data supports that soil leaching to groundwater is not on-going and precipitation infiltrating is prohibited by building/ asphalt/ and or concrete across the site**).

(c) There is no soil contamination within 4 feet of the ground surface that exceeds any of the direct contact soil contaminant concentrations for the substances listed in NR 746.06 Table 2. (**Based on the soil quality data, petroleum hydrocarbon impacts above NR 746.06 Table 2 values are not present within four feet of the ground surface with the exception of a soil sample 1 at excavated Area B; however, this area is covered by asphalt and in not accessible to direct contact**).

(d) For substances not listed in Table 2 that are present within 4 feet of the ground surface and have been approved by the agency with administrative authority for the site as contaminants of concern as

defined in NR 720.03 (2), any potential human health risk from direct contact has been addressed. (**No constituents of concern listed in Table 2, including other petroleum hydrocarbons, have been detected within four feet of ground surface at concentrations which would pose a direct contact threat with the exception of the above information**).

(e) If there are petroleum-product contaminants in soil or groundwater, the most recent release that caused or contributed to the contamination is more than 10 years old. (**Impacted soil was first observed during UST closure activities performed in March 1997. The waste motor oil UST was removed March 1997 while the gasoline UST system was removed January 1976. Due to the time elapsed from gasoline UST removal activities, residual petroleum impacts detected (gasoline) are greater than 10 years old**).

(f) There is no evidence of migration of petroleum product contamination within a utility corridor or within a permeable material or soil along which vapors, free product or contaminated water may flow. (**Due to the location of the utilities present at the site, the fact that contaminants were not detected at the nearest geoprobe soil boring (GP-11), and that site permeabilities are relatively high, utilities are at minimal risk of receiving impacted groundwater**).

(g) There is no evidence of migration or imminent migration of petroleum product contamination to building foundation drain tile, sumps or other points of entry into a basement or other enclosed structure where petroleum vapors could collect and create odors or an adverse impact on indoor air quality or where the contaminants may pose an explosion hazard. (**A basement structure is located on the northeast corner of the site, however, due to the location and the remediation efforts in place before the structure was built there has been no evidence of migration of petroleum product contamination to the building foundation**).

(h) No enforcement standard is attained or exceeded in any groundwater within 1000 feet of a well operated by a public utility, as defined in §. 196.01 (5), or within 100 feet of any other well used to provide water for human consumption. (**See (a) 2 above**).

All NR 746.06 risk criteria have been evaluated and satisfied for this site. Consequently, minimal risk to human health or the environment is present with respect to the release at the former Heiser Leasing property. Based on groundwater biofeasibility data, natural attenuation via intrinsic bioremediation is a feasible alternative to address residual impacts to soil and groundwater.

7. SUMMARY

The following is a summary of the geologic, hydrogeologic, and analytical data obtained from the former Heiser Leasing property located at 7220 N. Teutonia Avenue, Glendale, Wisconsin.

- In March 1997 Sigma conducted a tank closure assessment along with the advancement of a pre-assessment soil boring to evaluate if a hydrocarbon release from the former waste motor oil UST had occurred.

- The subsurface soils at the site consist of a combination of silt, clay, and sand. Two intermingling lithologies comprise the subsurface material. The most dominant lithology is a gray to grayish brown silty clay that was encountered in each Geoprobe and hollow stem auger boring. A silty sand layer that ranged from two to 10 feet in thickness was encountered across some parts of the property.

- Based on the static water-level elevations, the groundwater flow direction was determined to be mostly northwest. The horizontal hydraulic gradient was calculated to be approximately 0.0395 feet/foot for the February 2002 monitoring event. Based on the results of the slug test, the geometric mean for hydraulic conductivity values at the site is 8.63×10^{-4} cm/sec; calculated average groundwater linear velocity for the site is 0.387 ft/day.

- A total of eleven geoprobe soil borings were advanced to depths ranging from eight to sixteen feet bgs. A review of the soil quality results for six of the eleven soil borings sampled contain benzene concentrations greater then NR720 RCLs. Soil borings collected from soil boring GP-3, GP-7, and GP-8 also contained NR 720 RCL exceedances for GRO, toluene, ethylbenzene, xylenes, and naphthalene. While soil boring GP-1 contained NR 720 RCL exceedances for GRO, ethylbenzene, and xylenes. Naphthalene was reported above NR 720 RCLs at soil boring GP-2 while GRO was detected above NR 720 RCLs at GP-6.

- A total of ten hollow stem auger soil borings were completed to depths ranging from 11.5 to 20.0 feet bgs in August 1998 and January 2001. A review of the soil quality results indicate that soil borings MW-1 and MW-5 contain of GRO and ethlybenzene concentrations that exceed the NR 720 RCLs.

- All hollow stem auger soil borings were completed as monitoring wells MW-1 through MW-8, MW-1R, and MW-5R. In the most recent sampling

event, monitoring well MW-8 reported PVOC concentrations below NR 140 ESs while monitoring wells MW-1R, MW-2, MW-5R, and MW-7 all contained concentrations of Benzene greater then NR 140 ESs. Monitoring well MW-1R also contained concentrations of ethylbenzene, xylenes, and naphthalene above NR140 ESs.

Mann Kendall Analysis for monitoring wells MW-1 and MW-1R, MW-2, MW-5 and MW-5R confirms a decreasing or stable trend of all analytes that were present in the most recent sampling event.

° A review of the nutrient data obtained for the groundwater indicates subsurface conditions are favorable of intrinstic bioremediation. Oxygen is available in the subsurface for degradation to occur. Additionally, the trends observed in the nutrient concentrations (such as nitrate, iron, and manganese) support natural attenuation processes are occurring at the site. In general, it appears that the groundwater biofeasibility results are indicative of conditions favorable for effective rates of intrinsic bioremediation.

° A total of 3119 tons of contaminated soil was excavated between March 2000 and October 2000. Approximately 1699 tons of the most highly contaminated soil was removed from ground surface to depths ranging from four to six feet bgs at the former tank and dispenser island areas while an additional 1420 tons was removed to a depth ranging from four to 12 feet bgs at the present tank, dispenser island, and basement locations. Laboratory results confirm that Comm 46 direct contact values have not been exceeded at any of the excavation sample locations with the exception of sample 1 located at the east wall, which is located beneath asphalt.

8. RECOMMENDATIONS

Residual soil impacts no longer appear to pose a significant risk to plume migration or to human health via exposure. Groundwater impacts do not appear to be moving off-site and are remaining stable or decreasing with respect to contaminant concentrations. Based on groundwater biofeasibility, natural attenuation via intrinsic bioremediation is a feasible alternative to address residual impacts to soil and groundwater. Therefore, Sigma recommends that this site be placed on the WDNR GIS Registry soil and groundwater database and the Wisconsin Department of Commerce grant case closure status for the former release.

9. LIMITATIONS OF INVESTIGATION

This report was prepared under constraints of cost, time, and scope, and reflects a limited assessment and evaluation rather than a full, total, complete or extensive assessment and evaluation.

Our assessment was performed using the degree of care and skill ordinarily exercised, under similar circumstances, by professional consultants practicing in this or similar localities. No other warranty or guarantee, expressed or implied, is made as to the conclusions and professional advice included in this report.

The findings of this report are valid as of the present date of the assessment. However, changes in the conditions of a property can occur with the passage of time, whether due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation, from the broadening of knowledge, or from other reasons. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control.

The interpretations and conclusions contained in this report are based upon the result of independent laboratory tests and analysis intended to detect the presence and/or concentrations of certain chemical constituents in samples taken from the subject property. Sigma Environmental Services, Inc. has no control over such testing and analysis and therefore, disclaims any responsibility for any errors and omissions arising therefrom.

A subsurface exploration was performed and presented in this report. However, subsurface exploration cannot totally reveal what is below the surface. Depending upon the sampling method and frequency, every soil condition may not be observed, and some materials or layers which are present in the subsurface may not be noted.

This report is issued with the understanding that it is the responsibility of the owner(s) to ensure that the information and recommendations contained herein are brought to the attention of the appropriate regulatory agency(ies).

This document contains proprietary and confidential information which is the sole and exclusive property of Sigma Environmental Services, Inc. and Priya Corporation. This document may not be used or duplicated in any manner without the express written consent of Sigma Environmental Services, Inc. and Priya Corporation.

Notes
Elevations surveyed by Surveying Associates on August 24, 1998.
Elevations surveyed to feet above mean sea level (MSL)
Groundwater depths reported in feet below top of casing
* Elevations are estimated based on prior survey completed Aug. 1998

Andy's Gas Station, 7222 North Teutonia Avenue, Milwaukee

Dispenser leak into the electrical conduit in 2004

Dear Mr. Khullar:

The Wisconsin Department of Commerce (Commerce) has reviewed the request for case closure prepared by your consultant, Konicek Environmental Consulting, LLC, for the site referenced above. Commerce has determined that this site does not pose a significant threat to human health or the environment. This case is now listed as "closed" on the Commerce database. No further investigation or remedial action is necessary.

It is in your best interest to keep all documentation related to the environmental activities at your site. If residual contamination is encountered in the future, it must be managed in accordance with all applicable State and federal regulations. If it is determined that any remaining contamination poses a threat, the case may be reopened and further investigation or remediation may be required.

Thank you for your efforts to protect Wisconsin's environment. If you have any questions, please contact me in writing at the letterhead address or by telephone at (414) 357-4703.

Sincerely,

Linda M. Michalets

Dear Ms Michalets:

In response to your December 17, 2009 letter Konicek Environmental Consulting LLC (KEC) provides the following:

KEC met on site with Tim Shyd of Lemberg Electric. Mr. Shyd indicated that the electrical conduit ran north in between the islands then east into the building as drawn on the attached figure. Mr. Shyd also indicated that the conduit was approximately two feet below the surface.

Based on the information obtained from Lemberg Electric, approximately 135 feet of conduit exist between the pump and the building and GP2/TW1 is approximately 25 feet from the conduit.

KEC obtained the Incident Report from the Milwaukee Fire Department and the Daily Time Sheet from North Shore Environmental Construction. Both are attached. No other repair reports were obtainable.

KEC also checked the sump installed in the tank cavity for product, odors and vapors by PID screening on January 26, 2010. Groundwater within the sump was at a depth of 8.76 feet below ground surface. No product, odors or PID readings were identified.

KEC accessed the pump on February 1, 2010. The bottom was approximately 26 inches below the surface and dry. The bottom of the conduit was approximately 25 inches below the surface.

If you should have any questions please call.

Sincerely,

Konicek Environmental Consulting, LLC

Daily Summary (Work done, materials used, etc.)
NSEC was requested to respond to a fuel leak in the basement of Andy's Fuel Station on the corner of Good Hope and Teutonia. Gasoline had leaked into a 1" conduit from a fuel sump underneath a fuel dispensing pump. The fuel had traveled down the conduit and eventually leaked into the basement of the fuel station. Both ends of the conduit had been plugged with an epoxy but for some reason had let gas through. Once onsite NSEC coordinated with the Milwaukee Fire Department and the owner of the station. Both NSEC and the MFD sent two senior level responders into the basement to assess the situation, get air readings and start ventilation. The MFD left shortly after. Once ventilation was set up NSEC cut removed furniture and cut out a 10'x6' piece of carpet and pad. Odor suppressants and cleaning agents were applied to affected areas. NSEC worked with the electric company to vacate and clean the conduit of gasoline in order for the wires to be replaced. Small amounts of gasoline had seeped into the joint between the wall and the floor. NSEC removed the saturated felt material and applied a vapor suppressant and hydraulic cement into the joint. NSEC left site after the gasoline source was removed and cleaned. Ventilation would resume the next day.

RE: **Additional Information Request**

Commerce # 53209-2004-22-A DNR BRRTS # 02-41-542975
Andy's Gas Station, 7222 North Teutonia Avenue, Milwaukee

Dear Mr. Khullar:

On November 2, 2009, the Wisconsin Department of Commerce (Commerce) received a request for case closure prepared by your consultant, Konicek Environmental Consulting, LLC, for the site referenced above. Commerce has determined that this case cannot be closed until you provide additional information and address the following concerns:

1. Provide a site figure that includes the electric conduit(s), piping locations and the boring locations. Commerce cannot evaluate whether the placement of the soil boring GP-2/TW-1 was appropriate without knowing the location of the electrical conduit, as described in the text.
2. Provide additional information about the source of the release. Konicek indicated that the "southwestern most pump had about 1 inch of gasoline and that gasoline had traveled through an electrical conduit into the basement" of the building. How high from the bottom of the sump is the electrical conduit entry point? Generally, these conduits are located much higher than 1 inch from the bottom of the sump. Wouldn't the gasoline have had to submerge the conduit in order for sufficient product to be transported the distance to the basement of the building? What is the distance from this sump to the entry point in the basement? What is the depth of the conduit from the surface at the sump entry point?
3. Provide the repair records for the activities related to this release. Konicek indicated that the release was discovered on July 19, 2004.

Please provide the requested information by February 5, 2010. Commerce will evaluate whether additional activities are warranted at this site based upon the information you provide.

Thank you for your efforts to move this case toward closure. If you have any questions, please contact me in writing at the letterhead address or by telephone at (414) 357-4703.

Sincerely,

Linda M. Michalets

FID# 341114840
BRRTS #: 02-41-542975

Dear Mr. Delcore:

Konicek Environmental Consulting, LLC (KEC) on behalf of Anup Khullar is requesting closure of the above referenced case file.

On July 19, 2004 a release (BRRTS# 04-41-551765) of petroleum occurred that migrated through an electrical conduit into the building. The Milwaukee Fire Department and North Shore Environmental Construction, Inc. (NSEC) responded to the release and the case file for the spill was closed out. An ERP case was subsequently opened.

A LUST file was closed for the subject site under the Site Name of Heiser Leasing (BRRTS# 03-41-182137) in February 2004 by WDCOMM. The site was closed with residual soil and groundwater impacts. KEC reviewed the GIS information related to the LUST closure.

KEC interviewed NSEC to determine the location of the July 19, 2004 release. NSEC indicated that the sump under the southwestern most pump had about 1 inch of gasoline and that gasoline had traveled through an electrical conduit into the basement of the on site convenience store. NSEC indicated that conduit was cleaned and corrected and an approximate 10' by 6' area of carpet removed from inside the building.

In order to satisfy the August 3, 2005 "RP" letter from the WDNR, KEC conducted two soil probes in relation to the July 19, 2004 release. One probe was conducted within 5 feet of the release and one probe was conducted down gradient from the release that was also located near the electrical conduit between the release and the building. PVOC analysis conducted on a soil sample collected from a depth of 2 feet near the pump (GP-1), a soil sample collected down-gradient from a depth of 3 feet (GP-2/TW-1) and a groundwater sample (GP-2/TW-2) collected from the down-gradient probe indicate that the July 19, 2004 release did not have an impact on the soil and groundwater conditions of the subject property.

1032 S. Spring Street Port Washington, Wisconsin 53074 Tel: 262-284-2557 Fax: 262-284-1728

If you have any questions, please do not hesitate to call.

Sincerely,

Konicek Environmental Consulting, LLC

Site #9
Former Dry Cleaners (currently Walgreens)
7181 N. Teutonia Avenue
W. Good Hope Rd: STA 214+40 to 216+60 RT

The site is identified on the EDR historic cleaner database. Based on field reconnaissance, the site is currently a Walgreens store with parking lot. Review of the Milwaukee County GIS Map Server online indicated that the site is owned by DANIEL G. KAMIN NORTH TEUTONIA AVENUE, LLC [Ref. 1].

According to the Wisconsin Department of Agriculture, Trade and Consumer Protection (DATCP) Storage Tank Database there are no tanks registered to the site [Ref.2]. However, the EDR Historical Cleaner database indicates the site most likely had a dry cleaning operation on-site between 1970 and 1993.

According to the EDR report, no Sanborn Map coverage is available for the project corridor.

Himalayan's review of historical aerial photographs indicates that the site was a vacant lot until the 1960s. Between 1963 and 1990, the site has been occupied with a commercial building and parking lot that most likely included a dry cleaning facility. The building was either razed or renovated in the early-1990s and was redeveloped into a store and parking lot, currently utilized as a pharmacy / convenience store.

Geology / Hydrogeology

Based on the USDA NRCS soil survey report, soils along the site consist of Clayey land (Cv) [Ref. 3]. Clayey land is generally described as areas where development activities have either covered over or removed the original solum of the soil, therefore, native soil conditions are no longer present within the project corridor. This soil type is described as moderately well drained and the depth to groundwater is generally about 12 to 80 inches bgs.

Soil / Groundwater Impacts

Based on Himalayan's record search, it appears that no soil or groundwater analytical data are available for the site. However, the potential release of chlorinated solvents from the former dry cleaning operation could have possibly impacted local soil and groundwater conditions at the site.

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site.

Recommendations

Considering the historical land use (dry cleaning operation for over 20 years) and unknown subsurface conditions, this site could possibly impact the proposed improvements. Therefore, further investigation is recommended for the site.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

☐ Areas of fill ☐Stressed vegetation ☐ Pond(s) ☐ Basins/sumps ☐ Monitoring wells
☐ Soil borings
Comments:

Potential for Contaminant Migration: (attach supporting documentation such as plume maps, summaries of site investigation or closure reports).
☒ Property is a potential source of contamination
☐ Adjacent property is a potential source of contamination. Include site name or BRRTS number if known, describe location, include contaminant type and any additional information.
☐ Contaminated soil known to be within proposed right of way from tofeet below ground surface
☐ Contaminated groundwater known to be within proposed right of way at to feet below ground surface.
☐ Contaminated soil or groundwater within existing right of way. Attach copy of most recent investigation and plume maps.

Attachments – required
☒ Site photographs and a site map showing areas of concern
☐ Plat map showing parcel and any proposed areas of acquisition or easement
☐ Historic aerial photos of site - clearly outline site
☐ Historic WisDOT or other as-builts and plat maps - clearly outline site
☐ Plume maps for known contamination. Indicate existing or proposed right of way where applicable.

Recommendations
☒ No additional hazardous materials investigation is required.
☐ If construction or real estate requirements change, evaluation of need for further investigation will be necessary.
☒ Information is sufficient to use Standard Special Provisions. Copy of completed Standard Special Provision is attached.
☐ Conduct additional investigation
- ☐ Phase 2 (determine if contamination is present)
- ☐ Phase 2.5 (determine extent of contamination within existing R/W only)
- ☐ Phase 3 (determine full extent of contamination prior to acquisition)
- ☐ Phase 4 (remediate site)
- ☐ Other (describe)

Recommendations accepted by (name and title): on

Signature: _____

A check in a checkbox indicates a positive or “yes” response

Site #10
Former Service Station (Currently PNC Bank)
7001 – 7005 W. Port Washington Road
N. Port Washington Rd: STA 13+25 to 15+20 LT

The site is identified on the EDR Historical Auto, UST, LUST(BRRTS# 03-41-551012), CRS, and AUL database. Based on field reconnaissance, the site is currently occupied by PNC Bank. Review of the Milwaukee County GIS & Land Information Interactive Map online indicates the site is owned by National Tax Search, LLC [Ref.1].

According to the Wisconsin Department of Agriculture, Trade and Consumer Protection (DATCP) Storage Tank Database there weretwo tanks are registered to the site [Ref.2]. In July 1974, two 4,000-gallon leaded gasoline USTs were closed / removed. The occupancy for all tanks is listed as 'retail fuel sales' [Ref.2].

According to the EDR report, no Sanborn Map coverage is available for the project corridor.

Himalayan's review of historical aerial photographs indicate the site was a vacant lot until the 1950s when a commercial building and a parking lot with two pump islands were developed in the northwest corner of W. Green Tree Road and N. Port Washington Road. By 1975, the commercial building was razed and a new commercial building was constructed on the site. The commercial building was then razed and replaced with a new commercial building in 2015 and the site has remained the same since.

BRRTS #03-41-551012: In February 1991, the site owner received a notification of hazardous substances discharged at the site from the operation of the former gas station service [Ref.3]. Based on a report by Sigma Environmental Service, Inc. (Sigma), fourteen borings (B-1 to B-4, GP-1 to GP-10) were advanced at the sitebetweenNovember 2007 and March 2008 with a maximum depth of 14ft bgs. Four borings were converted to groundwater monitoring wells (MW-1 to MW-4). Soiland groundwater samples were analyzed for GROs, PVOCs, and lead [Ref. 3].

Based on Sigma's investigation, contaminated soil exceeding NR 720 RCLs and contaminated groundwater exceeding NR 140 PAL remains primarily on the east side of the site. According to Sigma, shallow soil / groundwater contamination appears to remain within the former UST and gas dispenser areas. Sigma also concluded that the plume is stable and should not pose a risk to humans or the environment. In July 2009, the activity was conditionally closed by the Wisconsin Department of Commerce with land use limitations to address direct contact risk and a cap maintenance plan [Ref.4].

Geology / Hydrogeology

Based on Sigma's report, soils at the site consisted of mainly silt and clay from the ground surface to 16 feet bgs. The depth of groundwater ranged from 5 to 16 feet bgs. The groundwater flow was not determined due to static water levels [Ref.3].

Based on the USDA NRCS soil survey report, soils along the site consist of Clayey land (Cv). Clayey land is generally described as areas where development activities have either covered over or removed the original solum of the soil, therefore, native soil conditions are no longer present within the project corridor. This soil type is described as moderately well drained and the depth to groundwater is generally about 12 to 80 inches bgs[Ref.5]

Soil Impacts

According to Sigma's report, no impacted soil has been removed from the site. Soil borings B-2, GP-1, GP-3, GP-8, and GP-10 at depths ranging from 0 to 14 feet bgs had GRO (113 to 1670 mg/kg), lead (5 to 87 mg/kg), benzene (41 to 21,100 µg/kg), ethylbenzene (58 to 58,000 µg/kg), toluene (60 to 136,000 µg/kg), and xylene (234 to 179,000 µg/kg) exceeding their respective NR 720 RCLs [Ref. 3]

It appears impacted soil is shallow (2-10 feet bgs) and the distance of residual soilcontamination exceeding NR 720 RCLs is approximately 100 feet from the W. Green Tree Road and N. Port Washington Avenue intersection.

Groundwater Impacts

Based on the most recent groundwater sampling event in October 2008, MW-1 and MW-2 had benzene (1.2 to 2.44 µg/L) and chloromethane (1.49 J and 1.68 µg/L) exceeding their respective NR 140 PAL. MW-1and MW-3 had concentrations of 1,2-dichloroethane (0.75 J to 0.87 J) exceeding NR 140 PAL. MW-1 also had a naphthalene concentration (38 µg/L) that exceeded NR 140 PAL [Ref.3].

It appears that the groundwater contaminant plume remains on site and is approximately 100 feet from the W. Green Tree Road and N. Port Washington Road intersection.

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site.

Recommendations

Considering that the impacted soil and groundwater contaminant plume are approximately 100 feet from the project intersection and is possibly confined to a small area, this site should not impact the proposed improvements. Therefore, further investigation is not recommended for the site.

However, a special provision (STSP 107/100) should be considered for the site. A "Notice to Contractor" should be included in the special provisions of the let contract indicating that potential soil contamination could be encountered during construction at the site due to shallow soilcontamination remaining on-site.

The need for further investigation could be re-evaluated once construction and/or real estate requirements have been finalized.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

GIS Registry Checklist

This Adobe Fillable form is intended to provide a list of information that is required for evaluation for case closure. It is to be used in conjunction with Form 4400-202, Case Closure Request. The closure of a case means that the Department has determined that no further response is required at that time based on the information that has been submitted to the Department.

NOTICE: Completion of this form is mandatory for applications for case closure pursuant to ch. 292, Wis. Stats. and ch. NR 726, Wis. Adm. Code, including cases closed under ch. NR 746 and ch. NR 726. The Department will not consider, or act upon your application, unless all applicable sections are completed on this form and the closure fee and any other applicable fees, required under ch. NR 749, Wis. Adm. Code, Table 1 are included. It is not the Department's intention to use any personally identifiable information from this form for any purpose other than reviewing closure requests and determining the need for additional response action. The Department may provide this information to requesters as required by Wisconsin's Open Records law [ss. 19.31 - 19.39, Wis. Stats.].

BRRTS #: 03-41-551012 PARCEL ID #: 128-8960-002

ACTIVITY NAME: Former Service Station WTM COORDINATES: X: 689676 Y: 298956

CLOSURE DOCUMENTS (the Department adds these items to the final GIS packet for posting on the Registry)

☒ **Closure Letter**

☐ **Maintenance Plan** *(if activity is closed with a land use limitation or condition (land use control) under s. 292.12, Wis. Stats.)*

☒ **Conditional Closure Letter**

☐ **Certificate of Completion (COC)** for VPLE sites

SOURCE LEGAL DOCUMENTS

☒ **Deed:** The most recent deed as well as legal descriptions, for the **Source Property** (where the contamination originated). Deeds for other, off-source (off-site) properties are located in the **Notification** section.
Note: *If a property has been purchased with a land contract and the purchaser has not yet received a deed, a copy of the land contract which includes the legal description shall be submitted instead of the most recent deed. If the property has been inherited, written documentation of the property transfer should be submitted along with the most recent deed.*

☐ **Certified Survey Map:** A copy of the certified survey map or the relevant section of the recorded plat map *for those properties where the legal description in the most recent deed refers to a certified survey map or a recorded plat map.* (lots on subdivided or platted property (e.g. lot 2 of xyz subdivision)).

Figure #: **Title:**

☒ **Signed Statement:** A statement signed by the Responsible Party (RP), which states that he or she believes that the attached legal description accurately describes the correct contaminated property.

MAPS (meeting the visual aid requirements of s. NR 716.15(2)(h))

Maps must be no larger than 8.5 x 14 inches unless the map is submitted electronically.

☒ **Location Map:** A map outlining all properties within the contaminated site boundaries on a U.S.G.S. topographic map or plat map in sufficient detail to permit easy location of all parcels. If groundwater standards are exceeded, include the location of all potable wells within 1200 feet of the site.
Note: *Due to security reasons municipal wells are not identified on GIS Packet maps. However, the locations of these municipal wells must be identified on Case Closure Request maps.*

Figure #: 1 **Title: Site Location Map**

☒ **Detailed Site Map:** A map that shows all relevant features (buildings, roads, individual property boundaries, contaminant sources, utility lines, monitoring wells and potable wells) within the contaminated area. This map is to show the location of all contaminated public streets, and highway and railroad rights-of-way in relation to the source property and in relation to the boundaries of groundwater contamination exceeding a ch. NR 140 Enforcement Standard (ES), and/or in relation to the boundaries of soil contamination exceeding a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Levels (SSRCL) as determined under s. NR 720.09, 720.11 and 720.19.

Figure #: 2 **Title: Site Plan Map**

☒ **Soil Contamination Contour Map:** For sites closing with residual soil contamination, this map is to show the location of all contaminated soil and a single contour showing the horizontal extent of each area of contiguous residual soil contamination that exceeds a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Level (SSRCL)as determined under s. NR 720.09, 720.11 and 720.19.

Figure #: 3 **Title: Soil Quality Map**

BRRTS #: 03-41-551012 ACTIVITY NAME: Former Service Station

MAPS (continued)

☐ **Geologic Cross-Section Map:** A map showing the source location and vertical extent of residual soil contamination exceeding a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Level (SSRCL). If groundwater contamination exceeds a ch. NR 140 Enforcement Standard (ES) when closure is requested, show the source location and vertical extent, water table and piezometric elevations, and locations and elevations of geologic units, bedrock and confining units, if any.

Figure #: **Title:**

Figure #: **Title:**

☒ **Groundwater Isoconcentration Map:** For sites closing with residual groundwater contamination, this map shows the horizontal extent of all groundwater contamination exceeding a ch. NR140 Preventive Action Limit (PAL) and an Enforcement Standard (ES). Indicate the direction and date of groundwater flow, based on the most recent sampling data.
Note: *This is intended to show the total area of contaminated groundwater.*

Figure #: 4 **Title: Groundwater Quality Map**

☐ **Groundwater Flow Direction Map:** A map that represents groundwater movement at the site. If the flow direction varies by more then 20° over the history of the site, submit 2 groundwater flow maps showing the maximum variation in flow direction.

Figure #: **Title:**

Figure #: **Title:**

TABLES (meeting the requirements of s. NR 716.15(2)(h)(3))

Tables must be no larger than 8.5 x 14 inches unless the table is submitted electronically. Tables must not contain shading and/or cross-hatching. The use of **BOLD** or *ITALICS* is acceptable.

☒ **Soil Analytical Table:** A table showing remaining soil contamination with analytical results and collection dates.
Note: This is one table of results for the contaminants of concern. Contaminants of concern are those that were found during the site investigation, that remain after remediation. It may be necessary to create a new table to meet this requirement.

Table #: 1 **Title: Soil Analytical Quality Results**

☒ **Groundwater Analytical Table:** Table(s) that show the most recent analytical results and collection dates, for all monitoring wells and any potable wells for which samples have been collected.

Table #: 3 **Title: Groundwater Quality Analytical Results**

☒ **Water Level Elevations:** Table(s) that show the previous four (at minimum) water level elevation measurements/dates from all monitoring wells. If present, free product is to be noted on the table.

Table #: 2 **Title: Static Groundwater Elevations**

IMPROPERLY ABANDONED MONITORING WELLS

For each monitoring well not properly abandoned according to requirements of s. NR 141.25 include the following documents.
Note: *If the site is being listed on the GIS Registry for only an improperly abandoned monitoring well you will only need to submit the documents in this section for the GIS Registry Packet.*

☒ **Not Applicable**

☐ **Site Location Map:** A map showing all surveyed monitoring wells with specific identification of the monitoring wells which have not been properly abandoned.
Note: *If the applicable monitoring wells are distinctly identified on the Detailed Site Map this Site Location Map is not needed.*

Figure #: **Title:**

☐ **Well Construction Report:** Form 4440-113A for the applicable monitoring wells.

☐ **Deed:** The most recent deed as well as legal descriptions for each property where a monitoring well was not properly abandoned.

☐ **Notification Letter:** Copy of the notification letter to the affected property owner(s).

BRRTS #: 03-41-551012 ACTIVITY NAME: Former Service Station

NOTIFICATIONS

Source Property

☐ **Letter To Current Source Property Owner:** If the source property is owned by someone other than the person who is applying for case closure, include a copy of the letter notifying the current owner of the source property that case closure has been requested.

☐ **Return Receipt/Signature Confirmation:** Written proof of date on which confirmation was received for notifying current source property owner.

Off-Source Property

Group the following information per individual property and label each group according to alphabetic listing on the "Impacted Off-Source Property" attachment.

☐ **Letter To "Off-Source" Property Owners:** Copies of all letters sent by the Responsible Party (RP) to owners of properties with groundwater exceeding an Enforcement Standard (ES), and to owners of properties that will be affected by a land use control under s. 292.12, Wis. Stats.
Note: *Letters sent to off-source properties regarding residual contamination must contain standard provisions in Appendix A of ch. NR 726.*

Number of "Off-Source" Letters:

☐ **Return Receipt/Signature Confirmation:** Written proof of date on which confirmation was received for notifying any off-source property owner.

☐ **Deed of "Off-Source" Property:** The most recent deed(s) as well as legal descriptions, for all affected deeded **off-source property(ies).** This does not apply to right-of-ways.
Note: *If a property has been purchased with a land contract and the purchaser has not yet received a deed, a copy of the land contract which includes the legal description shall be submitted instead of the most recent deed. If the property has been inherited, written documentation of the property transfer should be submitted along with the most recent deed.*

☐ **Letter To "Governmental Unit/Right-Of-Way" Owners:** Copies of all letters sent by the Responsible Party (RP) to a city, village, municipality, state agency or any other entity responsible for maintenance of a public street, highway, or railroad right-of-way, within or partially within the contaminated area, for contamination exceeding a groundwater Enforcement Standard (ES) and/or soil exceeding a Residual Contaminant Level (RCL) or a Site Specific Residual Contaminant Level (SSRCL).

Number of "Governmental Unit/Right-Of-Way Owner" Letters:

WARRANTY DEED © 2003 STATE BAR OF WISCONSIN FORM NO 1-2003

* Type name below signatures

ADDENDUM TO WARRANTY DEED

All that part of the North 1/2 of the Northeast 1/4 of Section 20, Town 8 North, Range 22 East, in the City of Glendale, County of Milwaukee, State of Wisconsin, bounded and described as follows

Commencing at the Southwest corner of said 1/4 Section, thence North 00° 11' 15" West along the West line of said 1/4 Section 1,324 195 feet to a point, said point being on the South line of the North 1/2 of said 1/4 Section, thence North 89° 32' 30" East along the South line of North 1/2 of said 1/4 Section 366 63 feet to a point, said point being 425 37 feet South 89° 32' 30" West of the center line of North Port Washington Road, thence North 00° 11' 15" West and parallel with the West line of said 1/4 Section 60 00 feet to the point of beginning of the land to be described; thence continuing North 00° 11' 15" West and parallel with the West line of said 1/4 Section 169 35 feet to a point, thence North 89° 32' 30" East and parallel with the South line of the North 1/2 of said 1/4 Section 224 85 feet to a point, said point being 136 50 feet (measured) South 89° 32' 30" West of the center line of said road, thence South 15° 48' 11" East and parallel with the center line of said Road 51 85 feet to a point, said point being 179 35 feet North of the South line of the North 1/2 of said 1/4 Section, thence North 89° 32' 30" East and parallel with the South line of the North 1/2 of said 1/4 Section 102 28 feet to a point, said point being 33 00 feet Westerly, measured at right angles, of the center line of said road, thence South 15° 48' 11" East and parallel with the center line of North Port Washington Road 151 76 feet to a point, said point being 33 00 feet North of the South line of the North 1/2 of said 1/4 Section; thence South 89° 32' 30" West and parallel with the South line of the North 1/2 of said 1/4 Section 143 13 feet to a point, thence North 00° 11' 15" West and parallel with the West line of said 1/4 Section 27 00 feet to a point, thence South 89° 32' 30" West and parallel with the South line of the North 1/2 of said 1/4 Section 238 81 feet to the point of beginning

ALSO,

The North 15 feet of the South 60 feet (as measured at right angles to the South line of the said Northwest 1/4 of the Northeast 1/4) of the East 239.14 feet of the West 605 77 feet of the Northwest 1/4 of said Northeast 1/4

EXCEPTING THEREFROM that part thereof described in Warranty Deed recorded as Document No 5564286 and that part described in Warranty Deed recorded as Document No 9402746

Tax Key No 128-8960-002

STATEMENT BY RESPONSIBLE PARTY

Mr. Rachit Dhingra, a representative of ANR Capital, the responsible party for the property located at 7001 North Port Washington Road, Glendale, Wisconsin, states that the legal descriptions for the property to be listed in the GIS Registry provided to the Wisconsin Department of Commerce in this case closure request/GIS Registry packet for Wisconsin Department of Natural Resources BRRTS #03-41-551012 are complete and accurate to the best of our knowledge.

Signature of Representative for Responsible Party

Soil Quality Legend

Detects Only. PVOC results are reported in micrograms per kilogram (ug/kg). Lead and GRO resultes are reported in milligrams per kilogram (mg/kg)

ND = Petroleum constituent concentrations are below the laboratory detection limit
GRO = Gasoline Range Organics
TMB = Trimethylbezene
NR 720 RCL = Wisconsin Administrative Code, Chapter NR 720 generic Residual Contaminant Level (industrial land use RCLs for RCRA metals).
COMM 46 = Wisconsin Administrative Code, Chapter COMM 46, Table 1 soil screening Table 1 level: Indicators of Residual Petroleum Products in Soil Pores.
COMM 46 = Wisconsin Administrative Code, Chapter COMM 46, Table 2 soil screening Table 2 level: Protection of Human Health from Direct Contact.
Bold = Concentrations are greater than NR 720 RCL
Underline = Concentrations are greater than COMM 46 Table 1
Italics = Concentrations are greater than COMM 46 Table 2

RE: **Final Closure with Land Use Limitation to Address Direct Contact Risk**

Commerce # 53217-3839-01-A DNR BRRTS # 03-41-551012
Service Station (Former), 7001 North Port Washington Road, Glendale

Dear Mr. Dhingra:

The Wisconsin Department of Commerce (Commerce) has determined that this site does not pose a significant threat to human health and the environment as long as current and subsequent property owners adhere to the following limitation:

> The barrier cap must be maintained in the vicinity of the former dispenser islands, which includes geoprobe soil borings GP-3 and GP-5 as shown on the attached *Figure 3 Soil Quality Map*.

Commerce has the authority per section 292.12(2), Wis. Stats., to require the maintenance of a barrier cap at this property. Failure to adhere to this limitation may result in financial penalties from $10 to $5,000 per day in accordance with section 292.99(1), Wis. Stats. Commerce may conduct inspections to ensure compliance with the maintenance requirement. In the future, you may request that Commerce review *new* information to determine if the cap requirement can be changed or removed.

The following activities are prohibited on any portion of the property where the pavement barrier is required unless prior written approval has been obtained from Commerce: 1) removal of the existing barrier; 2) replacement with another barrier; 3) excavating or grading of the land surface; 4) filling on capped or paved areas; 5) plowing for agricultural cultivation; or 6) construction or placement of a building or other structure.

This site is now listed as "closed" on the Commerce database and will be included on the Department of Natural Resources (DNR) Geographic Information System (GIS) Registry of Closed Remediation Sites to address residual soil and groundwater contamination. To review all sites on the GIS Registry web page, visit http://dnr.wi.gov/org/aw/rr/gis/index.htm. It is in your best interest to keep all documentation related to the environmental activities at your site.

If you intend to construct or reconstruct a potable well on this property, you must get prior DNR approval. To obtain approval, complete Form 3300-254, GIS Registry Site Well Approval Application, and submit it to the DNR Drinking and Groundwater program's regional water supply specialist. This form can be obtained on-line at http://www.dnr.state.wi.us/org/water/dwg/3300254.pdf or through the GIS Registry web address listed above.

All current and future owners and occupants of the property need to be aware that excavation of contaminated soil may pose a hazard. Special precautions may be needed to prevent inhalation, ingestion or dermal contact with the residual contamination when it is removed. If soil is excavated, the

property owner at the time of excavation must have the soil sampled and analyzed to determine if residual contamination remains. If sampling confirms that contamination is present, the property owner at the time of excavation must determine whether the material would be considered solid or hazardous waste and ensure that any storage, treatment or disposal is in compliance with applicable State regulations and standards.

Depending on site-specific conditions, construction over contaminated materials may result in vapor migration into enclosed structures or along newly placed underground utility lines. The potential for vapor inhalation and mitigation should be evaluated when planning any future redevelopment, and measures should be taken to ensure the continued protection of public health, safety, welfare and the environment at the site.

Costs for sampling and excavation activities conducted after case closure are not eligible for PECFA reimbursement. However, if it is determined that any undisturbed remaining petroleum contamination poses a threat, the case may be reopened and further investigation or remediation may be required. If this case is reopened, any original claim under the PECFA fund would also reopen and you may apply for assistance to the extent of remaining eligibility.

Thank you for your efforts to protect Wisconsin's environment. If you have any questions, please contact me in writing at the letterhead address or by telephone at (414) 357-4705.

Sincerely,

Monica Weis

Re: Conditional Case Closure – Well Abandonment Activities
Service Station (Former) — COMM #53217-3839-01A
7001 North Port Washington Road — BRRTS #03-41-551012
Glendale, Wisconsin — FID #341158400

Dear Ms. Weis,

Sigma Environmental Services, Inc. on behalf of ANR Capital has completed site-wide monitoring well abandonment activities as a condition of closure required by the Wisconsin Department of Commerce (COMM) in the Conditional Case Closure letter dated March 10, 2009.

A copy of the Well/Drillhole/Borehole Abandonment form #3300-5B for each well installed as part of the subsurface investigation at the former service station property located at 7001 North Port Washington Road in Glendale, Wisconsin, is attached. Please issue a final Case Closure letter as the conditions for closure as outlined in your March 10, 2009 letter have been satisfied. If you have any questions, please call Timothy Wimmer or myself at (414) 643-4200

Respectfully Submitted,

EXECUTIVE SUMMARY

Sigma Environmental Services, Inc. (Sigma) was retained by ANR Capital in March 2008 to conduct a subsurface investigation at the former service station property located at 7001 North Port Washington Road, Glendale, Wisconsin (hereinafter "the site"). The purpose of the subsurface investigation was to 1) define the nature and extent of petroleum hydrocarbon impacts to soil and groundwater beneath the site associated with the former underground storage tank (UST) system; 2) satisfy the requirements of Wisconsin Administrative Code, Chapter NR 716.05 for subsurface investigations; 3) generate sufficient geologic and hydrogeologic data to evaluate risks to the surrounding environment and human health; and 4) provide a recommendation for future remedial activities or case closure, as appropriate.

From November 2006 through November 2007 Northern Environmental Technologies, Inc. (Northern) completed environmental site assessment activities, including a Phase I and limited Phase II, as a part of the property transaction at the site. The Phase I ESA identified the site as a former gasoline filling station. Documentation of the installation, removal, and/or location of the former gasoline USTs and dispenser was not identified during the Phase I activities.

Following the results of the Phase I ESA, a limited Phase II investigation, consisting of soil boring advancement activities within the southeastern corner of the property was conducted by Northern to identify if potential impacts associated with the former operation of a gasoline UST system are present and to determine the location of the associated gasoline USTs. The limited Phase II ESA revealed the presence of soil impacts at concentrations greater than the NR 720 residual contaminant level (RCL) within the soil samples collected from soil boring B1. In addition pea gravel, a material often used as backfill around USTs, was observed within the soil borings advanced south for the former service station building (B1 and B2).

The results of the Phase II suggested a release associated with the former gasoline storage and dispensing system occurred at the site. Therefore on behalf of Judy Leung, the former owner of the property, Sigma notified the Wisconsin Department of Natural Resources (WDNR) of the release on January 4, 2008.

In addition, based on the observed pea gravel, lack of drilling refusal, and/or identified soil impacts, it was determined that the gasoline USTs associated with the former service station were historically present within the vicinity of Geoprobe borings B1 and B2 and were likely removed during the demolition of the former service station building in 1974. The Wisconsin Department of Commerce was notified of the UST status in March 2008 and the former leaded gasoline USTs associated with the site are currently registered as removed.

Due to the soil impacts identified during the limited site investigation conducted by Northern, Sigma expanded the Phase II investigation by conducting a supplemental Geoprobe investigation and installing four NR 141 compliant groundwater monitoring wells. Two soil samples were collected from each Geoprobe soil boring and submitted for laboratory analysis of gasoline range organics (GRO), petroleum volatile organic compounds (PVOCs) and/or lead. In addition one groundwater sample was collected from each monitoring well and submitted for laboratory analysis of volatile organic compounds (VOCs) and dissolved lead.

A review of the site-wide investigation results indicates that select PVOCs at concentrations greater than the respective state standards were reported within the soil samples collected at soil borings B1, GP-1, GP-3 and GP-5. In addition lead was detected at a concentration greater than the non-industrial RCL within the shallow soil sample collected from soil boring GP-8. Groundwater laboratory analytical results indicate that contaminant concentrations were not detected above the NR 140 enforcement standard (ES) at any of the groundwater samples collected from the NR 141 compliant monitoring wells (MW-1 through MW-4). However, select VOCs including benzene, chloromethane, 1,2-dichloroethane, and/or naphthalene were detected at concentrations slightly greater than the NR 140 preventative action limits (PAL) within the groundwater samples collected from monitoring wells MW-1, MW-2, and/or MW-3.

Contaminant concentrations within the soil and groundwater resulting from the former operation of a gasoline service station appear minimal and do not appear to warrant further investigation. Subsequently, Sigma on behalf of ANR Capital requests the Wisconsin Department of Commerce grant case closure at the site.

1. INTRODUCTION

Sigma Environmental Services, Inc. (Sigma) was retained by ANR Capital in March 2008 to conduct a subsurface investigation at the former service station property located at 7001 North Port Washington Road, Glendale, Wisconsin (hereafter "the site"). The purpose of the subsurface investigation was to 1) define the nature and extent of petroleum hydrocarbon impacts to soil and groundwater beneath the site associated with the former underground storage tank (UST) system; 2) satisfy the requirements of Wisconsin Administrative Code, Chapter NR 716.05 for subsurface investigations; 3) generate sufficient geologic and hydrogeologic data to evaluate risks to the surrounding environment and human health; and 4) provide a recommendation for future remedial activities or case closure, as appropriate.

1.1 Background. On November 16, 2006 Northern Environmental Technologies, Inc. (Northern) was retained by ANR Capital to complete environmental site assessment activities, including a Phase I and limited Phase II, as a part of the property transaction for the site. The Phase I ESA identified the site as a former gasoline filling station. Documentation of the installation, removal, and/or location of the former gasoline UST and dispenser was not identified during the Phase I activities.

On November 19, 2007, Northern initiated a limited Phase II investigation which consisted of soil boring advancement activities within the southeastern corner of the property to identify if potential impacts associated with the former operation of a gasoline UST system are present and to determine the location of the associated gasoline USTs. Specifically two soil borings (B1 and B2) were completed to a depth of 10 feet below ground surface (bgs) and two soil borings (B3 and B4) were completed to a depth of 4 feet bgs. One soil sample per soil boring location was submitted for laboratory analysis of gasoline range organics (GRO) and petroleum volatile organic compounds (PVOCs) or volatile organic compounds (VOCs).

The soil sample collected at a depth of 6 to 8 feet bgs from boring B1 contained GRO (299 milligrams per kilogram [mg/kg]) and benzene (350 micrograms per kilogram [ug/kg]) at concentrations greater than the respective NR 720 Residual Contaminant Level (RCL) (**Table 1A**). Select PVOCs, typical of gasoline contamination, were also detected within the soil sample collected from soil boring B1 and B2 at concentrations below the applicable NR 720 RCLs. In addition, pea gravel typically used as backfill around USTs was encountered at soil borings B1 and B2. Soil descriptions provided by Northern are including in **Appendix A**.

The results of the Phase II suggested that a release associated with the former gasoline storage and dispensing system occurred at the site. Therefore on behalf of Judy Leung, the former owner of the property, Sigma notified the Wisconsin Department of Natural Resources (WDNR) of the release on January 4, 2008.

In addition, based on the observed pea gravel, lack of drilling refusal, and/or identified soil impacts, Sigma determined that the former gasoline USTs associated with the former service station were present within the vicinity of Geoprobe borings B1 and B2 and were likely removed during the demolition of the former service station building in 1974. The Wisconsin Department of Commerce was notified of the UST status in March 2008 and the former leaded gasoline USTs associated with the site are currently registered as removed.

1.2 General Discussion. Sigma has prepared this report to document and discuss subsurface investigation activities, present investigation results, and provide an

interpretation of the data generated and how it relates to established State of Wisconsin rules and regulations. All investigation activities were completed in accordance with Wisconsin rules and regulations at the time work was preformed; specifically, Wisconsin Administrative Code, Chapter NR 700 through NR 747 (Chapter NR 700-747), Wisconsin Administrative Code, Chapter NR 140 (Chapter NR 140), and Wisconsin Administrative Code, Chapter NR 141 (Chapter NR 141).

2. PURPOSE AND SCOPE OF WORK

2.1 **Purpose of Work**. The purpose of Sigma's investigation was to 1) define the nature and extent of petroleum hydrocarbon impacts to soil and groundwater beneath the site associated with the former UST system; 2) satisfy the requirements of Chapter NR 716.05 for subsurface investigations; 3) generate sufficient geologic and hydrogeologic data to evaluate remedial options; 4) evaluate potential risk to human health and the surrounding environment; and 5) provide recommendations for future remedial activities or case closure, as appropriate.

2.2 **Scope of Work**. Sigma's scope of work for this project included an evaluation of the presence, type, and extent of petroleum hydrocarbon impacts to the soil and groundwater in addition to a determination of the subsurface characteristics (soil types and hydrogeologic conditions). The following activities were completed relevant to the subsurface investigation activities at the site:

- On May 22, 2008, Sigma advanced eight Geoprobe soil borings to depths ranging from 12 to 16 feet below ground surface (bgs). Soil borings were strategically located across the site to identify potential subsurface impacts associated with the operation of the former gasoline service station, specifically the former UST, underground product lines, and dispenser areas. Two soil samples were collected from each Geoprobe soil boring for laboratory analysis of gasoline range organics (GRO), petroleum volatile organic compounds (PVOCs), and total lead.

  Following soil boring advancement activities, one soil boring, located within the identified former UST area, was converted into a temporary groundwater monitoring well. One groundwater sample was collected from the temporary groundwater monitoring well for laboratory analysis of GRO and PVOC.

- On September 4, 2008, Sigma observed the drilling and installation of four groundwater monitoring wells to depths ranging from 17.5 to 18.5 feet bgs. Groundwater monitoring wells were located within and surrounding the identified soil impact areas to determine the groundwater quality at the site. In addition, one Geoprobe soil boring was advanced immediately west of the Port Washington Road Right-of-way to determine if impacts extend off-site to the east. Two soil samples were collected from the Geoprobe soil boring and monitoring well MW-4 for laboratory analysis of GRO and PVOCs.

- Groundwater samples were collected from the monitoring well network on October 14, 2008 and submitted for laboratory analysis of Volatile Organic Compounds (VOCs), and dissolved lead.

2.3 **Project Team**. The following firms and contractors provided services during remedial investigation activities completed at the site:

Sun Prairie, Wisconsin 53590
Telephone: (608) 837-8992

Laboratory Services:
Synergy Environmental Lab, Inc.
1990 Prospect Court
Appleton, Wisconsin 54914
Telephone: (920) 830-2455

3. SITE AND SURROUNDING AREA DESCRIPTION

3.1 **Site Location and Description**. The subject property is located in the Northwest ¼ of the Northeast ¼ of Section 20, Township 8 North, Range 22 East, Village of Glendale, County of Milwaukee, State of Wisconsin at an elevation of approximately 680 feet above mean sea level (msl). The site location is shown on Figure 1.

The site is located on the northwest corner of Green Tree Road and Port Washington Road. The site is generally surrounded by commercial properties. Specifically, a gasoline station (gained case closure from WDNR in August 2003) is located east across Port Washington, a hotel property adjoins the site to the north and east, and a strip mall is present to the south across Green Tree Road.

3.1.1 Land Use. Prior to 1974 the site was occupied by a gasoline service station. The service station building was razed in 1974 and the current structure, a Chinese restaurant was built in 1975. The site and associated building are currently vacant.

3.1.2 Utility Review. Based on information obtained by Diggers Hotline markings, a professional survey, and site inspection by Sigma personnel, utilities such as underground electric, gas, water, and sewer are present within the investigative area. Utility locations are depicted on **Figure 2**. The property is supplied water from the North Shore Water Commission which obtains its water from Lake Michigan.

3.1.3 Potential Receptors. The closest surface body of water is the Milwaukee River located approximately 2,500 feet south/southwest of the site. Lake Michigan is

located approximately 5,000 feet east of the site. A review of well constructor logs obtained from the Wisconsin Geological and Natural History Survey and Wisconsin Department of Natural Resources and dating back to 1939 for section 20 (north ½) of Township 8 North, Range 22 East indicates that 45 private wells may be located within 1200 feet of the site. The exact private well locations are unknown. Groundwater concentrations were not detected at concentrations greater than the NR 140 enforcement standard (ES) within any of the groundwater samples collected from NR 141 compliant monitoring wells at the site, therefore private wells do not appear to be at risk of receiving impacted water from the site. Private well logs are presented as **Appendix B**.

4. INVESTIGATIVE PROCEDURES

Sigma completed a subsurface investigation at the site that consisted of the Geoprobe soil assessment followed by the installation of four groundwater monitoring wells to assess groundwater quality at the site. Upon completion of monitoring well installation activities, the monitoring wells were developed and sampled. The following is a detailed discussion of investigation activities and methodologies.

4.1 **Geoprobe Soil Boring Assessment Activities (Sigma)**. On May 22, 2008 Sigma advanced eight Geoprobe soil borings (GP-1 through GP-8) at the site to identify potential impacts associated with the former operation of a gasoline service station. The soil borings were advanced to depths ranging from 12 to 16 feet below ground surface (bgs) and were strategically placed across the site to identify potential subsurface impacts associated with the former USTs, underground product lines, and dispenser area. During the soil boring advancement, soil samples were collected on a continuous basis and described on the basis of color, texture, grain size, and plasticity, and classified in accordance with the Unified Soil Classification System (USCS). Each of the soil samples were containerized for headspace analysis using the photo ionization detector periodically calibrated for direct response to 100 parts per million isobutylene in air. Field screening results, soil classifications, sampling intervals, and descriptions are presented on the Soil Boring Logs in **Appendix C**.

Two soil samples per soil boring were containerized for laboratory analysis of gasoline range organics (GRO), petroleum volatile organic compounds (PVOCs), and total lead. Following the soil sample collection at Geoprobe soil boring GP-1, Sigma installed a temporary groundwater monitoring well complete with a one-inch diameter PVC screen placed from 4 to 14 feet bgs. One grab sample was collected from the temporary monitoring well (TW-1) for laboratory analysis of GRO and PVOC. Following sample collection activities, each soil boring was abandoned in accordance with Chapter NR 141. Soil boring abandonment forms are presented in **Appendix D**. Soil boring locations are depicted on the Site Plan Map, **Figure 2**.

4.2 **Supplemental Geoprobe Soil Boring Advancement/Monitoring Well Installation**. Select PVOCs were identified at concentrations greater than the state standards within soil samples collected from select soil borings advanced during the May 2008 Geoprobe assessment. In addition, benzene was detected at a concentration of 6.7 micrograms per liter (µg/l), slightly greater than the Chapter NR 140 Enforcement Standard (ES), within the groundwater sample collected from the temporary well TW-1. Due to the identified impacts, Sigma oversaw the installation of four groundwater monitoring wells (MW-1 through MW-4) on September 4, 2008 to further assess the groundwater quality at the site. In addition, Sigma oversaw the advancement of one Geoprobe soil boring

(GP-10) located immediately west of the Port Washington Road Right-of-way to determine if impacts extend off-site to the east.

Geoprobe soil boring GP-10 was advanced to approximately 15 feet bgs using a truck-mounted Geoprobe rig. Each of the groundwater monitoring well locations were blind drilled using 4.25-inch hollow stem augers to a depth of 18.5 feet bgs, with the exception of monitoring well MW-4/GP-9 which was continuously sampled to a depth of 17.5 feet bgs. Soil samples collected on a continuous basis from soil boring GP-10 and monitoring well MW-4/GP-9 were described on the basis of color, texture, grain size, and plasticity, and classified in accordance with the Unified Soil Classification System (USCS). Each of the soil samples were containerized for headspace analysis using the photo ionization detector periodically calibrated for direct response to 100 parts per million isobutylene in air. Two of the soil samples collected from soil borings GP-10 and MW-4/GP-9 were containerized for laboratory analysis of PVOCs and total lead. Field screening results, soil classifications, sampling intervals, and descriptions are presented on the Soil Boring Logs in **Appendix C**.

Following drilling activities, each monitoring well was installed with a ten foot section of two-inch diameter PVC screen. Monitoring well Construction forms are presented as **Appendix E**.

Upon completion of monitoring well installation, Sigma personnel developed monitoring wells MW-1 on September 15, 2008 in accordance with Chapter NR 141 by alternately surging and bailing the wells with clean Teflon bailers and evacuation water and sediment from the wells with a decontaminated peristaltic pump. A recoverable volume of groundwater was not present at monitoring wells MW-2 through MW-4 during the development activities on September 15, 2008 therefore monitoring wells MW-2 through MW-4 were unable to be developed. The monitoring well development form for monitoring well MW-1 is presented as **Appendix F**.

4.3 **Static Water-Level Measurements**. Prior to the groundwater sampling event on October 14, 2008, static water levels were obtained from the monitoring well network for determining the lateral groundwater flow direction. All water levels were measured using an electronic water-level indicator and were referenced to the surveyed monitoring well top of casing mark. Static groundwater elevations for each monitoring well are presented in **Table2**.

4.4 **Groundwater Sampling Program**. Groundwater samples were collected from the monitoring well network on October 14, 2008. The groundwater sample collected from each monitoring well were submitted under chain-of-custody document to a certified laboratory for chemical analysis of volatile organic compounds (VOCs) and dissolved lead. Duplicate groundwater samples were also collected from the monitoring well network and analyzed for in situ measurements (redox, dissolved oxygen, and pH).

4.5 **Surveying**. The elevations and locations of the monitoring wells, utilities, and significant site features including buildings and property lines were determined by a professional survey with a horizontal control accuracy of +/- 1.0 feet, and a vertical accuracy of +/- 0.01foot. Elevation data was referenced to a local USGS datum in feet above MSL. Monitoring well location data was referenced to the Wisconsin State Plane Coordinate System.

4.6 **Soil and Groundwater Waste Handling**. All decontamination water, monitoring well development water, and purge water generated during the investigation procedures was

containerized in 55-gallon Department of Transportation (DOT)–approved drums and temporarily staged on-site. The auger soil cuttings generated during drilling procedures were containerized in 55-gallon DOT-approved drums and temporarily staged on-site. On January 2, 2009 one 55-gallon drum of water and five 55-gallon drums of soil were transported off-site by Veolia Environmental Services for disposal at their Emerald Park Landfill. Disposal documentation is included as **Appendix G**.

5. INVESTIGATION RESULTS

Geology beneath the site was characterized during the drilling activities. The hydrogeology was determined from water-level measurements completed during field and data collection activities. Soil and groundwater quality beneath the site were evaluated based on the results of field screening measurements and analytical results of soil and groundwater samples. The following is a discussion of the site-specific physical and chemical characteristics of the soil and groundwater.

5.1 Site-Specific Subsurface Characteristics.

5.1.1 Site Geology. Soil at the site generally consists of silt and clay. Specifically stiff silty clay to clay was observed immediately beneath the asphalt surface to the maximum depth of drilling at each soil boring location, with the exception of soil boring B1, B2, and GP-1. The referenced soil borings were advanced within the identified former UST area and subsequently pea gravel was observed beneath the asphalt layer to a maximum depth of 6 feet bgs. The pea gravel was underlain by a sand layer ranging in thickness from two to six feet and was underlain by stiff clay to the maximum depth of drilling.

5.1.2 Site Hydrogeology. Static water levels were measured in the groundwater monitoring wells to determine the horizontal direction of shallow groundwater flow. To date, one round of static water level measurements was completed on October 14, 2008; depth to groundwater ranges from 5.23 bgs in monitoring well MW-1 and 14.93 feet bgs in monitoring well MW-4.

Please note, monitoring well MW-1 is located within the area identified as the former UST basin and subsequently pea gravel and sand was observed at monitoring well MW-1 from approximately one to 10 feet bgs. Based on the shallow water level observed at monitoring well MW-1, perched water resulting from the permeable sand and gravel zone may be present at monitoring well MW-1. In addition, review of the static water level measurements collected during the October 2008 sampling event and the observations made during the drilling activities indicates that groundwater within select monitoring wells does not appear to have fully recharged to static water levels. Therefore Sigma was unable to precisely determine groundwater flow direction representative of the subsurface conditions at the site. Groundwater elevations are presented on **Table 1**.

5.2 Soil and Groundwater Quality.

Field screening and laboratory data collected during the investigation were used to evaluate soil and groundwater conditions beneath the site and to determine the potential impacts to the environment resulting from the former UST system. The following is a discussion of the soil and groundwater laboratory results, and how the concentrations of petroleum hydrocarbon impacts detected in the soil and groundwater compare to applicable Chapter NR 720 Residual Contaminants Levels (RCLs) and Chapter NR 140 Groundwater Quality Standards.

5.2.1 Soil Quality. Based on analytical results GRO and select PVOCs were reported at concentrations greater than the respective state standards within soil samples collected from soil borings B1, GP-1, GP-3, and GP-5. Specifically GRO was reported at concentrations greater than the NR 720 RCL within the soil sample collected from soil borings B1 (6-8 feet bgs), GP-1 (8-10 feet bgs), GP-3 (2-4 feet bgs), and GP-5 (2-4 feet bgs). Benzene was reported at concentrations greater than the NR 720 RCL within the soil sample collected from soil borings B1 (6-8 feet bgs), GP-1 (8-10 feet bgs and 12-14 feet bgs), GP-3 (2-4 feet bgs and 10-12 feet bgs), and GP-5 (2-4 feet bgs and 8-10 feet bgs). In addition benzene was detected at concentrations greater than the Wisconsin Department of Commerce (COMM) 46 Table 2 Soil Screening Values (COMM 46 Table 2) within the shallow soil sample collected from soil boring GP-5 (2-4 feet bgs) and at concentrations greater than the COMM Table 1 Direct Contact Levels (COMM 46 Table 1) and COMM 46 Table 2 values within the shallow soil sample collected from soil boring GP-3 (2-4 feet bgs). Ethylbenzene, toluene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and xylene were reported at concentrations greater than the NR 720 RCL and/or COMM 46 Table 1 values within the shallow soil samples collected from soil boring GP-3 (2-4 feet bgs) and GP-5 (2-4 feet bgs). Xylene was also reported at concentrations greater than the Chapter NR 720 RCL within the soil sample collected from soil boring GP-5 (8-10 feet bgs). Total lead was reported at a concentration greater than the NR 720 non-industrial RCL of 50 milligrams per kilogram (mg/kg) within the soil sample collected from soil boring GP-8 (0-2 feet bgs). Soil quality results are presented on **Table 1B** and **Figure 3**. Soil laboratory results are included as **Appendix H**.

5.2.2 Groundwater Quality. Review of the groundwater quality results, indicates that benzene was reported at a concentration of 6.7 micrograms per liter (µg/l), slightly greater than the NR 140 Enforcement Standard (ES), within the groundwater grab sample collected from the temporary monitoring well TW-1.

Based on the identified NR 140 ES exceedance and in an effort to confirm the groundwater quality results and define the impact area, Sigma returned to the site on September 4, 2008 to install four NR 141 compliant monitoring wells (MW-1 through MW-4). Groundwater quality results indicate that contaminant concentrations were not detected above the Chapter NR 140 ES within any of the groundwater samples collected from the NR 141 compliant monitoring wells. However, select VOCs were reported at concentrations greater than the Chapter NR 140 Preventative Action Limit (PAL) within the groundwater samples collected from monitoring wells MW-1, MW-2, and MW-3. Specifically, benzene was reported at a concentration greater than the NR 140 PAL within the groundwater sample collected from monitoring well MW-1 and MW-2. 1,2-dichloroethane (1,2-DCE) was reported at a concentration greater than the NR 140 PAL within the groundwater sample collected from monitoring well MW-1 and MW-3 and naphthalene was reported at a concentration greater than the NR 140 PAL within the groundwater sample collected from monitoring well MW-1. In addition, chloromethane, a common laboratory contaminant, was detected at a concentration greater than the NR 140 PAL within the groundwater samples collected from monitoring well MW-1 and MW-2. Groundwater quality results are presented on **Table 3** and **Figure 4**. The groundwater analytical report is included in **Appendix I**.

5.3 **Contaminant Mass Calculation**. Due to the limited vertical and lateral extents of soil and groundwater impacts and the low concentrations reported in the groundwater, a total contaminant mass in the subsurface is considered negligible.

6. EVALUATION OF COMM 46.06/NR 746 RISK SCREENING CRITERIA

In accordance with Chapter COMM 46.06/NR 746, the following risk criteria (and how each applies to the site) shall be used to determine whether the site may be closed as provided in COMM 46.07:

(a) None of the following environmental factors are present at the site:

1. Documented expansion of plume margin. **(Based on the October 2008 groundwater monitoring event, groundwater samples collected at the site from Chapter NR 141 compliant monitoring wells do not appear to exceed the NR 140 enforcement standards. Benzene, 1,2-DCE, and naphthalene were detected at concentrations greater than the NR 140 preventative action limit within the groundwater samples collected from select monitoring wells however, contaminant concentrations appear to be confined to the source area (former UST area) and therefore the plume appears to be stable.)**

2. Verified contaminant concentration in a private or public potable well that attains or exceeds the preventive action limit. **(A review of the USGS private well construction reports indicates that approximately 45 private wells maybe located within 1200 feet of the site, however, due to the low-level groundwater concentration detected at the site contaminant migration to a private well is improbable.)**

3. Contamination within bedrock or within one meter of bedrock. **(Bedrock was not encountered during site investigation activities, however, based on a review of private well logs within the area of the site bedrock appears to be greater than 125 feet bgs.)**

4. Petroleum product that is not in dissolved phase is present with a thickness of 0.01 feet or more, and has been verified by more than one sampling event. **(Petroleum product was not encountered within any monitoring well at the site.)**

5. Documented contamination discharges to a surface water or wetland. **(The closest surface water body is the Milwaukee River located approximately 2,500 feet south/southwest of the site. Due to the low-level contaminant concentrations detected within the groundwater collected at the site, contaminant migration to a surface body is highly improbable.)**

(b) No soil contamination is present at the site that exceeds any of the soil screening levels in COMM 46.06 Table 1. **(Contaminant concentrations in excess of the COMM 46.06 Table 1 levels were not detected within each of the soil samples collected at the site with the exception of shallow soil samples collected from soil borings GP-3 and GP-5. Specifically, benzene, ethylbenzene, toluene, 1,3,5-trimethylbenzene, and xylene were reported at**

concentrations greater than the COMM 46.06 Table 1 soil screening levels within the shallow soil sample collected from GP-3 (2-4 feet bgs). In addition, ethylbenzene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and xylene were reported at concentrations greater than the COMM 46.06 Table 1 soil screening levels within the shallow soil sample collected from GP-5 (2-4 feet bgs). Therefore soil impacts in excess of the COMM 46.06 Table 1 soil screening levels appear to be confined to the shallow soil within the eastern portion of the site, presumably the area of the former dispenser.)

(c) There is no soil contamination with 4 feet of the ground surface that exceeds any of the direct contact soil contaminant concentrations for the substances listed in COMM 46.06 Table 2. **(Based on the soil quality data, contaminant concentrations greater than COMM 46.06 Table 2 levels were not reported within the soil samples collected at the site within 0 to 4 feet of the surface with the exception of benzene detected at a concentration of 2,420 micrograms per kilogram (µg/kg) within the shallow soil sample collected from soil boring GP-5 (2-4 feet bgs). Therefore soil impacts in excess of the COMM 46.06 Table 2 levels appear to be confined to the shallow soil within the vicinity of the former dispenser.)**

(d) For substances not listed in Table 2 that are present within 4 feet of the ground surface and have been approved by the agency with administrative authority for the site as contaminants of concern as defined in NR 720.03 (2), any potential human health risk from direct contact has been addressed. **(Lead was detected within the shallow soil sample collected from soil boring GP-8 (0-2 feet bgs) at a concentration of 87 milligrams per kilogram (mg/kg), slightly greater than the NR 720 non-industrial residual contaminant level (RCL). No other contaminants of concern, excluding substances listed in the COMM 46.06 Table 1 or Table 2 were reported within the shallow soil samples collected at the site.)**

(e) Except for the substances listed in Table 2, there is no human health risk from direct contact for a substance listed in Table 1 if the substance's concentration is below the Table 1 soil screening level. **(As referenced in screening criteria (b), select PVOC constituents were detected at concentrations greater than the Table 1 levels within the shallow soil samples collected from soil boring GP-3 and GP-5. Shallow soil impacts in excess of the COMM 46.06 Table 1 soil screening levels appear to be confined to the shallow soil within the vicinity of the former dispenser.)**

(f) If there are petroleum-products in soil or groundwater, the most recent release that caused or contributed to the contamination is more than 10 years old. **(The former gasoline service station building was razed in 1974. The associated gasoline USTs and associated dispenser were believed to also have been removed from the site at that time. Subsequently, the release that caused the contamination is likely more than 10 years old.)**

(d) There is no evidence of migration of petroleum product contamination within a utility corridor or within a permeable material or soil along which vapors, free product or contaminated water may flow. **(Groundwater is present at the site at an approximate depth of 13 feet bgs and appears to be minimally impacted. Therefore based on the average depth of shallow utilities above the groundwater at the site and the apparent lack of minimally impacted**

groundwater, utilities do not appear to be at risk of the migrations of petroleum product contamination).

(e) There is no evidence of migration or imminent migration of petroleum product contamination to building foundation drain tile, sumps or other points of entry into a basement or other enclosed structure where petroleum vapors could collect and create odors or an adverse impact on indoor air quality or where the contaminants may pose an explosion hazard. **(Minimal groundwater impacts appear to be present at the site and therefore migration to a basement structure is highly unlikely).**

(f) No enforcement standard is attained or exceeded in any groundwater within 1000 feet of a well operated by a public utility, as defined in s. 196.01 (5), Stats., or within 100 feet of any other well used to provide water for human health consumption. **(See (a) 2 above).**

All Comm 46.06/ NR 746.06 risk criteria have been evaluated and satisfied for this site. Consequently, minimal risk to human health or the environment is present with respect to the petroleum hydrocarbon release at the ANR Capital property located at 7001 North Port Washington Road, Glendale, Wisconsin.

7. SUMMARY

The following is a summary of the geologic, hydrogeologic, and analytical data obtained from the ANR Capital property located at 7001 North Port Washington Road, Glendale, Wisconsin.

- In May 2008, Sigma advanced eight Geoprobe soil borings GP-1 through GP-8 at the site. Two soil samples were collected from each soil boring for laboratory analysis of GRO, PVOC, and lead. Benzene, ethylbenzene, toluene, 1,2,4-trimethylbenzene, 1,3,5-Trimethylbenzene, and/or xylene were detected at concentrations greater than the NR 720 RCL, COMM 46 Table 1 and/or Table 2 values within the shallow soil collected from soil boring GP-3 (2-4 feet bgs) and GP-5 (2-4 feet bgs). In addition, benzene and/or ethylbenzene was reported at concentrations greater than the NR 720 RCL within the soil samples collected at depth from soil borings GP-1 (8-10 and 12-14 feet bgs), GP-3 (10-12 feet bgs), and GP-5 (8-10 feet bgs). Lead was also detected at a concentration greater than the non-industrial NR 720 RCL within the shallow soil sample collected from soil boring (GP-8 0-2 feet bgs).

- Temporary groundwater monitoring well TW-1 was also installed during the Geoprobe assessment activities conducted in May 2008. Laboratory results from the groundwater grab sample collected from temporary well TW-1 reported benzene to be present at a concentration of 6.7 µg/l, slightly greater than the NR 140 ES.

- On August 4, 2008, Sigma advanced one additional Geoprobe soil borings and installed four groundwater monitoring wells. Two soil samples were collected from select soil borings (MW-4/GP-9 and GP-10) for laboratory analysis of PVOC and lead. PVOCs were not reported at concentrations greater than the laboratory detection limits and lead was reported a concentrations less than the non-industrial NR 720 RCL within each of the soil samples analyzed.

- Soil at the site generally consists of tight silt and clay with the exception of pea gravel and sand which was observed within the soil borings advanced immediately south of the former service station building (B1, B2, and GP-1). Based on the observed pea gravel and lack of drilling refusal, it was determined that the gasoline USTs associated with the former service station were historically present within the vicinity of Geoprobe borings B1 and B2 and were likely removed during the demolition of the former service station building in 1974.

- Depth to groundwater ranges from 5.23 feet bgs in monitoring well MW-1 and 14.93 feet bgs in monitoring well MW-4. Based on the shallow water level observed at monitoring well MW-1, perched water resulting from the permeable sand and gravel zone may be present at monitoring well MW-1. In addition, review of the static water level measurements collected in October 2008 and the observations made during the drilling activities indicates that groundwater within select monitoring wells does not appear to have recharged to static water levels. Therefore Sigma was unable to precisely determine the groundwater flow representative of subsurface conditions at the site.

- During the October 2008 groundwater sampling event, lead was not detected at a concentration greater than the laboratory detection limits within the groundwater sample collected from each groundwater monitoring wells. In addition, VOCs were not detected at concentrations greater than the NR 140 ES within the groundwater sample collected from each groundwater monitoring well; however, select VOCs included benzene, chloromethane, 1,2-DCA, and/or naphthalene were reported at concentrations slightly greater than the NR 140 PAL within the groundwater sample collected from monitoring wells MW-1,MW-2, and MW-3.

8. CONCLUSIONS

Based on soil analytical results petroleum hydrocarbon impacts were detected at concentrations greater than the NR 720 RCLs and/or COMM 46 Table 1 or 2 screening levels within select soil samples collected from the site. Soil impacts at the site appear to be limited in extent and are generally present immediately south/southeast of the former service station (east of current building) within the perceived former UST and dispensing system area. In addition, groundwater samples collected from the NR 141 compliant monitoring wells indicate that VOCs and lead were not detected at concentrations greater than the NR 140 ES.

Contaminant concentrations within the soil and groundwater resulting from the former operation of a gasoline service station at the site appear to be minimal in extent and therefore do not appear to warrant further investigation. Subsequently, Sigma on behalf of ANR Capital requests the Wisconsin Department of Commerce grant case closure at the site contingent on filing a soil and groundwater Geographic Information Systems (GIS) registry due to the residual soil and groundwater impacts remaining at the site at concentrations greater than state standards.

9. LIMITATIONS OF INVESTIGATION

This report was prepared under constraints of cost, time and scope, and reflects a limited assessment and evaluation rather than a full, total, complete or extensive assessment and evaluation. Our assessment was performed using the degree of care

and skill ordinarily exercised, under similar circumstances, by professional consultants practicing in this or similar localities. No other warranty or guarantee, expressed or implied, is made as to the conclusions and professional advice included in this report.

The findings of this report are valid as of the present date of the assessment. However, changes in the conditions of a property can occur with the passage of time, whether due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation, from the broadening of knowledge, or from other reasons. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control.

The interpretations and conclusions contained in this report are based upon the result of independent laboratory tests and analysis intended to detect the presence and/or concentrations of certain chemical constituents in samples taken from the subject property. Sigma has no control over such testing and analysis and therefore, disclaims any responsibility for any errors and omissions arising therefrom.

A subsurface exploration was performed and presented in this report. However, subsurface exploration cannot totally reveal what is below the surface. Depending upon the sampling method and frequency, every soil condition may not be observed, and some materials or layers, which are present in the subsurface, may not be noted.

This report is issued with the understanding that it is the responsibility of the owner(s) to ensure that the information and recommendations contained herein are brought to the attention of the appropriate regulatory agency(ies).

This document contains proprietary and confidential information which is the sole and exclusive property of Sigma Environmental Services, Inc. and ANR Capital. This document may not be used or duplicated in any manner without the express written consent of Sigma Environmental Services, Inc. and ANR Capital.

AMOCO STATION #2290 [SITE #11]

WisDOT Phase 1 Hazardous Materials Assessment Site Summary

(rev. 8/01/2020)

WisDOT Project ID: 2967-00-07, MCDOT ID: WH118011
Highway/Street: W. Good Hope Road (CTH PP)
Termini/Limits: 51st St -Range Line Rd./N. Sherman Blvd./W. Green Tree Road
County: Milwaukee County

Property Information:
Site Name(s):Amoco Station #2290 [Site #11]
DOT parcel number (if known):
Property Address: 7010 N. Port Washington Road
Owner's Name: 7010 GLENDALE, L.L.C.
Owner's Address:
Owner's Phone:
Current Land Mobile – Port Road Mart
Past Land Use:Service Station

Real Estate Requirements:
☒None ☐Total take ☐Strip acquisition of feet
☐Temporary Limited Easement (TLE)
☐Permanent Limited Easement (PLE)
☐ Other (describe)

Construction Requirements:
☒ Excavation within current right of way to 14 feet
☐ Excavation within proposed right of way to feet
☐ Excavation within easement to feet
☐ Public or private utility or sanitary or storm sewer installation or excavation to feet

Information from database searches and interviews:
Department of Safety and Professional Services (DSPS)
- ☒ site has registered tanks ☐ASTs ☒USTs
- ☐ tanks are currently in use
- ☒ tanks are abandoned date:1987, 2005
- Tank contents:
  - ☒ Leaded gasoline ☒ Unleaded gasoline ☒ Fuel Oil ☐ Diesel
  - ☐ Kerosene ☐ Unknown ☒ Other (Waste/Used motor oil)
- ☐ site is a DSPS administered LUST site; DCOMM ID number:
- ☐ site is a closed DSPS LUST site; closure date:

Department of Natural Resources (DNR)
- ☒ site is a DNR administered LUST site; BRRTS number: 03-41-003527
- ☐ site is a DNR administered ERP site; BRRTS number:
- ☒ site is a closed ☒LUST ☐ERP site; closure date: Aug. 2005
- ☐ site is a landfill
- ☐ site is an abandoned waste disposal site
- ☐ site is a hazardous waste generator
- ☐ Other (please describe)

Sanborn Maps: site is on mapsdated . Comments:
WisDOT historic plan sets: site is a on project dated . Comments:
Business directories: site is in the directory dated Comments:

A check in a checkbox indicates a positive or "yes" response.

Aerial photos: Site has been occupied by the same commercial building since the 1990.
☐ Contamination discovered at feet during utility or other excavation in the area. Indicate location on site map.
Interview Information or other comments: an auto services and gas station since 1965

Visual Evidence of Potential Contamination: (include additional information in space provided)
☐ No evidence of tanks
☒ USTs ☐ASTs Location, number and condition of tanks, contents, comments: Two 10,000-gallon and one 20,000-gallon unleaded gasoline USTs
Location in relationship to current right of way: within 10' to 20' ☒ map attached
Location in relationship to proposed right of way: ☐ map attached
☐Drums ☐Stained soils ☐Odor ☐Sheen on surface water ☐Areas of excavation
☐ Areas of fill ☐Stressed vegetation ☐ Pond(s) ☐ Basins/sumps ☐ Monitoring wells
☐ Soil borings
Comments:

Potential for Contaminant Migration: (attach supporting documentation such as plume maps, summaries of site investigation or closure reports).
☒ Property is a potential source of contamination
☐ Adjacent property is a potential source of contamination. Include site name or BRRTS number if known, describe location, include contaminant type and any additional information.
☐ Contaminated soil known to be within proposed right of way from tofeet below ground surface
☐ Contaminated groundwater known to be within proposed right of way at tofeet below ground surface.
☐ Contaminated soil or groundwater within existing right of way. Attach copy of most recent investigation and plume maps.

Attachments – required
☒ Site photographs and a site map showing areas of concern
☐ Plat map showing parcel and any proposed areas of acquisition or easement
☐ Historic aerial photos of site - clearly outline site
☐ Historic WisDOT or other as-builts and plat maps - clearly outline site
☐ Plume maps for known contamination. Indicate existing or proposed right of way where applicable.

Recommendations
☐ No additional hazardous materials investigation is required.
☐ If construction or real estate requirements change, evaluation of need for further investigation will be necessary.
☐ Information is sufficient to use Standard Special Provisions. Copy of completed Standard Special Provision is attached.
☒ Conduct additional investigation
- ☐ Phase 2 (determine if contamination is present)
- ☒ Phase 2.5 (determine extent of contamination within existing R/W only)
- ☐ Phase 3 (determine full extent of contamination prior to acquisition)
- ☐ Phase 4 (remediate site)
- ☐ Other (describe)

A check in a checkbox indicates a positive or "yes" response

Site #11
Former Amoco Station #2290
7010 N. Port Washington Road
N. Port Washington Rd: STA 13+25 to 14+55 RT

The site is identified on the UST, LUST (BRRTS #03-41-003527), EDR Historical Auto, SHWIMS, RCRA-VSQG, SPILLS, CRS, AUL, WI WRRSERdatabases. Based on field reconnaissance, the site is currently by a Mobile gas station. Review of the Milwaukee County Automated Mapping and Land Information System online indicated that the site is owned by 7010 Glendale, LLC.[Ref. 1].

According to the WDATCP Storage Tank Database,seven tanks are registered to the site [Ref.2]. In May 1987, one 10,000-gallon unleaded gasoline UST, one 10,000-gallon leaded gasoline UST, and one 550-gallon waste / used motor oil UST was closed / removed. One 1,000-gallon fuel oil UST is registered to the site as 'admin closure' as of September 2005. Two 10,000-gallon and one 20,000-gallon unleaded gasoline UST are registered to the site as 'In Use'. The occupancy for all tanks is listed as 'retail fuel sales'.

According to the EDR report, no Sanborn Map coverage is available for the project corridor. EDR Historical Auto database indicates that auto services and petroleum UST systems have been utilized on-site since 1965.

Himalayan's review of historical aerial photographs indicates the site woodland with a building until the 1960s. By 1963, the woodland and building was razed and was replaced with a commercial building and parking lot in the northeast corner of W. Green Tree Road and N. Port Washington Road. The commercial building was razed and redeveloped with a new commercial building in 1990. The site has remained the same for 30 years.

The SHWIMS database lists the site as an inactive, small quantity Hazardous Waste Generator of non-listed ignitable wastes. The wastes were most likely associated with the clean-up and removal of former UST systems at the site [Ref.3].

BRRTS #03-41-003527: In August 1993, the site owner received a notification of hazardous substances discharged. Based on the report by Delta Environmental Consultants, Inc. (Delta), between November 1993 to March 1994 seven monitoring wells (MW-1 to MW-7) were installed on the site. Nine additional soil borings (SB-1 to SB-3, GP-1 to GP-6) with a maximum depth of 20 feet bgs were then advanced between April 1999 and September 2002 [Ref.3]. Soil and groundwater were analyzed for DRO, GRO, PVOCs, PCBs, and lead. Only sample GP-4 was analyzed for PAHs [Ref.4].

Based on Delta's investigation, contaminated soil exceeding NR 720 RCLs and contaminated groundwater exceeding NR 140 ES remains on the site. According to Delta, soil and groundwater plumes appear to be stable and will naturally degrade over time, therefore, the

site has met all risk criteria in accordance with Chapter NR 726/NR 746. In August 2005, the activity was conditionally closed by the Wisconsin Department of Commerce with land use limitations to address direct contact risk and a cap maintenance plan [Ref.4].

Geology / Hydrogeology.

Based on a site investigation across the street, soils at the site most likely consist of silt and clay from the ground surface to 16 feet bgs and groundwater depth ranges from 5 to 8 feet bgs. According to the report by Delta, groundwater generally flows southwest toward W. Green Tree Road and N. Port Washington Road right of way [Ref.4].

Based on the USDA NRCS soil survey report, soils along the site consist of Clayey land (Cv). Clayey land is generally described as areas where development activities have either covered over or removed the original solum of the soil, therefore, native soil conditions are no longer present within the project corridor. This soil type is described as moderately well drained and the depth to groundwater is generally about 12 to 80 inches bgs[Ref.5]

Soil Impacts

According to Deltas report, soil boring GP-2, GP-3 and GP-4 had DRO (7.6 to 275 mg/kg), GRO (54 to 456 mg/kg), ethylbenzene (319 to 11,100 µg/kg), and xylene (1,210 to 6,290 µg/kg) exceeding their respective NR 720 RCLs. Soil boring GP-2 also exceeded its NR 720 RCLs for benzene (1,540 µg/kg) and toluene (2,750 µg/kg) [Ref.4].

It appears that residual soil contamination (GP-2 at 2-6 feet bgs) exceeds NR 720 RCLs and is approximately 50 feet from the W. Green Tree Road and N. Port Washington Avenue right of ways.

Groundwater Impacts

Based on the groundwater sampling in May 2000, the last samples for MW-1 through MW-4 still had MTBE (14 to 100 µg/L) exceeding their respective NR 140 PAL and ES. MW-1 and MW-2 also had benzene (0.64 to 2.7µg/L) exceeding its NR 140 PAL [Ref.4].

Based on the most recent groundwater sampling event in September 2002, groundwater sample GP-4 had total TMBs (212 µg/L), methylene chloride (4.2 µg/L), and naphthalene (33 µg/L) exceeding its NR 140 PAL. GP-4 also exceeded NR 140 PAL and ES for several PAHs. Groundwater sample G-2 had benzene (1.8 µg/L) and groundwater sample GP-6 had MTBE (14 µg/L) exceeding their respective NR 140 PAL [Ref.4]

It appears that the groundwater contaminant plume (GP-2) is approximately 50 feet from W. Green Tree Road and N. Port Washington Road right of ways.

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE are anticipated at the site.

Recommendations

Considering that the impacted soil and groundwater contaminant plume are within 50 feet of the project corridor intersection and that groundwater flows southwest towards W. Green Tree Road and N. Port Washington Road, this site has the potential to impact the proposed improvements. Therefore, further investigation is recommended for the site.

The need for further investigation could be re-evaluated once construction and/or real estate requirements have been determined.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

FORMER WILSON & ALLEN PROPERTY [SITE #12]

WisDOT Phase 1 Hazardous Materials Assessment Site Summary

(rev. 8/01/2020)

WisDOT Project ID: 2967-00-07, MCDOT ID: WH118011
Highway/Street: W. Good Hope Road (CTH PP)
Termini/Limits: 51st St -Range Line Rd./N. Sherman Blvd./W. Green Tree Road
County: Milwaukee County

Property Information:
Site Name(s):Former Wilson & Allen Property[Site #12]
DOT parcel number (if known):
Property Address: 6980 N. Port Washington Road
Owner's Name: ADELMAN PROPERTIES L L C
Owner's Address:
Owner's Phone:
Current Land: Adelman Travel / Aurora Health Center
Past Land Use:Gasoline / Self Service Station

Real Estate Requirements:
☒None ☐Total take ☐Strip acquisition of feet
☐Temporary Limited Easement (TLE)
☐Permanent Limited Easement (PLE)
☐ Other (describe)

Construction Requirements:
☒ Excavation within current right of way to 14 feet
☐ Excavation within proposed right of way to feet
☐ Excavation within easement to feet
☐ Public or private utility or sanitary or storm sewer installation or excavation to feet

Information from database searches and interviews:
Department of Safety and Professional Services (DSPS)
- ☒ site has registered tanks ☐ASTs ☒USTs
- ☐ tanks are currently in use
- ☒ tanks are abandoned date: 1992, 1993
- Tank contents:
  - ☒ Leaded gasoline ☒ Unleaded gasoline ☒ Fuel Oil ☐ Diesel
  - ☐ Kerosene ☐ Unknown ☒ Other (Waste/Used motor oil)
- ☐ site is a DSPS administered LUST site; DCOMM ID number:
- ☐ site is a closed DSPS LUST site; closure date:

Department of Natural Resources (DNR)
- ☒ site is a DNR administered LUST site; BRRTS number: 03-41-002679
- ☐ site is a DNR administered ERP site; BRRTS number:
- ☒ site is a closed ☒LUST ☐ERP site; closure date: May 1994
- ☐ site is a landfill
- ☐ site is an abandoned waste disposal site
- ☒ site is a hazardous waste generator
- ☐ Other (please describe)

WisDOT historic plan sets: site is a on project dated . Comments:
Business directories: site is in the directory dated Comments:

A check in a checkbox indicates a positive or "yes" response.

Aerial photos: Site has been occupied by the same commercial building since the 1995.
☐ Contamination discovered at feet during utility or other excavation in the area. Indicate location on site map.
Interview Information or other comments: utilized as an automobile service station and machine shop for over 50 years.

Visual Evidence of Potential Contamination: (include additional information in space provided)
☒ No evidence of tanks
☐ USTs ☐ASTs Location, number and condition of tanks, contents, comments:
Location in relationship to current right of way: ☐ map attached
Location in relationship to proposed right of way: ☐ map attached
☐Drums ☐Stained soils ☐Odor ☐Sheen on surface water ☐Areas of excavation
☐ Areas of fill ☐Stressed vegetation ☐ Pond(s) ☐ Basins/sumps ☐ Monitoring wells
☐ Soil borings
Comments:

Potential for Contaminant Migration: (attach supporting documentation such as plume maps, summaries of site investigation or closure reports).
☒ Property is a potential source of contamination
☐ Adjacent property is a potential source of contamination. Include site name or BRRTS number if known, describe location, include contaminant type and any additional information.
☐ Contaminated soil known to be within proposed right of way from to feet below ground surface
☐ Contaminated groundwater known to be within proposed right of way at tofeet below ground surface.
☒ Contaminated soil or groundwater within existing right of way. Attach copy of most recent investigation and plume maps.

Attachments – required
☒ Site photographs and a site map showing areas of concern
☐ Plat map showing parcel and any proposed areas of acquisition or easement
☐ Historic aerial photos of site - clearly outline site
☐ Historic WisDOT or other as-builts and plat maps - clearly outline site
☐ Plume maps for known contamination. Indicate existing or proposed right of way where applicable.

Recommendations
☐ No additional hazardous materials investigation is required.
☐ If construction or real estate requirements change, evaluation of need for further investigation will be necessary.
☐ Information is sufficient to use Standard Special Provisions. Copy of completed Standard Special Provision is attached.
☒ Conduct additional investigation
- ☐ Phase 2 (determine if contamination is present)
- ☒ Phase 2.5 (determine extent of contamination within existing R/W only)
- ☐ Phase 3 (determine full extent of contamination prior to acquisition)
- ☐ Phase 4 (remediate site)
- ☐ Other (describe)

A check in a checkbox indicates a positive or "yes" response

Site #12
Former Wilson & Allen Property
6980 N Port Washington Road
N. Port Washington Rd: STA 09+95 to 12+45 RT

The site is identified on the UST, LUST (BRRTS #03-41-002679), SHWIMS, RCRA-VSQG, FINDS databases. Based on field reconnaissance, the site is currently occupied by Adelman Travel / Aurora Health Center. Review of the Milwaukee County Automated Mapping and Land Information System online indicated that the site is owned by Adelman Properties, LLC. [Ref. 1].

According to the WDATCP Storage Tank Database, eight tanks are registered to the site [Ref.2]. One 250-gallon leaded gasoline UST, two 550-gallon and one 1,300-gallon unleaded gasoline USTs, one 1,000-gallon fuel oil UST, one 300-gallon and one 500-gallon waste / used motor oil UST and one 550-gallon UST with unknown content are registered to the site. All tanks were closed between September 1992 and February 1993 and were used for 'retail fuel sales'.

According to the EDR report, no Sanborn Map coverage is available for the project corridor.

Himalayan's review of historical aerial photographs indicates the site has been occupied by a commercial building since the 1930s. By 1995, the building was razed and a commercial building and parking lot was redeveloped in 2000. The site has remained the same for over 20 years.

The SHWIMS database lists the site as an inactive, high quantity Hazardous Waste Generator and an active, small quantity Hazardous Waste Generator of non-listed toxic wastes. The small quantity wastes are most likely associated with various medical wastes [Ref.3].

BRRTS #03-41-002679: In September 1992, the site owner received a notification of hazardous substances discharged. Based on the report by Key Environmental Services, Inc. (Key), the site was developed in the 1920's and was mainly utilized as an automobile service station and machine shop. Key advanced five borings (B-1 to B-5) at the site with a maximum depth of 15 feet bgs. All soil samples were analyzed for DRO and GRO and only soil borings B-2 and B-5 were analyzed for PVOCs. No groundwater was encountered in boring holes during the site investigation [Ref.4].

Based on Key's investigation, from January 1993 through February 1993, 2,140 tons of impacted soil was excavated from the site and 70 final confirmation samples (SW-1 to SW-65, SB-1 to SB-5) were collected from the base and sidewalls of the excavations at depths ranging from 3 to 10 feet bgs. Only 23 of 70 the final confirmation samples were analyzed for PVOCs, GRO, DRO, and lead. According to Key, no groundwater was encountered and only one final confirmation sample had exceeded NR 720 RCLs along the west side of the site.

Due to conflicts with underground utilities, excavation of impacted soil was discontinued along the west and north property boundaries. No excavation was permitted within 13 feet of W. Green Tree Road and N. Port Washington Road. Key concluded that approximately 250 cubic yards of contaminated soil remains off-site to the west and north. The LUST site was closed by the WDNR in May 1994 [Ref. 4].

Geology / Hydrogeology.

According to the report by Key, soils at the site mainly consisted of dense clay underlain by silty clay to depths up to 8 to 15 feet bgs. Although no groundwater was encountered during the site investigation, the estimated depth of groundwater was expected to be 18 to 20 feet bgs and flow south to southeast [Ref.4].

Based on the USDA NRCS soil survey report, soils along the site consist of Clayey land (Cv). Clayey land is generally described as areas where development activities have either covered over or removed the original solum of the soil, therefore, native soil conditions are no longer present within the project corridor. This soil type is described as moderately well drained and the depth to groundwater is generally about 12 to 80 inches bgs [Ref.5]

Soil Impacts

According to the report by Key, confirmation soil samples SW-26, SW-38, SW-46 had several low detects of PVOCs below their NR 720 RCLs. Only soil sample SB-46 at 6 feet bgs, had a benzene concentration (35.5 ug/kg) exceeding its NR 720 RCL. SW-38 at 6 feet also had a GRO concentration (530 mg/kg) exceeding NR 720 RCL [Ref.4]. Residual soil impacts along the north and west sides of the site and the presence of underground utilities within the W. Green Tree Road and N. Port Washington Road right of ways may have also acted as a conduit for further contaminant migration.

It appears that the closest residual soil contamination (SW-38) is within the current W. Green Tree Road and N. Port Washington Road right of ways and possibly extends underneath the roadway.

Groundwater Impacts

Based on the report by Key, no groundwater was encountered [Ref.4].

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site.

Recommendations

Considering the sites historical use (automobile service station and machine shop for over 50 years) and residual soil contamination detected at 6 feet bgs within the current W. Green Tree Road and N. Port Washington Road right of ways, this site has the potential to impact some proposed improvements. Therefore, further investigation is recommended for the site.

The need for further investigation could be re-evaluated once construction and/or real estate requirements have been determined.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

Dear Ms. Wilson and Ms. Allen:

RE: Petroleum contamination at 6980 North Port Washington Road

I have considered your case for closure based on the following documents submitted by Key Environmental, Inc:

1. "Soil Remediation/Site Closure" report, dated 6/18/93

2. letter dated 12/15/93

I agree with Key Environmental Services, Inc., that no further work is needed regarding the former tank systems. I am sending a signed Form 4 to the Department of Industry, Labor, and Human Relations.

Sincerely,

John Feeney

Section 101.143 (3) (c) 4, Wis. Stats., requires that a claimant obtain written approval from the Department of Natural Resources (DNR) when requesting reimbursement for activities in response to a discharge from a commercial petroleum product storage system or home oil tank. The DNR approval must indicate that the site investigation and remedial action plan is adequate to meet requirements of s. 144.76, Wis. Stats. The DNR approval is created for the purpose of meeting the requirements of s. 101.143 (3), Wis. Stats., only and does not bar the DNR from requiring that additional investigation and/or remediation activities be performed by persons responsible under s. 144.76, Wis. Stats.

DNR Use Only

Any DNR / DOJ Enforcement Action(s) or DNR LUST Trust Expenditures on this site? ☐ Yes ☒ No

If answer is yes, please provide pertinent details on attached sheet.

Claimant's Name	Remedial Action Site Name (if business)
Mrs. Alice Wilson & Mrs Marilyn Allen	Wilson/Allen Property
Street Address	**Remedial Action Site Address**
230 West Fox Dale Road	6980 North Port Washington Road
City, State, Zip Code	**City, State, Zip Code**

Glendale, Wisconsin
FID 241-56913-0

KEY ENVIRONMENTAL SERVICES, INC.
File No. 0207006

Dear Mr. Feeney:

Key Environmental Services, Inc., has reviewed your letter dated September 22, 1993 regarding closure at the above referenced site. Following our phone conversation on September 28, 1993 regarding item 4, Key Environmental Services, Inc., completed the additional requirements for obtaining site closure.

1) Copies of the State of Wisconsin Hazardous Waste manifests for the disposal of the two drums of sludge generated from the cleaning of the waste oil Underground Storage Tanks (USTs) and the waste hydraulic oil from the ram are attached. Also included is a copy of the manifest for the five drums of sludge generated from the first six UST systems removed from the site.

2) Enclosed is the itemized billing from Parkview Landfill for disposal of the contaminated soil.

3) On November 2, 1993 four soil borings were advanced using a truck mounted drilling rig. The borings were advanced to the native soils at the base of each former waste oil UST excavation. A split spoon sample was then collected from each boring. The soil samples were submitted to a certified laboratory for analysis of PCBs and cd, as requested. Two (2) of the samples were also submitted for analysis of VOCs. There were no detectable concentrations indicated for any of the parameters analyzed. Enclosed are copies of the laboratory results and the chain of custody. A diagram

illustrating the boring locations along with the boring logs and borehole abandonment forms are also attached.

4) As discussed, significant complications inhibited conducting additional remediation or subsurface exploration to the north, west and northwest. Port Washington Road exists to the immediate west and Greentree Road to the immediate north. Mr. Richard Keyes with the Milwaukee County Department of Public Works attended the site and indicated that the County of Milwaukee owned thirteen (13) feet of right of way along Port Washington Road. He stated that the remediation could not extend into the right of way property. Within a 10-foot area between the curb (Port Washington Road) and the extent of the excavation to the west, a 20-inch high pressure gas main and the City of Glendale water main exists. In addition, traffic lights exist to the immediate northwest (SW-38). Based on the conditions presented, any further work could result in significant consequences and is therefore, impractical to conduct.

Greentree Road, the City of Glendale right of way property, and a 6-inch natural gas line exists to the immediate north of the final excavation. Again, it was not practical to conduct additional work in this area.

The soil sample which registered a GRO concentration of 500 ppm was collected from the former dispensing island and dispensing line locations and not from the UST cavities. Therefore, based on the subsurface conditions, the volume of impacted soil remaining within the right of way and gas main areas is expected to be minimal. The remaining soil impacts predominantly exist outside of the subject site.

It is, therefore, requested that a no further action letter be issued by the WDNR and PECFA Form 4 be signed indicating final site closure in order to obtain reimbursement for the remedial action costs at the site.

If you should have any further questions, please feel free to contact us. Thank you for your continued cooperation on this project. Upon your approval, please forward a copy of the signed Form 4 for our files.

Sincerely,

Milwaukee, WI 53217

Dear Ms. Wilson and Ms. Allen:

RE: PECFA Form 4 for 6980 North Port Washington Road, Glendale, FID 241-56913-0

I have reviewed your case for the purpose of signing the PECFA Form 4 that was submitted to me and to consider the case for closure. I have the following requirements before I can sign the Form 4 or consider the case for closure:

1. Submit sludge disposal documentation including sludge from the hydraulic ram and the waste oil tanks.

2. Submit soil disposal documentation such as a manifest from the landfill.

3. The areas near the waste oil tanks should have been sampled for VOC's, PCB's and Cd following WDNR requirements. Please direct your consultant to re-sample in those areas in native soil for those parameters.

4. The extent of soil contamination must be determined beyond the northwest corner of the excavation where the gasoline range organic contamination level was quite high (500 ppm). Soil sampling in a soil boring must follow WDNR guidelines that call for two laboratory soil samples per boring over 10 feet deep. One sample must be taken at the highest field screen reading and the other taken at the bottom of the borehole.

Sincerely,

John Feeney

1.0 EXECUTIVE SUMMARY

Eight (8) underground storage tank (UST) systems were removed from the Wilson/Allen property, located at 6980 North Port Washington Road in Glendale, Wisconsin. The USTs stored gasoline, waste oil and diesel fuel and ranged in size from 250 to 1,300 gallons. Seven (7) of the USTs were removed by North Shore Excavating, Inc., on September 1, 2, and 3, 1992. The eighth (8) UST was found and removed during remediation activities on February 5, 1993. Three (3) other tanks were previously removed in 1982. Site assessments conducted during the UST removals, indicated that soil contamination (petroleum odors and soil staining) was present within the subsequent cavities. Field screening with a Photo-ionization detector indicated readings as high as 700. Laboratory analysis indicated soil contamination from gasoline, diesel and waste oil. Four (4) of the USTs were within a common cavity.

A Remedial Investigation (RI) was conducted on November 30, 1992 and consisted of five (5) soil borings to depths of ten (10) to fifteen (15) feet. Soil samples were collected for field screening, soil classification and laboratory analysis. The results indicated that the extent of the impacts were apparently determined.

The soils encountered on-site generally consisted of dense clays with occasional silty sand layers. The clays exhibited hard consistencies and therefore would be expected to inhibit significant migration of contaminants. No groundwater was encountered during the UST removals or remedial investigation.

Soil remediation consisted of excavation with landfilling. North Shore Excavating, Inc., excavated 2,140 tons (about 1,530 cubic yards) of contaminated soil and transported the materials to Parkview Recycling and Disposal Facility for disposal. Soil remediation was conducted from January 11, 1993 through January 18, 1993, and completed on February 5, 1993. Groundwater was not encountered during the remediation activities.

Soil samples collected from the final excavation and submitted for analysis indicated that an effective soil remediation program was conducted. In addition, soil samples collected and analyzed from the impacted soils showed that they were above DNR guidelines and therefore, considered contaminated.

A groundwater monitoring program was not implemented, since groundwater was not encountered and is anticipated to exist at a depth of 18 to 20 feet. Soil impacts extended to a maximum depth of 10 feet.

Analytical testing and field screening conducted during this project, concluded that an effective soil remediation program was accomplished. It is therefore recommended that no further remediation be conducted at this site.

Please refer to the attached report for a complete description of the project and a discussion of the results.

2.0 INTRODUCTION

2.1 Project Description

On September 1, 2, and 3, 1992: one (1) 1,300 gallon UST, one (1) 1,000 gallon UST, three (3) 550 gallon USTs, one (1) 500 gallon UST and one (1) 250 gallon UST, associated dispensing lines, and two (2) common dispensing islands were removed from the Wilson/Allen site located at 6980 North Port Washington Road in Glendale, Wisconsin. Soil contamination (indicated by stained soils, petroleum odors and significant PID readings) were encountered in the three (3) subsequent cavities and beneath both dispensing islands. An exploration was conducted, following the UST removals in an effort to determine the extent of the impacts. Soil borings were extended at various locations around each former tank cavity. Soil samples were collected at 2.5 foot intervals from the soil borings and field screened. Selected samples were then submitted for laboratory analysis. The laboratory and field results had indicated that the extent of the impacts were apparently defined. However, since the initial contaminant levels were above the Wisconsin Department of Natural Resources (WDNR) guidelines, soil remediation was necessary. Soil remediation consisted of excavation with landfilling. This report describes the environmental and remediation services conducted at the Wilson/Allen site.

2.2 Scope of Services

Key Environmental Services, Inc., was contracted to conduct the site assessment, and to monitor the Remedial Investigation (RI) and Soil Remediation activities at the site. The following services were provided by Key Environmental Services, Inc., during this project.

- Monitoring the removal of the UST systems.
- Monitoring the remedial exploration activities following the UST system removals.
- Collecting soil samples @ 2.5 foot intervals from the five (5) soil borings.
- Obtaining landfill approval for disposal of the impacted soils.
- Monitoring the soil remediation activities.
- Collecting soil samples from the final excavation and from the contaminated soils transported for disposal.
- Submitting representative soil samples to a certified laboratory for analysis.
- Reviewing the results of the field and laboratory data and developing conclusions and recommendations for the completed project.

3.0 SETTING

3.1 Site Description

The property address is 6980 North Port Washington Road in Glendale, Wisconsin. The site is located in the Southwest 1/4 of the Northeast 1/4 of Section 20, Township 8 North, Range 22 East. The location of the site is illustrated on Figure 1 in Appendix 1.

The property was occupied with a concrete block and steel frame structure. The remainder of the site contained asphalt driveways with some areas of vegetation growth. A potable well did exist on the site and was properly abandoned during the building demolition. The site is serviced by municipal sewer and water. A water sample from the potable well was collected by Key Environmental Service, Inc., and tested by a WDNR certified laboratory for Coliform and E. Coli. The test results indicated that the well was positive for total Coliform and negative for E. Coli and was therefore considered unsafe for human consumption at that time. The well was abandoned by others and the structure was razed following condemnation by the City of Glendale. The subject property is currently vacant.

Four (4) of the USTs were situated about thirty-five (35) feet east of Port Washington Road and in a common cavity located under the concrete slab inside the former building. The four (4) USTs were approximately three (3) feet below the surface within a common cavity and lying in a diagonal direction. A common dispensing island was associated with the four (4) USTs and was located approximately twenty (20) feet to the west. A second island was located approximately sixty (60) feet to the north and serviced two (2) former USTs that were removed by others in 1982. The two (2) islands were also serviced by common dispensing lines linked between the islands. The USTs stored gasoline and diesel fuel.

A 500 gallon waste oil UST was situated about fifteen (15) feet to the northeast of the previous four (4) tanks. The waste oil UST was also approximately three (3) feet below the concrete floor located inside the building. A 1,300 gallon gasoline UST was located about eight (8) feet south of Green Tree Road at the northeast corner of the property. This UST was located outside the building and was the only UST still in-use. A single dispenser was associated with the gasoline UST.

The final UST was a 1,000 gallon fuel oil tank located on an adjacent residential property under the same ownership as the subject site. In accordance with the state requirements this UST did not require a site assessment, but was incorporated into the scope of services as requested by the site owner. Physical observations and field screening indicated that no contamination existed at the UST located at the residence.

3.2 Site History

The subject site was developed around the 1920's and has undergone numerous use and physical changes, but has mainly been utilized as an automobile service station. The site was also utilized as a machine shop. The site was last occupied with a car detailing and washing operation and a lawn mower sales and small equipment repair shop.

3.3 Site Geology

The natural soils at the site generally consist of dark colored clay loams with reddish-brown silty clay subsoils. Some isolated areas of black clay loam or mottled silty clay with sandy soils in places were also present below three (3) feet. Drainage is somewhat deficient due to the heavy compact nature of the subsoil clays. Some small quantities of gravel are present in the subsoils.

A review of area well logs indicates that the area of the site consists of clay soils to depths of about 100 feet. Pockets of sand and gravel underlie the clay. Limestone bedrock exists at depths of about 100 to 150 feet. Copies of the well logs are included in Appendix 7.

Groundwater in the area is expected to be present at depths of 18 to 20 feet. Although, fluctuations in precipitation could effect the depth to the groundwater table. Groundwater, within the site and general area is apparently flowing south to southeast in the direction of Lake Michigan.

4.0 TANK SYSTEM REMOVALS

4.1 Tank Removals

The seven (7) USTs, dispensing lines and two (2) pump islands were removed by North Shore Excavating, Inc., between September 1, 1992 and September 3, 1992. A Contingency and Closure Plan was prepared by Key Environmental Services, Inc., and was available on-site during the tank removals. The Contingency and Closure Plan is included in Appendix 2 of this report, along with the Checklist for Tank Closure, tank inventory forms, and receipts for tank disposal. A Checklist for Tank Closure, a tank inventory form and a receipt for the tank disposal is also included for the eighth (8) tank encountered during the remediation activities.

Prior to each tank excavation, product lines were disconnected and any remaining free product was drained into the tanks. Since the tanks were purged through the use of an educator, the drop tubes and vent lines were left intact. In accordance with the American Petroleum Institute (API) Recommended Practice for Tank Removal, the tanks were purged until the atmosphere inside the tank was reduced to less than 10% of the lower explosive limit (LEL). All vapors were released into the outside atmosphere above a height of twelve (12) feet. The tanks were monitored for flammable or combustible gas levels with a combustible gas indicator. Each tank was then exposed to approximately six (6) feet below grade.

After venting was completed the tanks were properly lifted out of the ground and placed on plastic by Northshore Excavating, Inc., personnel in accordance with the WDNR guidelines, cleaned and evaluated. Due to the integrity of the waste oil tank it was cut and cleaned within its respective cavity.

Observation of the tanks following removal indicated extensive corrosion, areas of pitting and numerous holes in the three (3) gasoline tanks and the one (1) diesel tank located within the common cavity. The 500 gallon waste oil tank removed from under the building and the 300 gallon waste oil tank removed during the remediation indicated extensive corrosion and several holes at the bases and seams of the tanks. Photographs taken during the tank removals, are included in Appendix 8.

Following the removal and cleaning of the underground storage tank systems, they were properly transported and disposed of by North Shore Excavating, Inc. The 300 gallon tank removed during remediation was disposed of as scrap metal, at Detinning Corporation of America. The seven (7) tanks previously removed were disposed of at Miller Compressing Co., located in Milwaukee, Wisconsin. Copies of the shipping orders are included in Appendix 2.

4.2 Sludge Management

Approximately 150 gallons of sludge was generated during the tank cleaning activities. Sludge was removed from the tanks and stored on-site in labelled DOT approved 55 gallon drums. Following approval, the drums were transported to Milwaukee Solvents and Chemicals located in Menomonee Falls, for disposal. The sludge generated from the waste oil tank and hydraulic lift ram removed during the remediation still remains on site until proper disposal can be obtained.

4.3 Site Assessment

During the tank removal activities, soil staining and petroleum odors were noted. Field screenings conducted on soil samples collected from the tank cavities and related dispensing lines and islands indicated PID readings as high as 700. Black and gray stained soils were present in the subsequent waste oil, gasoline and diesel cavities and beneath both of the dispensing islands to depths of one (1) to nine (9) feet.

The soil on-site consisted of silty clays with sand and gravel to a depth of eight (8) to fifteen (15) feet. The soils were generally reddish-brown and gray in color with occasional black staining. The fill around the former USTs consisted of sand and gravel. Photographs are included in Appendix 8.

A total of six (6) soil samples were collected and submitted for analysis. One (1) sample was analyzed for Diesel Range Organics (DRO); one (1) sample was analyzed for Total Recoverable

wo → PVOC Pb, cd PCB's

Petroleum Hydrocarbons (TRPH); the other four (4) were analyzed for Gasoline Range Organics (GRO). The sampling and former tank locations are depicted on Figure 2 in Appendix 1 and the results are presented in Table 1. A copy of the analytical test results, and the Chain of Custody is included in Appendix 3.

Since soil contamination was encountered during the tank removals, the Wisconsin Department of Natural Resources (WDNR) was notified as required by the regulatory guidelines. In a letter dated October 6, 1992, Ms. Giselle Red, Program Assistant Environmental Repair Section of the WDNR, assigned this project to a low Priority Ranking Group.

5.0 REMEDIAL INVESTIGATION

5.1 General

The purpose of the Remedial Investigation (RI) was to determine the extent and degree of the plume of contamination in the soil and to assess potential public health concerns. These goals were apparently accomplished by drilling soil borings at various locations at the subject site. The subsequent soil samples collected were classified, field screened and analytically tested for petroleum constituents and the results were used for interpreting the apparent extent of the soil contamination.

5.2 Drilling Procedures

As a result of the contamination encountered, a Remedial Investigation (RI) was conducted around the former UST areas. Five (5) borings were drilled utilizing a truck mounted drilling rig. The borings were designated as B-1, B-2, B-3, B-4, and B-5. The borings were advanced to depths of ten (10) to fifteen (15) feet and were terminated when impacts were no longer detected in the field. Groundwater was not encountered in any of the borings. Samples were collected from the borings at 2.5 foot intervals for classification, field screening and subsequent analysis. The location of the borings are illustrated on Figure 3 in Appendix 1.

Soil samples were collected in five (5) separate containers. Laboratory supplied 60 ml wide-mouthed glass jars with a teflon cap for both GRO and DRO and a methanol preservative to be added in the field to samples submitted for GRO. An 8-ounce glass jar for field screening and soil classification. A 4-ounce glass jar with teflon cap for Petroleum Volatile Organic Compounds (PVOCs), and a 2-ounce glass jar for dry weight. The 60 ml glass jars, 4-ounce glass jars and 2-ounce glass jar were immediately placed on ice in a cooler. The samples were subsequently refrigerated until submittal to the laboratory for testing.

The 8-ounce soil samples were field screened using an MSA Photo-Ionization Detector (PID) equipped with a 10.6 eV lamp, calibrated to isobutylene the morning of the field work. The sealed container was first allowed to warm to about 70° Fahrenheit. The lid of the container was then slightly opened and the tip of the PID was inserted into the headspace and a reading was recorded. The PID provides a quantitative measure of Volatile Organic Compounds with ionization potentials less than 10.6 eV.

All downhole drilling equipment and split spoon samplers were washed between each use to avoid cross-contamination. The drilling equipment was cleaned with a hot water pressure washer and the samplers were washed in an Alconox detergent and double rinsed in municipal water.

The boreholes were filled with Bentonite chips to prevent groundwater infiltration. Copies of the Boring Logs and Borehole Abandonment Forms are included in Appendix 4.

Twenty-one (21) soil samples were obtained from the borings. Four (4) of the twenty-one (21) samples were submitted for analysis of Gasoline Range Organics (GRO) and three (3) for Diesel Range Organics (DRO). In addition, two (2) of the four (4) samples were also submitted for analysis of Petroleum Volatile Organic Compounds (PVOCs) to assist in verifying that the extent of contamination was determined. The results of the field screening and laboratory analysis are presented in Table 2 and Table 3. Copies of the test results as received from the laboratory, along with the Chain of Custodies are included in Appendix 4.

TABLE 2
REMEDIAL INVESTIGATION
FIELD AND LABORATORY RESULTS - SOIL (DRO/GRO)

TABLE 3
REMEDIAL INVESTIGATION
FIELD AND LABORATORY RESULTS - SOIL (PVOCS)

SAMPLE NUMBER	B-2	B-5
PID READING	14	35
BENZENE	ND	ND
ETHYLBENZENE	ND	ND
METHYL-t-BUTYLETHER	ND	ND
TOLUENE	ND	ND
1,2,4 - TRIMETHYLBENZENE	ND	7.6
1,3,5 - TRIMETHYLBENZENE	ND	ND
M & P - XYLENE	ND	ND
O - XYLENE	ND	5.9

NOTE: All results are expressed in parts per billion, except for the PID readings which have no units of measurement.

One (1) of the four (4) samples analyzed (B-5) indicated a concentration of Gasoline Range Organics (GRO) in the soil. The concentration was below the DNR guideline of 10 parts per million (ppm). Concentrations of Petroleum Volatile Organic Compounds (PVOCs) were detected in sample B-5; however, the DNR has not established allowable limits for PVOCs in soils. The concentrations encountered are significantly lower than those encountered in the tank cavities; therefore, based on the field and laboratory testing, the horizontal and vertical depths of the soil contamination were apparently determined during the investigation.

5.3 Site Geology

The geology at the site is described using geologic data gathered from the five (5) soil borings conducted at the site in November, 1992. Based on our review, a silty clay layer exists between 0 to 4 feet below grade in borings B-1 and B-2. This soil layer was not encountered in the other borings and does not appear to be continuous across the site. The silty clay exhibits medium stiff to stiff consistencies, and is brown in color.

Fine to coarse sand with trace gravel was encountered in borings B-3, B-4, and B-5 between 2 to 15 feet below grade. This sand exhibits a dense to medium dense consistency, and is brown to grey in color.

6.0 SOIL REMEDIATION

6.1 Landfill Approval

Prior to conducting soil remediation, representative soil samples were collected on September 29, 1992 from the former UST cavities and submitted for laboratory analysis. The impacted soils were to be disposed of at Parkview Recycling and Disposal Facility (owned by Waste Management), located at N96 W13503 County Line Road in Menomonee Falls, Wisconsin. In order to obtain landfill approval, the samples submitted for analysis were tested for the following parameters.

- Percent Free Liquids
- Flashpoint (closed cup)
- Total Lead
- Gasoline Range Organics
- Diesel Range Organics
- Percent Total Solids

A copy of the analytical results and the Chain of Custody are included in Appendix 5, along with a copy of the SWAR form, which was submitted to Waste Management for approval. Landfill approval was obtained and soil remediation was scheduled to begin on January 11, 1993. A copy of form 4400-120, Application to Treat or Dispose of Petroleum Contaminated Soil, is also included in Appendix 5.

6.2 Soil Excavation

The soil remediation activities began on January 11, 1993 and were completed on February 5, 1993. North Shore Excavating, Inc., conducted the soil removal for this project. North Shore Excavating, Inc., excavated the impacted soils, transported the contaminated soils to Parkview Recycling and Disposal Facility and backfilled and graded the resulting excavation with clean imported stone.

Soil removal began in the common cavity area of the four (4) tanks inside the former structure. The excavation then proceeded to the south until the extent of the plume was defined. The excavation then proceeded to the east and to the north, into the former 500 gallon waste oil UST cavity. Soils exhibiting petroleum odors and/or PID readings above 10 ppm were excavated and transferred for disposal. Impacted soils were removed from the site at depths ranging between 1 to 10 feet. Excavation activities were terminated when field screening indicated no further removal of impacted soils to be necessary or when site restrictions prevented further excavation. The excavation proceeded back to the south and west through the common cavity of the former four (4) tanks and towards the dispensing lines and islands along Port Washington Road. At the southern edge of the excavation a utility pole and transformer were present. The excavation went within approximately ten (10) feet of the pole and continued around it. Soil samples were collected to determine if the soils in place near the pole were still impacted. The results indicated that some soil impacts were present, however they were considered minimal and did not warrant removal of the utility pole. As the remediation activities moved to the southwest towards the corner of former building, an underground remote fill pipe was encountered.

The discovered pipe lead towards the southwest corner of the former building foundation and towards the area of the utility pole. Contamination was encountered beneath the piping, so excavation continued in a southwest direction. As the excavation moved outside the former structure, a 300 gallon waste oil UST was encountered. The excavation in that direction stopped until the proper permits could be obtained to remove the tank. On February 5, 1992 North Shore Excavating removed the tank and excavated and disposed of the remaining contaminated soils. The tank contents were placed in one (1) 55 gallon DOT approved drum and disposal has been arranged with Milwaukee Solvents. This tank has been registered as closed by removal. A copy of the Tank Inventory Form, Checklist for tank closure, and receipt for disposal of the tank as scrap are included in Appendix 2.

Impacted soil excavation continued to the west and north. Due to a 20" high pressure Wisconsin Natural Gas Line and a City of Glendale water main located along Port Washington Road, the excavation to the West had to be discontinued. Due to these obstructions, Mr. Richard A. Keyes, a professional engineer with the Milwaukee County Department of Public Works Environmental Services Division, was contacted. Mr. Keyes indicated that excavation would not be permitted within thirteen (13) feet (City of Milwaukee right-of-way) of the curbing of Port Washington Road. Soil samples were collected from the side walls at varying depths and intervals to assess the area of contaminated soils left in place.

There was also a six (6) inch Wisconsin Natural Gas line present along Green Tree Road. Therefore, excavation activities were discontinued within eight (8) feet of Green Tree Road to avoid disrupting the gas line.

The excavation was completed in the area of the former 1,300 gallon gasoline UST at the northeastern end of the property.

One hundred thirty-three (133) truck loads of contaminated soil, representing 2,140 tons (approximately 1,530 cubic yards), were transported to Parkview Landfill for disposal. Following completion of the excavating, the resulting cavity was backfilled with imported stone and graded to elevation. The main excavation was approximately 80 feet by 50 feet in size, with a depth of about 9 feet. The final extent of the excavations are illustrated on Figure 4 in Appendix 1. Photographs are also included in Appendix 8.

No groundwater was encountered throughout the seven (7) day excavation and backfilling activities.

6.3 Field Screening and Laboratory Analysis

One (1) soil sample was collected from every truck load and field screened. In accordance with the regulations, one (1) sample per 300 cubic yards of contaminated soil removed from the excavation, was submitted to a certified laboratory for analytical testing. A total of soil 133 samples were collected and screened to verify that contamination was present. Table 4 presents the results of the field screening conducted on the impacted soils.

1/16/93	T-112	174			

In addition, four (4) samples (one (1) per every 300 cubic yards) were submitted for laboratory analysis of Gasoline Range Organics (GRO) or Diesel Range Organics (DRO). Table 5 presents the results of the laboratory analysis. A copy of the results along with the chain of custody is included in Appendix 6.

TABLE 5

DRO/GRO ANALYSIS - CONTAMINATED SOILS

TRUCK NUMBER	PID	DRO	GRO (ppm)
T-20	224	1,600	3,300
T-40	531	NT	1,300
T-60	1,618	NT	860
T-80	892	NT	BQL

NOTE: ppm = parts per million
NT = Not Tested

Based on the results of the field and laboratory testing, it is apparent that the soils removed from the excavation and transported for disposal were above the DNR guideline of 10 parts per million and therefore, considered contaminated.

6.4 Final Excavation Samples

Sixty-five (65) soil samples were collected from the walls and bases of the final excavations. The samples were field screened to determine if impacts were no longer present in the soils. Table 4 presents the results of the field screening conducted on the samples collected from the final excavation. The location of the samples are illustrated on Figure 4 in Appendix 1.

The samples with PID readings above 10 ppm were considered impacted, and were subsequently removed when practicable. When site restrictions prevented further soil removal, a sample was collected and submitted for analysis to determine the degree of impacts remaining.

Twenty-three (23) of the sixty-five (65) soil samples were submitted to a certified laboratory for analysis of either Gasoline Range Organics (GRO), Diesel Range Organics (DRO), and/or Total Recoverable Petroleum Hydrocarbons (TRPH). In addition, six (6) of the twenty-three (23) samples were analyzed for Petroleum Volatile Organics (PVOCs) and Total Lead. Table 7 and Table 8 present the results of the laboratory analysis. A copy of the results along with the Chain of Custodies are also included in Appendix 6.

NOTE: ppm = parts per million
ppb = parts per billion
BQL = Below Quantification Limits

The GRO results in Table 7 were compared to the DNR guideline of 10 ppm. Six (6) of the twenty-three (23) soil samples analyzed indicated a concentration above 10 ppm. Sample Nos. SW-26 and SW-25, collected from depths of 6 and 7 feet respectively, along the southwest wall near the utility pole obstruction, registered a GRO concentration of 150 ppm and 15.6 ppm. Although, the concentrations are above the DNR guideline limit, the impacted soils could not be effectively removed from this location of the site. Sample Nos. SW-38, SW-29 and SW-46 were collected from the west sidewall in the area of the former dispensing islands and lines, near Port Washington Road. Sample No. SW-41 was collected from the north sidewall of excavation #3 near the gasoline along Green Tree Road. The remaining eighteen (18) samples tested, indicated concentrations of GRO or DRO below 10 ppm.

A concentration of 13 ppm TRPH was detected in sample SB-62, collected from the former waste oil, diesel tank area. This concentration is above the DNR guideline, however it is considered to represent residual petroleum in soil and, therefore, insignificant in respect to the concentration of the impacted soils removed from the site.

PVOC concentrations in soil are not regulated by the DNR. However, the testing is conducted to determine if petroleum constituents remain in the soils left in place. Detectable concentrations of PVOCs were indicated in three (3) of the six (6) soil samples analyzed with SW-46 collected from the west wall registering the highest concentrations of PVOCs.

Total Lead levels in soil are also not regulated by the DNR. Total Lead concentrations below 100 ppm are generally not considered significant. The results indicate that the six (6) soil samples contain Total Lead concentrations less than 12 ppm.

7.0 CONCLUSIONS AND RECOMMENDATIONS

7.1 Conclusions

Gasoline, Diesel, and waste oil contaminated soils were encountered during the removal of seven (7) USTs, dispensing lines and two (2) pump islands. A Remedial Investigation conducted following the UST removals determined the extent of the soil impacts. Landfill approval was obtained and the impacted soils were excavated and transported to Parkview Recycling and Disposal Facility for disposal. Field PID screening and laboratory testing conducted on soil samples collected from the soils left-in-place indicated that an effective soil remediation program was accomplished where excavation was possible. In addition, the screening and laboratory testing indicated that the soils which were removed and disposed of, were contaminated.

Impacted soil was left-in place beneath a utility pole and along two (2) gas main lines, located along the west and north property boundaries. These soils are located on the right-of-way property owned by Milwaukee County (west) and the City of Glendale (north). It is not feasible to conduct further remedial action at these locations without risking rupture of the gas lines. In addition the owners of the property will not permit access to the impacted area. It is estimated that about 250 cubic yards of contaminated soil exits off site to the north and west.

Groundwater was not encountered during the tank removals, remedial investigation activities, or the six (6) day soil remediation project. Therefore, groundwater impacts were not addressed for the site and a groundwater investigation program was not considered warranted. The groundwater table on-site, is apparently present at a depths below 15 feet. Soil samples collected and analyzed from various locations between 6 and 10 feet indicated no detectable concentrations of GRO.

It is therefore concluded that an effective soil remediation program was accomplished at the site and no further action is considered warranted.

7.2 Recommendations

Since an effective soil remediation program was accomplished at the site, Key Environmental Services, Inc. recommends that no further remediation be conducted.

A copy of this report should be submitted to the DNR for review and approval. In addition, a copy should be forwarded to the Department of Industry, Labor and Human Relations (DILHR), since the costs relating to remediation of the soils are eligible for reimbursement under the Petroleum Environmental Clean-up Fund Act (PECFA). DILHR oversees the distribution of funds for the PECFA program.

8.0 GENERAL QUALIFICATIONS

The results, interpretation, conclusions and recommendations presented in this report are based on the data collected during the completion of this project, and the samples obtained from the locations identified. Variations in soil and groundwater conditions exist at different locations at most sites. The facts presented in this report are subject to professional interpretation. Changes or modifications to the site may change the findings and conclusions of this report.

This report has been prepared at the request of Mrs. Alice Wilson and Mrs. Marilyn Allen. The contents of this report are the property of Key Environmental Services, Inc., and may not be used for purposes other than the clients intended use without the permission of Mrs. Alice Wilson, Mrs. Marilyn Allen and Key Environmental Services, Inc.

A check in a checkbox indicates a positive or "yes" response

Site #13

Pick n' Save + Retail Stores & Restaurants (former Shore Health & Rehab Center)
6969 N. Port Washington Road
N. Port Washington Rd: STA 00+00 to 12+35 LT

The site is identified on the ERP (BRRTS #02-41-184550), LUST (BRRTS #03-41-003107 and #03-41-489659), UST, and EDR Historic Cleaners databases. Based on field reconnaissance, the site currently consists of Pick N Save / Retail Stores / Restaurants. Review of the Milwaukee County Automated Mapping and Land Information System online indicated that the site is owned by GENERAL CAPITAL / LA MACCHIA SHORES L.L.C. [Ref. 1].

According to the WDATCP Storage Tank Database, four tanks are registered to the site with a street address of 6925 N. Port Washington Road [Ref. 2]. One 1,500-gallon and one 6,000-gallon fuel oil USTs were closed / removed from the site in 1993. One 2,000-gallon fuel oil UST was closed / removed from the site in 2001. One 6,000-gallon fuel oil UST was closed / removed from the site in 2004.

According to the EDR report, no Sanborn Map coverage is available for the project corridor.

Himalayan's review of historical aerial photographs indicates the site has been part of four previously contiguous properties that all contained various buildings (hotel, healthcare center, bicycle sales/repair, liquor store, etc.), prior to their demolition in 2005. The current building and parking lot has remained the same over the past 10 years.

BRRTS #02-41-184550: Based on WDNR records, a hydraulic oil release occurred at the site (The Shores Transitional Care and Rehabilitation Institute – 6925 N. Port Washington Road) in February 1998. An elevator system at the healthcare facility released hydraulic oil into the shaft area. Advent Environmental Services, Inc. (Advent) supervised the off-site removal of absorbent sand placed into the shaft area. Advent concluded that the release was limited to the shaft area and recommended "closure status" be granted for the site [Ref. 5]. This ERP site was granted closure by the Wisconsin DNR, in August 1998.

BRRTS #03-41-003107: Based on WDNR records, this LUST site was associated with petroleum released from USTs that were closed / removed from the site in 1993. However, it appears that no further investigation activities were ever recorded for this LUST site and the property address (1625 N. Port Washington Road) is not correctly identified. The four previous addresses associated with the current property were 6925, 6933, 6945, and 6955 N. Port Washington Road, so the UST locations and possibly the UST details might also be incorrect.

This LUST site was eventually grouped with LUST investigation work (BRRTS #03-41-489659) performed at the site in 2004, when four adjoining properties were re-developed into the current Pick N Save / Strip mall and parking lot area (see below).

BRRTS #03-41-489659: Based on WDNR records, this LUST site was associated with the re-development of several adjoining properties that were eventually replaced with a shopping mall and parking lot in 2004. ARCADIS performed several investigation and remediation activities in conjunction with this re-development, to address several environmental issues present at these properties [Ref. 4].

Besides the tank closure assessment / spill response associated with the 2,000-gallon and 6,000-gallon fuel oil USTs located near the former healthcare facility (6925 N. Port Washington Road), ARCADIS also investigated the potential petroleum impacts from a former 500-gallon gasoline UST located behind the former florist building (6933 N. Port Washington Road), and remediated the hydraulic oil impacts encountered underneath the elevator shaft at the former healthcare facility. Investigation activities included soil borings, temporary monitoring wells, and collection of soil samples for lab analyses. Remediation activities included off-site disposal of impacted soil and off-site discharge of impacted water that accumulated in the excavations.

Based on the investigation results, ARCADIS concluded that no further investigation or remediation was warranted for the site and recommended "closure status" be granted for the site [Ref. 5]. Both LUST sites were granted closure by the WDNR, in September 2004.

Geology / Hydrogeology

Based on ARCADIS's site investigation and remediation activities, the subsurface soils at the site consists of 4 to 8 feet of clay fill with rock aggregate, near the surface, with native brown clayey silt underneath. The excavation walls were described as "tight clay" with limited infiltration due to the low permeability clays [Ref. 4].

No groundwater was encountered in the soil borings or temporary monitoring wells, at a maximum depth of 20 feet bgs. ARCADIS indicated that the water encountered in the excavation, during remediation activities, was only due to rainwater accumulation [Ref. 4].

Soil Impacts

No residual soil impacts were noted in the Advent investigation [Ref. 3]. According to the ARCADIS report, petroleum impacted soil at the site was confined to the former tank beds and below the former elevator shaft. A combined total of about 1,500 tons of impacted soil was removed / disposed off-site, during the UST closure activities and during excavation underneath the former elevator shaft. ARCADIS's field-screening and lab analyses results from soil samples collected from borings, tank beds, and the former UST and building excavation; indicated that VOCs and PAHs were either not detected or were below the applicable the NR 720 or Interim RCLs [Ref. 3, 4]. DRO (6.7 to 172 mg/kg.) was detected at concentrations below the NR 720 RCL.

The minimum distance of the residual soil impacts near the former elevator shaft to the location of proposed construction in the N. Port Washington Road and W. Green Tree Road right of ways is approximately 40 feet. The minimum distance of the residual soil impacts near the former 6,000-gallon fuel oil UST to the location of proposed construction in the N. Port Washington Road R/W is approximately 400 feet.

Groundwater Impacts

No residual groundwater impacts were noted in the Advent investigation [Ref. 3]. According to the ARCADIS report, no groundwater was encountered during investigation activities. However, water was encountered in the excavations during remediation activities. ARCADIS noted that this water was due to rainwater accumulation and the oil/water mixture encountered in the excavations was due to an accidental rupture of the 6,000-gallon fuel oil tank when a foundation wall was removed. Almost 100,000 gallons of oil/water mixture was eventually pumped out of the excavations, during remediation activities, and was discharged to the local sanitary sewer system [Ref. 4].

Residual groundwater impacts appear to be limited to rainfall retention in a former excavation, and most of the excavation was later de-watered. Based on ARCADIS's assessment of local groundwater conditions, it appears that the potential contaminant plume from this site is more than 400 feet from the N. Port Washington Road and W. Green Tree Road right of ways.

Construction / Real Estate Requirements

Based on the proposed design plans, the maximum depths of excavation adjacent to the site are anticipated to be about 14 feet bgs.

No right of way (FEE) strip acquisition or TLE is anticipated at the site

Recommendations

Considering the low levels of petroleum impacted soil remaining at the site and distance from the N. Port Washington Road and W. Green Tree Road right of ways (> 400 feet), this site is unlikely to impact the proposed improvements. Therefore, no further investigation is recommended for the site.

The need for further investigation could be re-evaluated once construction and/or real estate requirements have been finalized.

Refer to the attached Hazardous Materials Assessment Site Summary, site-specific figure(s), and / or pertinent excerpts for more detailed information on the site.

Subject: Certification of Eligibility for Federal Brownfields Tax Incentive of the U.S. Taxpayer Relief Act for Property at 6969 N. Port Washington Road, Glendale, WI 53217

Dear Ms. Nenning:

This letter is to certify that the information on the Pre-Certification Form 4400-206 submitted on March 21, 2005, for the property known as Greentree Health Care/ Shore Redevelopment Project located at 6969 N. Port Washington Road in Glendale, Wisconsin, meets the U.S. Taxpayer Relief Act (HR 2014/PL 105-34) requirements. The requirements that have been met are:

- the property is one on which there has been a release, threat of release, or disposal of any non-petroleum federally-defined hazardous substance, excluding any found in building products; and
- the property is not a site on EPA's National Priorities List (Superfund sites).

The DNR has on record your signed Pre-Certification Form attesting that the property meets the aforementioned requirements of the Taxpayer Relief Act.

If you have any questions, please contact Percy Mather, Brownfields Specialist, at (608) 266-9263 or by email to percy.mather@dnr.state.wi.us.

Sincerely,

Mark F. Giesfeldt, P.E., Director
Bureau for Remediation and Redevelopment

Mr. Michael Weiss
General Capital/La Macchia Shores, LLC.
10532 North Port Washington Road
Mequon, WI 53092-5563

Subject: Final Closure for Greentree Health Care/The Shore Redevelopment Project, 6925 North Port Washington Road, Glendale, WI

FID: 241544820
BRRTS: 03-41-003107 & 03-41-486659

Dear Mr. Weiss:

On September 24, 2004 your site as described above was reviewed for closure by the Wisconsin Department of Natural Resources ("the Department"). The Department reviews environmental remediation cases for compliance with state laws and standards to maintain consistency in the closure of these cases.

On September 23, 2004 the Department received from ARCADIS the report, "*Remediation Completion Report, The Shores Development Project, Glendale, Wisconsin*", dated September 20, 2004. The document included the WDNR Case Summary and Close Out Request. ARCADIS successfully completed the investigation and any remediation pertaining to the 6,000-gallon fuel oil UST, 2,000-gallon fuel oil UST, former 500-gallon gasoline UST area, and elevator hydraulic oil spill response and remediation.

Based on the correspondence and data provided, it appears that your case has been remediated to Department standards in accordance with s. NR 726.05, Wis. Admin. Code. The Department considers the case closed and no further investigation, remediation, or other action is required at this time.

Please be aware that this case may be reopened pursuant to s. NR 726.09, Wis. Adm. Code, if additional information regarding site conditions indicates that contamination on or from the site poses a threat to public health, safety or welfare, or the environment.

The Department appreciates the actions you have taken to investigate and remediate the contamination at this site. If you have any questions or comments, please feel free to contact me at the above address or at (414) 263-8644. Please refer to the FID

number at the top of this letter in any future correspondence. Future correspondence should be sent directly to the Remediation and Redevelopment Program Assistant Vicky Stovall (414-263-8688) at the above address.

Sincerely,

John J. Hnat, P. G.
Senior Hydrogeologist

Dear Mr. Hnat:

Enclosed please find one copy of the Remediation Completion Report that has been prepared for The Shores Redevelopment Project in Glendale, Wisconsin. On behalf of General Capital/La Macchia Shores LLC, ARCADIS is requesting an NR 726 Closure Letter from the Wisconsin Department of Natural Resources for the remedial actions performed at the Site. A $750 check is included with this submittal to cover your review fees.

We greatly appreciate your attention to this matter and we look forward to receiving your written response to the Remediation Completion Report. Should you have any questions, please contact the undersigned at (414) 276-7742.

Sincerely,

ARCADIS G&M, Inc.

Michael S. Maierle, PE
Area Manager

Introduction

General Capital/La Macchia Shores LLC is in the process of redeveloping the Shores Health and Rehabilitation Center (Shores) and three adjacent properties (Wheel & Sprocket, Otto's Beverage Center, and the Flower Studio) in Glendale, Wisconsin. These properties are combined into one redevelopment project, and collectively are defined as the "Site." The previous structures on-Site have been recently demolished, and the Site will be redeveloped as a retail center anchored by a new grocery store.

ARCADIS has been retained to address the environmental issues present at the Site, which include petroleum hydrocarbon impacts identified during previous investigations. ARCADIS developed a Remedial Action Plan (RAP) to address the environmental issues at the Site, and the RAP was approved by the Wisconsin Department of Natural Resources (WDNR) in a letter dated October 3, 2003. This document presents a summary of the remedial actions performed at the following areas of the Site:

- Bureau for Remediation and Redevelopment Tracking System (BRRTS) #03-41-003107 and #03-41-489659: 6,000-gallon fuel oil underground storage tank (UST) remediation and spill response. The tank was located adjacent to the northeast corner of the Shores five-story building.

- Former 2,000-gallon fuel oil UST area remediation. The former tank was located along the southern end of the Shores annex building.

- Former 500-gallon gasoline UST area investigation. The reported former tank was located west of the Flower Studio property.

- Elevator hydraulic oil spill response and remediation. The hydraulic oil spill was located at the base of the former elevator shaft at the Shores 5-story building.

The remedial actions were successful in remediating contamination that was present at the Site and achieving all applicable cleanup standards. Thus, on behalf of General Capital/La Macchia Shores LLC, ARCADIS requests an NR 726 Closure Letter from the WDNR for the Site.

The NR 712 Personnel Certification is included as Appendix A, and the WDNR Case Summary and Close Out Request form is included as Appendix B.

General Information

This section presents the general information required by NR 724.05(2)(e)(2).

Site Location

The Site is comprised of four individual properties: 1) the Shores Health & Rehabilitation Center (Shores) facility (6925 North Port Washington Road); 2) Otto's Beverage Center (6945 North Port Washington Road); 3) Wheel & Sprocket Bike Shop (6955 North Port Washington Road); and, 4) The Flower Studio (6933 North Port

Washington Road). These four contiguous properties are bordered by W. Green Tree Road to the north, N. Port Washington Road to the east, Interstate Highway I-43 to the west, and Nicolet High School tennis courts and soccer fields to the south. The subject properties are located in the northwest ¼ of the northeast ¼ of U.S. Public Land Survey Section No. 20, Township 8 North, Range 22 East, Milwaukee County, Wisconsin. The Site location is shown on Figure 1.

Site Description

The Site covers an area of approximately 6 acres, and was previously developed with four buildings and other miscellaneous structures. These buildings have recently been demolished, and the Site will be redeveloped as a retail center anchored by a new grocery store. The overall layout of the Site is shown on Figure 2.

The Shores consisted of a main 5-story building, commonly referred to as "The Towers", and a 2-story annex on the south end of The Towers. The Towers was constructed in the mid-1960s and was utilized as a nursing home. The annex was constructed in the 1970s and was used for health rehabilitation services. A basement and subbasement existed under portions of the facility. The Shores facility was vacant after it closed operations in the late 1990s.

The Otto's Beverage Center property was developed with a single-story building, with a full basement. This building was utilized as a retail store for beer, wine, and spirits. The Wheel & Sprocket Bike Shop property was developed with a single-story building, also having a full basement. This building was utilized for retail sales and repair of bicycles, fitness equipment, and related products (e.g., exercise clothing). The Flower Studio property was developed with a single-story building, also with a full basement. This building was utilized as a retail floral store.

Prior to the demolition activities, the Site was relatively flat with approximately 15 feet of relief from north to south and from east to west. The nearest body of surface water is the Milwaukee River, which is approximately 0.4 miles southwest of the Site.

Summary of Investigation and Remediation Activities

6,000 Gallon Fuel Oil UST Remediation/Spill Response

A 6,000-gallon fuel oil UST was located adjacent to the northeast corner of the Shores Towers building (Figure 2). As specified in the WDNR-approved Remedial Action

Plan developed for the Site, the remediation program for the 6,000 gallon fuel oil UST involved removal of the tank, excavation and off-site disposal of impacted soils surrounding the tank, and installation and sampling of temporary groundwater monitoring wells to confirm there are no residual groundwater impacts.

Summary of UST Removal and Spill Response

Prior to initiating the remediation program for the 6,000 gallon fuel oil UST, the demolition crew on-Site (Champion Environmental [Champion]) accidentally punctured the tank when they collapsed a foundation wall proximal to the tank. This occurred on Saturday, June 19, 2004. As a result of the actions of the demolition crew, an estimated 3,000 gallons of an oil/water mixture was released from the tank and flowed to the base of the foundation wall excavation.

A release notification was made to the WDNR and Champion directed Northshore Environmental (Northshore), a licensed spill response contractor, to recover the spilled oil/water mixture, remove the tank, and excavate soils from the tank cavity and the base of the building excavation. A copy of the release notification form submitted to the WDNR is included in Appendix C. Approximately 4,700 gallons of fuel oil was recovered from the UST and spill area and recycled at OSI Environmental, Inc. Northshore also recovered approximately several hundred gallons of the oil/water mixture from the spill area, and collected a representative sample of the mixture for profiling and disposal purposes. The oil/water mixture recovered from the spill area was stored in a holding tank on Site until it was disposed of with an oil/water mixture recovered from a separate spill that occurred at the base of the elevator shaft in the former Shores building. Please refer to the "*Elevator Hydraulic Oil Spill Response*" section for details of the total amount of oil/water mixture disposed of from these two spills.

The UST was removed from the cavity, properly steam-cleaned, wrapped in plastic visqueen, and temporarily stored on-Site prior to disposal. A total of 711.91 tons of impacted soil was also excavated and stockpiled from the tank cavity and spill area. The area of the UST removal and spill area is shown on Figure 3.

Confirmatory Soil Sampling

ARCADIS collected a representative soil sample from the stockpiled soil (Stockpile) for analysis of Diesel Range Organics (DROs) and benzene. The analytical results of the Stockpile sample were used to profile the impacted soils for disposal. ARCADIS

also collected nine post-excavation confirmation soil samples from the limits of the tank cavity and spill area. ARCADIS collected three confirmation soil samples from the remaining sidewalls of the tank cavity (North Sidewall, East Sidewall, and South Sidewall), one confirmation soil sample from the base of the tank cavity (Base 1), and five confirmation soil samples from the base of the excavation within the spill area (Base SW, Base SE, Base Central, Base East, and Base North). Immediately following collection, the soil samples were screened in the field for organic vapors using a photoionization detector (PID). Following completion of the field screening, the stockpile and confirmation soil samples were submitted to Test America, Inc., a state of Wisconsin-certified laboratory, under standard chain-of-custody procedures. The confirmation soil samples were submitted for analysis of Volatile Organic Compounds (VOCs), Polycyclic Aromatic Hydrocarbons (PAHs), and DROs.

The analytical results of all nine post-excavation confirmation soil samples indicated that VOCs, PAHs, and DROs were either not detected above laboratory detection limits or were below the applicable WDNR cleanup standards. The analytical results were compared to the applicable general Residual Contaminant Levels (RCLs) specified in s. NR 720, Wisconsin Administrative Code (WAC) and the WDNR document "*Soil Cleanup Levels for Polycyclic Aromatic Hydrocarbons (PAHs) Interim Guidance*" (WDNR publication RR-519-97, April 1997). In accordance with the provisions of s. NR 720.09(4)(2), WAC, the applicable DRO RCL is 250 milligrams per kilogram due to the low permeability clay at and below the depths of the soil contamination. A summary of the confirmation soil sample analytical results is presented in Table 1 and shown on Figure 4. The laboratory analytical results are included in Appendix D.

Disposal Activities

Following the receipt of the confirmation soil sample analytical results and waste profile acceptance, Northshore proceeded to remove the stockpiled soils, cleaned UST, and oil/water mixture from the Site. A total of 711.91 tons of soil were removed from the site and transported to Waste Management's Orchard Ridge Landfill in Menomonee Falls, Wisconsin for disposal as special waste. Approximately 4,700 gallons of fuel oil was recovered from the UST and spill area and recycled at OSI Environmental, Inc. The oil/water mixture recovered from the spill area was stored in a holding tank on Site until it was disposed of at Waste Management's Orchard Ridge Landfill. Please refer to the "*Elevator Hydraulic Oil Spill Response*" section for details regarding the total amount of oil/water mixture collected and disposed of. A copy of the WDNR's Checklist for Tank Closure form is included in Appendix C. Copies of

the disposal documentation for the impacted soil and recovered oil/water are included in Appendix E. Photographs of the spill cleanup are included in Appendix F.

Drilling Activities

The RAP included the installation of three temporary monitoring wells and collection of grab groundwater samples following the tank removal activities. On July 19, 2004, Probe Technologies advanced three Geoprobe soil borings (TMW-4 through TMW-6) in the area of the former 6,000-gallon UST. The soil borings were continuously sampled to a depth of approximately 6 to 12 feet below ground surface (ft bgs). Soil samples were screened in the field for organic vapors using a PID, and no elevated detections were observed throughout the drilling activities. At Geoprobe Soil Borings TMW-4 and TMW-5, fill material consisting of brown silt with gravels was present to a depth of approximately 5 to 8 ft bgs, followed by brown silty clay to 12 ft bgs. The Geoprobe could not penetrate further than 12 ft bgs due to the tight clay material. Temporary wells, consisting of 1-inch diameter Schedule 40 polyvinyl chloride (PVC) casing and well screen, were installed in these two borings.

At Geoprobe Soil Boring TMW-6, fill material consisting of gravelly silt was present to a depth of approximately 6 ft bgs. Gravels indicative of sewer pipe bedding were present at a depth of 6 ft bgs. Based on its proximity to an underground sewer line, Soil Boring TMW-6 was abandoned and no temporary well was installed. Probe Technologies attempted to install soil borings at three additional locations surrounding the tank area; however, the Geoprobe could not penetrate below a depth of 5 to 8 ft bgs due to the tight clay material and the soil borings were abandoned.

No groundwater was present in the soil borings or temporary wells. Therefore, the temporary monitoring wells were abandoned in accordance with WAC Chapter NR 141 requirements. Copies of the soil borings and abandonment logs are included in Appendix G.

Evaluation of Remedial Actions

The remediation and spill response actions for the 6,000-gallon fuel oil UST have been satisfactorily completed and the post-excavation sampling results are below applicable cleanup standards. No groundwater was encountered in any of the soil borings and temporary wells, and none of the post-excavation soil samples collected within the tight clay beneath the former tank cavity and spill area contained any contaminants above the applicable cleanup standards. Furthermore, there were no apparent

groundwater impacts associated with the 6,000-gallon fuel oil UST due to the low permeability clay soils. Based on the data collected during the remediation activities, no further investigation or remediation appears to be warranted in the area of the former 6,000-gallon fuel oil UST and spill release.

Former 2,000 Gallon Fuel Oil UST Area Remediation

A former 2,000-gallon fuel oil UST was located along the southern end of the Shores annex building (Figure 2). The UST was removed in 2001, but a site assessment was not conducted at that time. As specified in the RAP, the remediation program for the former 2,000 gallon UST area involved removal of remaining buried fill piping associated with the former UST, excavation and off-site disposal of impacted soils within the former tank bed, and installation and sampling of temporary groundwater monitoring wells to confirm there are no residual groundwater impacts.

Removal/Disposal Activities

On July 13 and 14, 2004, Northshore excavated a total of 141.11 tons of soil and backfill from the former tank area. The excavated soil and backfill was transported to Waste Management's Orchard Ridge Landfill in Menomonee Falls, Wisconsin for disposal as special waste. A copy of the disposal documentation is included in Appendix E. Photographs of the soil removal are included in Appendix F.

Confirmatory Soil Sampling

ARCADIS collected five post-excavation confirmation soil samples from the limits of the excavation: four samples from the sidewalls (South UST – South Sidewall, South UST – North Sidewall, South UST – East Sidewall, and South UST – West Sidewall) and one sample from the base of the excavation (South UST – Base). Immediately following collection, the soil samples were screened in the field for organic vapors using a PID. Following completion of the field screening, the confirmation soil samples were submitted to Test America, Inc., a state of Wisconsin-certified laboratory, under standard chain-of-custody procedures. The confirmation soil samples were submitted for analysis of VOCs, PAHs, and DROs.

The analytical results of all five post-excavation confirmation soil samples indicated that VOCs, PAHs, and DROs were either not detected above laboratory detection limits or below the applicable RCLs. A summary of the confirmation soil sample

analytical results is presented in Table 2 and shown on Figure 5. The laboratory analytical results are included in Appendix D.

Following the receipt of the confirmation soil sample analytical results and determination that none of the applicable RCLs were exceeded, the excavation was backfilled to grade and compacted with a vibratory compactor to specifications.

Drilling Activities

The RAP included the installation of three temporary monitoring wells and collection of grab groundwater samples following the excavation activities. On July 19, 2004, Probe Technologies advanced three Geoprobe soil borings (TMW-1 through TMW-3) in the area of the former 2,000-gallon UST. The soil borings were continuously sampled to a depth of approximately 16 to 20 ft bgs. Soil samples were screened in the field for organic vapors using a PID, and no elevated detections were observed throughout the drilling activities. Brown to grayish brown clayey silt to silty clay was present throughout the depth of the soil borings. Coarse grained sand lenses were present from a depth of 0 to 4 ft bgs, and a few small pebbles were observed from 8 to 20 ft bgs in the borings. The Geoprobe could not penetrate further than 16 to 20 ft bgs due to the tight clay material.

Temporary monitoring wells were installed within Soil Borings TMW-1 through TMW-3 to depths of approximately 16 to 20 ft bgs. The temporary monitoring wells consisted of 1-inch diameter Schedule 40 PVC, screened for an interval of 10 feet. ARCADIS attempted to collect grab groundwater samples from the three temporary monitoring wells on July 20, 2004; however, the wells were dry. Because it was apparent that the low permeability clays could not yield any groundwater for sampling purposes, the temporary wells at TMW-1 through TMW-3 were abandoned in accordance with WAC Chapter NR 141 requirements. Copies of the soil borings and abandonment logs are included in Appendix G.

Evaluation of Remedial Actions

The excavation and off-site disposal of impacted soils at the former 2,000-gallon fuel oil UST have been satisfactorily completed. All post-excavation soil sampling results are below applicable cleanup standards (i.e., results are below applicable RCLs) and there was no groundwater encountered in the low permeability clay soils beneath the former tank bed. Based on the data collected during the remediation activities, no

further investigation or remediation appears to be warranted in the area of the former 2,000-gallon fuel oil UST.

Former 500 Gallon Gasoline UST Area Investigation/Remediation

A former 500-gallon gasoline UST was reportedly located to the west of the Flower Studio (Figure 2). The UST was reportedly used for gasoline storage and dispensing by Green Tree Electric, a previous occupant of the building that most recently was occupied by the Flower Studio. No information could be found that documents the closure and removal of this former UST. As specified in the RAP, the investigation program for the reported former 500 gallon UST area involved the advancement and sampling of three soil borings and temporary groundwater monitoring wells. Remediation activities would only be required if the sampling results indicate residual soil or groundwater contamination in the area of the reported former 500-gallon UST.

Drilling and Sampling Activities

On July 19, 2004, Probe Technologies advanced three Geoprobe soil borings (TMW-7 through TMW-9) in the area of the reported former 500-gallon UST. The locations of the soil borings are shown on Figure 6. The soil borings were continuously sampled to a depth of approximately 9.5 to 11 ft bgs. Soil samples were screened in the field for organic vapors using a PID, and no elevated detections were observed throughout the drilling activities. Fill material consisting of brown and black aggregate was present to a depth of approximately 1.5 ft bgs, followed by brown clayey silt to silty clay to the final depth of the borings. The Geoprobe could not penetrate further than 9.5 to 11 ft bgs due to the tight clay material.

ARCADIS collected one soil sample from each soil boring for analysis of VOCs (TMW-7 [11 ft], TMW-8 [11 ft], and TMW-9 [9.5 ft]). Since there were no field indications of potential impacts (i.e., odors, staining, elevated PID readings) from the former tank, the soil samples were collected from the bottom of each soil boring, near the migratory groundwater pathway. Immediately following collection, the soil samples were screened in the field for organic vapors using a PID. Following completion of the field screening, the soil samples were submitted to Test America, Inc., a state of Wisconsin-certified laboratory, under standard chain-of-custody procedures.

The analytical results indicated that VOCs were not detected above laboratory detection limits in any of the three soil samples. A summary of the soil sample

analytical results is presented in Table 3 and shown on Figure 6. The laboratory analytical results are included in Appendix D.

Temporary monitoring wells were installed within the three soil borings to depths of approximately 9.5 to 11 ft bgs. The temporary monitoring wells consisted of 1-inch diameter Schedule 40 PVC. Temporary wells TMW-7 and TMW-8 were screened for an interval of 7.5 feet, and temporary well TMW-9 was screened for an interval of 5 feet. ARCADIS attempted to collect grab groundwater samples from the three temporary monitoring wells on July 20, 2004; however, the wells were dry. Because it was apparent that the low permeability clays could not yield any groundwater for sampling purposes, the temporary wells at TMW-7 through TMW-9 were abandoned in accordance with WAC Chapter NR 141 requirements. Copies of the soil borings and abandonment logs are included in Appendix G.

Evaluation of Investigation

The investigation at the reported former 500-gallon gasoline UST has been satisfactorily completed. The soil sampling results demonstrate that there are no residual contaminants in this area of the Site, and there was no groundwater encountered in the tight clay soils in the area of the former tank. Based on the data collected during the investigation activities, no further investigation or remediation appears to be warranted in the area of the reported former 500-gallon gasoline UST.

Elevator Hydraulic Oil Spill Response

On Friday, July 2, 2004, Northshore observed oil leaking out of the concrete vault at the base of the elevator shaft in the former Shores building (The Towers, see Figure 2). A release notification was made to the WDNR and Northshore was directed to recover the oil/water mixture and to excavate soils that were impacted by the released hydraulic oil. The released oil/water mixture accumulated in the base of the excavation adjacent to the elevator shaft and did not exhibit any infiltration due to the low permeability clays across the base of the excavation. A copy of the release notification form submitted to the WDNR is included in Appendix C.

Response/Disposal Activities

The oil/water mixture that was recovered by Northshore during the spill response was temporarily stored in a Northshore vacuum truck prior to being stored in a holding tank on Site. Historically, a number of hydraulic oils contained polychlorinated biphenyls

(PCBs). Therefore, Northshore submitted a sample of the hydraulic oil to a state of Wisconsin-certified laboratory under standard chain-of-custody procedures for analysis of PCBs. The results confirmed that the spilled hydraulic oil did not contain PCBs, and a copy of the analytical report is included in Appendix D.

Several thousand gallons of water were recovered by Northshore during the spill response due to rain water accumulating in the base of the excavation. On July 13, 2004, Northshore received a permit from the Milwaukee Metropolitan Sewerage District (MMSD) to discharge water recovered during the spill response to the sanitary sewer system. Northshore temporarily stored the recovered oil/water mixture on Site in a large holding tank. The oil was separated and skimmed from the mixture, and the water was filtered prior to discharging to the sanitary sewer. As part of the requirement for discharge, Northshore sampled the effluent for DROs and Total Suspended Solids (TSS). The effluent sample was submitted for analysis at Great Lakes Analytical laboratory. The analytical results of the effluent sample showed the levels of DRO and TSS slightly above the MMSD guidelines. However, since this was a one-time discharge, MMSD accepted the discharge without any additional restrictions. Documentation of the total amount of effluent discharged including the laboratory analytical report was provided to MMSD by Northshore. A copy of this report along with the discharge permit is included in Appendix E.

A total of 89,900 gallons of water were discharged to the MMSD sanitary sewer. An additional 6,000 gallons of water was disposed of at the City of Port Washington Wastewater Treatment Plant. A waste stream profile was established for the separated oil/water mixture, and a total of 3,350 gallons of oil/water mixture were disposed of at Waste Management's Orchard Ridge Landfill in Menomonee Falls, Wisconsin as a special waste. Copies of the disposal documentation are included in Appendix E.

Northshore excavated a total of 612.50 tons of impacted soils from the base of the excavation where the spilled oil/water mixture had migrated to (Figure 7). A representative soil sample was collected by Northshore from the impacted soils for waste profiling purposes. The impacted soil was removed from the Site and transported to Waste Management's Orchard Ridge Landfill in Menomonee Falls, Wisconsin for disposal as special waste. A copy of the disposal documentation for the impacted soil is included in Appendix E. Photographs of the spill cleanup are included in Appendix F.

Confirmatory Soil Sampling

ARCADIS collected six post-excavation confirmation soil samples from the limits of the hydraulic oil spill area (Elevator NW, Elevator NE, Elevator West, Elevator Shaft, Elevator South 1, and Elevator South 2). The post-excavation confirmation soil sample locations are shown on Figure 7. Immediately following collection, the soil samples were screened in the field for organic vapors using a PID. Following completion of the field screening, the stockpile and confirmation soil samples were submitted to Test America, Inc., a state of Wisconsin-certified laboratory, under standard chain-of-custody procedures. The confirmation soil samples were submitted for analysis of DROs.

The analytical results of all six post-excavation confirmation soil samples indicated that DROs were either not detected above laboratory detection limits or were below the applicable WDNR cleanup standards (i.e., results are below applicable RCLs). A summary of the post-excavation confirmation soil sample analytical results is presented in Table 4 and shown on Figure 7. The laboratory analytical results are included in Appendix D.

Evaluation of Remedial Actions

The hydraulic oil spill response and soil removal actions were completed on July 16, 2004. All removal actions have been satisfactorily completed and the post-excavation sampling results are below applicable cleanup standards. Based on the data collected during the remediation activities, no further investigation or remediation appears to be warranted in the area of the hydraulic oil spill release.

As documented in the ARCADIS Phase I Environmental Site Assessment Report for the Shores Redevelopment Project, dated February 9, 2004, WDNR files on record for the Shores property listed a hydraulic fluid leak from the elevator located in The Towers that was reported on September 19, 1997. The Shores retained Northwestern Elevator Company to repair the elevator and contain the leak and Advent Environmental Services to conduct environmental testing. Reportedly, a small pool of hydraulic oil was observed on the concrete floor adjacent to the elevator cylinder shaft. The spilled hydraulic oil and the sand within the cylinder shaft were removed and disposed off-site by Northwestern Elevator Company. According to Northwestern Elevator Company, the system leak was very small (estimated at less than one gallon) and there was no evidence of an appreciable loss of hydraulic fluid (e.g., the elevator did not drift downward when suspended, which typically happens when there is an

appreciable hydraulic oil leak). A closure request was submitted to the WDNR on February 3, 1998, and closure was granted for the incident by the WDNR in a letter dated July 28, 1998. Because the previous hydraulic oil release was closed by the WDNR in 1998 during or shortly before the Shores facility ceased operations, it appears that the recent hydraulic oil release was caused by inadequate decommissioning of the elevator hydraulic system, rather than being related to any historical release events.

Conclusions and Recommendations

ARCADIS was retained by General Capital/La Macchia Shores LLC to address the environmental issues present at the Site, which included petroleum hydrocarbon impacts identified during previous investigations. Remedial actions have been successfully completed for the following areas of the Site:

- BRRTS #03-41-003107 and #03-41-489659: 6,000-gallon fuel oil UST remediation and spill response. The tank was located adjacent to the northeast corner of the Shores five-story building. The UST has been excavated and removed from the Site. A total of 711.91 tons of impacted soil and several hundred gallons of an oil/water mixture were removed from the Site and disposed of at Waste Management's Orchard Ridge Landfill. A total of 4,700 gallons of fuel oil was recovered and recycled at OSI Environmental, Inc. The analytical results of all nine post-excavation confirmation soil samples were below the applicable WDNR cleanup standards, and no groundwater was encountered in the low permeability clays in the area of the former tank.

- Former 2,000-gallon fuel oil UST area remediation. The former tank was located along the southern end of the Shores annex building. A total of 141.11 tons of impacted soil has been removed from the Site and disposed of at Waste Management's Orchard Ridge Landfill. The analytical results of all five post-excavation confirmation soil samples were below the applicable WDNR cleanup standards, and there was no groundwater encountered in the low permeability clay soils surrounding the former tank.

- Former 500-gallon gasoline UST area investigation. The reported former tank was located west of the Flower Studio property. Three Geoprobe soil borings were advanced in the area of the reported former tank. The soil sampling results demonstrate that there are no residual contaminants in this area of the Site, and

there was no groundwater encountered in the low permeability clay soils in the area of the former tank.

- Elevator hydraulic oil spill response and remediation. The hydraulic oil spill was located at the base of the former elevator shaft at the Shores five-story building. A total of 612.50 tons of impacted soil was removed from the Site and disposed of at Waste Management's Orchard Ridge Landfill. A total of 3,350 gallons of an oil/water mixture (combined from the elevator hydraulic oil spill and the 6,000-gallon UST spill) was also removed from the Site and disposed of at Waste Management's Orchard Ridge Landfill. Additionally, a total of 89,900 gallons of water was discharged to the sanitary sewer system under permit from MMSD, and 6,000 gallons of water was disposed of at the City of Port Washington Wastewater Treatment Plant. The analytical results of all six post-excavation confirmation soil samples were below the applicable WDNR cleanup standards.

On behalf of General Capital/La Macchia Shores LLC, ARCADIS requests an NR 726 Closure Letter from the WDNR for the remedial actions performed at the Site.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-VSQG: A review of the RCRA-VSQG list, as provided by EDR, and dated 12/14/2020 has revealed that there is 1 RCRA-VSQG site within approximately 0.25 miles of the target property.

USGS TOPOGRAPHIC MAP

Target Property Map:	5951375 THIENSVILLE, WI
Version Date:	2013

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

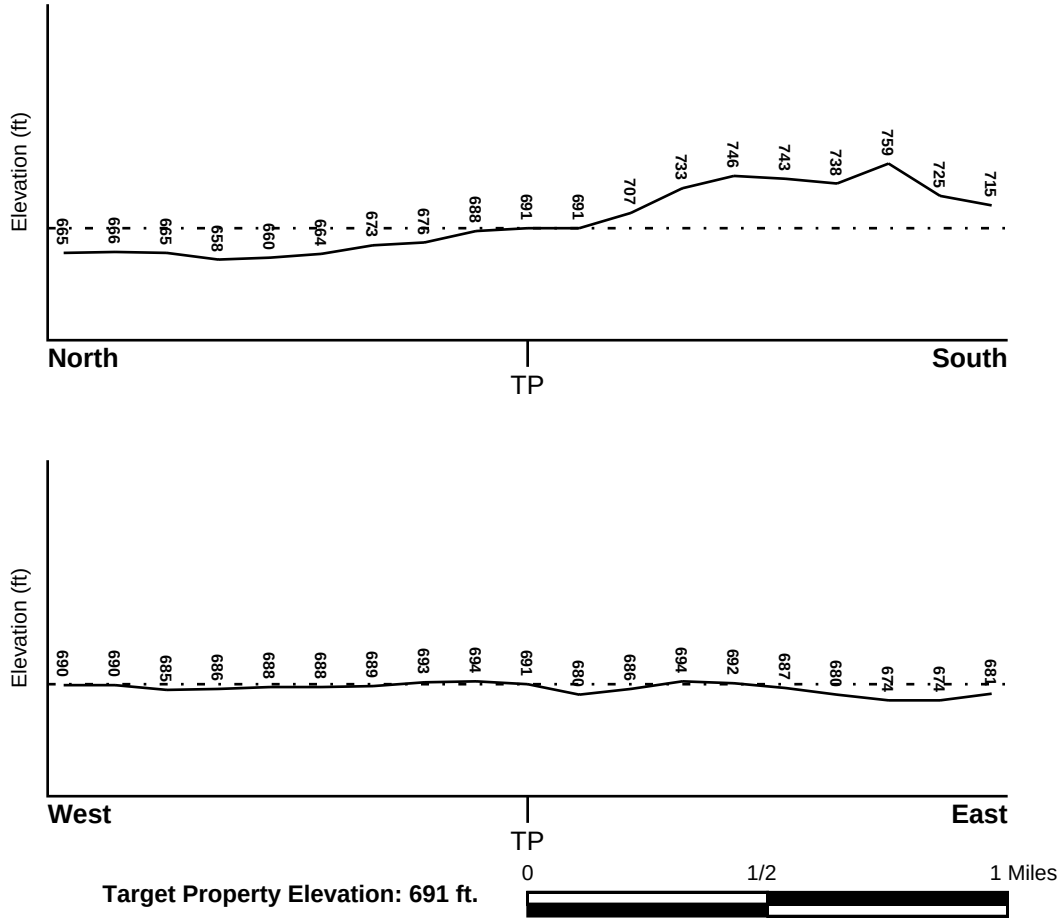
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General North

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
55079C0037E	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
NOT AVAILABLE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
3	1/2 - 1 Mile NNE	N
15	1/2 - 1 Mile North	Not Reported
20	1/2 - 1 Mile ESE	NE
23	1/2 - 1 Mile South	Varies

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
1G	1/2 - 1 Mile North	Not Reported
2G	1/2 - 1 Mile NNE	N
3G	1/2 - 1 Mile ESE	NE
4G	1/2 - 1 Mile South	Varies

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Clayey land

Soil Surface Texture: clay loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 107 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	9 inches	clay loam	Not reported	Not reported	Max: 0 Min:	Max: Min:

Soil Map ID: 2

Soil Component Name: Ozaukee

Soil Surface Texture: silt loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	silt loam	Not reported	Not reported	Max: 4 Min: 0	Max: 8.4 Min: 7.4
2	7 inches	11 inches	silty clay loam	Not reported	Not reported	Max: 4 Min: 0	Max: 8.4 Min: 7.4
3	11 inches	25 inches	silty clay loam	Not reported	Not reported	Max: 4 Min: 0	Max: 8.4 Min: 7.4
4	25 inches	59 inches	silty clay loam	Not reported	Not reported	Max: 4 Min: 0	Max: 8.4 Min: 7.4

Soil Map ID: 3

Soil Component Name: Mequon

Soil Surface Texture: silt loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Somewhat poorly drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 61 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	silt loam	Not reported	Not reported	Max: 4 Min: 1	Max: 8.4 Min: 7.4
2	7 inches	11 inches	silt loam	Not reported	Not reported	Max: 4 Min: 1	Max: 8.4 Min: 7.4
3	11 inches	18 inches	silty clay	Not reported	Not reported	Max: 4 Min: 1	Max: 8.4 Min: 7.4
4	18 inches	25 inches	silty clay loam	Not reported	Not reported	Max: 4 Min: 1	Max: 8.4 Min: 7.4

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
5	25 inches	59 inches	silty clay loam	Not reported	Not reported	Max: 4 Min: 1	Max: 8.4 Min: 7.4

Soil Map ID: 4

Soil Component Name: Ashkum

Soil Surface Texture: silty clay loam

Hydrologic Group: Class B/D - Drained/undrained hydrology class of soils that can be drained and are classified.

Soil Drainage Class: Poorly drained

Hydric Status: All hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	11 inches	silty clay loam	Not reported	Not reported	Max: 4 Min: 1	Max: 8.4 Min: 6.1
2	11 inches	29 inches	silty clay loam	Not reported	Not reported	Max: 4 Min: 1	Max: 8.4 Min: 6.1
3	29 inches	59 inches	silty clay loam	Not reported	Not reported	Max: 4 Min: 1	Max: 8.4 Min: 6.1

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 12/14/2020 has revealed that there are 2 CORRACTS sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
TRADEBE TREATMENT AN EPA ID:: WID988580056	***5611 W HEMLOCK ST***	***WNW 1/4 - 1/2 (0.387 mi.)***	***AB107***	***934***
COMMERCE INDUSTRIAL EPA ID:: WID023375884	***3420 W MILL RD***	***SSE 1/2 - 1 (0.855 mi.)***	***135***	***2302***

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 12/14/2020 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/14/2020 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/14/2020 has revealed that there is 1 RCRA-SQG site within approximately 0.25 miles of the target property.

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 12/14/2020 has revealed that there are 10 RCRA-VSQG sites within approximately 0.25 miles of the target property.

State and tribal landfill and/or solid waste disposal site lists

WI SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Department of Natural Resources' List: All Landfills on License with Location Information/Registry of Waste Disposal Sites.

A review of the WI SWF/LF list, as provided by EDR, and dated 09/24/2020 has revealed that there is 1 WI SWF/LF site within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

WI UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Commerces' List: All Underground Storage Tanks Except for Fuel Oil.

A review of the WI UST list, as provided by EDR, and dated 09/08/2020 has revealed that there are 33 WI UST sites within approximately 0.25 miles of the target property.

State and tribal Brownfields sites

WI BROWNFIELDS: A listing of brownfields sites included in the BRRTS database. Brownfields are abandoned, idle or underused commercial or industrial properties, where the expansion or redevelopment is hindered by

real or perceived contamination. Brownfields vary in size, location, age, and past use -- they can be anything from a five-hundred acre automobile assembly plant to a small, abandoned corner gas station.

A review of the WI BROWNFIELDS list, as provided by EDR, has revealed that there are 6 WI BROWNFIELDS sites within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/14/2020 has revealed that there are 13 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 7 EDR Hist Auto sites within approximately 0.125 miles of the target property.

M & E AUTO REPAIR TU	5115 GOOD HOPE RD W	W 0 - 1/8 (0.080 mi.)	47	381

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 2 EDR Hist Cleaner sites within approximately 0.125 miles of the target property.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Action Date: 12/09/2003 Action Code: 84
Action Name: Remaining Actions Needed
Action Desc: Date DNR sends a letter outlining the remaining actions needed to achieve final closure. The site will not be formally closed until receipt of documentation. This action was formerly known as conditional closure.
Action Comments: *** Conditional Closure from Commerce Data Interchange ***

Action Date: 07/02/1998 Action Code: 35
Action Name: Site Investigation Workplan (SIWP) Received (non-fee)
Action Desc: Date DNR received a site investigation workplan (SIWP) which states the objectives of the site investigation to determine the degree and extent of contamination.
Action Comments: Not reported

Action Date: 02/06/1998 Action Code: 1
Action Name: Notification of Hazardous Substance Discharge
Action Desc: Date DNR received notice of a discharge of a hazardous substance under s. 292.11 Wis. Stats. Discharge was discovered during an environmental assessment or laboratory analysis of soil, sediment, groundwater or vapor samples. Includes historic contamination.
Action Comments: Not reported

Action Date: 02/17/1998 Action Code: 2
Action Name: Responsible Party (RP) letter sent
Action Desc: Date of DNR letter to responsible party (RP) notifying them of state law responsibilities associated with the investigation and cleanup of a hazardous substance discharge to the environment.
Action Comments: Not reported

Action Date: 02/12/2004 Action Code: 11
Action Name: Activity Closed
Action Desc: Date DNR sends a letter approving the final closure of an activity based on data provided and compliance with NR 726 and 727. No further investigation or remediation is required at this time.
Action Comments: *** NR726 Closure from Commerce Data Interchange ***

Action Date: 02/12/2004 Action Code: 232
Action Name: Continuing Obligation - Residual Soil Contamination
Action Desc: Closure or ongoing cleanup was approved with the Continuing Obligation to address residual soil contamination at or above the Residual Contamination Level (RCL) or Site Specific Residual Contaminant Level (SSRCL) per rules, when moved.
Action Comments: *** AUTO POPULATED AT FINAL CLOSURE DUE TO 710 ACTION ***

Action Date: 02/12/2004 Action Code: 236
Action Name: Continuing Obligation - Residual GW Contamination
Action Desc: Closure or ongoing cleanup was approved with the Continuing Obligation for residual groundwater contamination in excess of ch. NR 140 groundwater enforcement standard, to obtain DNR approval before well construction or reconstruction.

HEISER LEASING (NOW==> PRIYA CORP) (Continued) **S103697596**

Action Comments: *** AUTO POPULATED AT FINAL CLOSURE DUE TO 700 ACTION ***

Action Date: 02/03/2005 Action Code: 100
Action Name: CO Packet and GIS QAQC Completed by DNR
Action Desc: Date DNR staff reviewed information within the Continuing Obligations Packet for completeness and readability and the geolocation was confirmed.
Action Comments: AB

Action Date: 03/26/2003 Action Code: 700
Action Name: Database Fee Paid for Groundwater Continuing Obligation(s)
Action Desc: Date fee received for residual groundwater contamination and related continuing obligations.
Action Comments: REC'D CK# 1283 $250.00

Action Date: 03/26/2003 Action Code: 710
Action Name: Database Fee Paid for Soil Continuing Obligation(s)
Action Desc: Date fee received for residual soil contamination and related continuing obligations.
Action Comments: REC'D CK# 1283 $200.00

Action Date: 02/12/2004 Action Code: 46
Action Name: Impacted Right-of-Way (ROW) Notification
Action Desc: Contamination has impacted one or more rights-of-way (ROW). The affected right-of-way (ROW) holders have been notified by the DNR.
Action Comments: AUTO-POPULATED 2018-03-20

Action Date: 02/12/2004 Action Code: 56
Action Name: Continuing Obligation(s) Applied
Action Desc: Closure or ongoing cleanup was approved with one or more continuing obligations to give notice of residual contamination; require or restrict certain actions to protect the public or environment; minimize human or environmental exposures.
Action Comments: AUTO-POPULATED AS REPLACEMENT FOR CODE 50

Action Date: 07/02/2013 Action Code: 89
Action Name: DSPS (formerly Commerce) Transferred Back to DNR
Action Desc: Date the WI Dept of Safety and Professional Services (DSPS) transfers oversight of activity back to the DNR. DSPS was part of the Dept of Commerce until 2011.
Action Comments: PECFA PROGRAM TRANSFER 2013-2015 STATE BUDGET

Action Date: 09/30/2003 Action Code: 37
Action Name: Site Investigation Report (SIR) Received (non-fee)
Action Desc: Date DNR received a site investigation report (SIR) to determine degree & extent of contamination and form a basis for choosing the appropriate remedial action.
Action Comments: *** SITE INVESTIGATION DETERMINED BY DSPS TO BE COMPLETE - FROM DSPS DATA INTERCHANGE ***

Environmental Interest/Information System:

WI-ESR (Wisconsin - Environmental System Registry) is a database that contains core information about facilities, organizations, and people related to Wisconsin's DNR (Department of Natural Resources). RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Action Date: 12/15/2015 Action Code: 56
Action Name: Continuing Obligation(s) Applied
Action Desc: Closure or ongoing cleanup was approved with one or more continuing obligations to give notice of residual contamination; require or restrict certain actions to protect the public or environment; minimize human or environmental exposures.
Action Comments: Not reported

Action Date: 12/15/2015 Action Code: 232
Action Name: Continuing Obligation - Residual Soil Contamination
Action Desc: Closure or ongoing cleanup was approved with the Continuing Obligation to address residual soil contamination at or above the Residual Contamination Level (RCL) or Site Specific Residual

BANNER TOOL FORMER (Continued) **S105887742**

Contaminant Level (SSRCL) per rules, when moved.
Action Comments: Not reported

Action Date: 12/15/2015 Action Code: 222
Action Name: Continuing Obligation - Maintain Cap Over Contaminated Area
Action Desc: Closure or ongoing cleanup was approved with the requirement to maintain a cap or cover to protect against exposure to contaminated soil (direct contact) or to reduce the movement of residual contamination in soil or groundwater.
Action Comments: Not reported

Action Date: 12/15/2015 Action Code: 11
Action Name: Activity Closed
Action Desc: Date DNR sends a letter approving the final closure of an activity based on data provided and compliance with NR 726 and 727. No further investigation or remediation is required at this time.
Action Comments: Not reported

Action Date: 12/15/2015 Action Code: 48
Action Name: Preventative Action Limit (PAL) NR140 Exemption at Closure
Action Desc: DNR has approved site closure with an exemption under NR 140 allowing site closure with groundwater contamination above the preventive action limit (PAL).
Action Comments: BENZO(B) FLUORANTHENE @ MW-1

Action Date: 12/09/2015 Action Code: 99
Action Name: Miscellaneous
Action Desc: Miscellaneous action - See Action Comments
Action Comments: RECEIVED WELL ABANDONMENT FORMS

Action Date: 11/25/2015 8:05:27 AM Action Code: 199
Action Name: Additional Information Received (Fee-Based or Closure)
Action Desc: Date DNR received the additional information that it had requested in order to make a determination on a fee-based or closure submittal.
Action Comments: AR Restart

Action Date: 11/20/2015 3:20:22 PM Action Code: 198
Action Name: Request for Additional Information (Fee-Based or Closure)
Action Desc: Date DNR requests additional information in order to make a determination on a fee-based or closure submittal.
Action Comments: AR Pause

Action Date: 11/20/2015 3:20:22 PM Action Code: 79
Action Name: Case Closure Review Request Received
Action Desc: Date DNR Project Manager determined that the Case Closure - (Form 4400-202) submittal was administratively complete and appropriate fees have been paid for the review.
Action Comments: AUTO-ENTERED

Action Date: 11/13/2015 Action Code: 779
Action Name: Case Closure Review Fee Received
Action Desc: Date DNR received fee for case closure review. Case closure is reviewed for administrative completeness.
Action Comments: REC'D CK #6151 $1050.00

Action Date: 11/20/2015 Action Code: 29

Hazardous Waste Summary:

Waste Code:	D000
Waste Description:	Not Defined
Waste Code:	D001
Waste Description:	IGNITABLE WASTE
Waste Code:	D003
Waste Description:	REACTIVE WASTE
Waste Code:	D007
Waste Description:	CHROMIUM

STRATTEC SECURITY CORP (Continued) **1000234600**

Waste Code: D008
Waste Description: LEAD

Waste Code: D019
Waste Description: CARBON TETRACHLORIDE

Waste Code: D040
Waste Description: TRICHLORETHYLENE

Waste Code: F005
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F006
Waste Description: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS, EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC, AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste Code: F008
Waste Description: PLATING BATH RESIDUES FROM THE BOTTOM OF PLATING BATHS FROM ELECTROPLATING OPERATIONS IN WHICH CYANIDES ARE USED IN THE PROCESS.

Waste Code: NONE
Waste Description: Not Defined

Action Date: 10/16/1991 Action Code: 1
Action Name: Notification of Hazardous Substance Discharge
Action Desc: Date DNR received notice of a discharge of a hazardous substance under s. 292.11 Wis. Stats. Discharge was discovered during an environmental assessment or laboratory analysis of soil, sediment, groundwater or vapor samples. Includes historic contamination.
Action Comments: Not reported

Action Date: 10/28/1994 Action Code: 11
Action Name: Activity Closed
Action Desc: Date DNR sends a letter approving the final closure of an activity based on data provided and compliance with NR 726 and 727. No further investigation or remediation is required at this time.
Action Comments: Not reported

Action Date: 02/14/1994 Action Code: 35
Action Name: Site Investigation Workplan (SIWP) Received (non-fee)
Action Desc: Date DNR received a site investigation workplan (SIWP) which states the objectives of the site investigation to determine the degree and extent of contamination.
Action Comments: SI WORK PLAN RECV'D

Action Date: 11/13/1991 Action Code: 2
Action Name: Responsible Party (RP) letter sent
Action Desc: Date of DNR letter to responsible party (RP) notifying them of state law responsibilities associated with the investigation and cleanup of a hazardous substance discharge to the environment.
Action Comments: RP LETTER

Action Date: 11/13/1991 Action Code: 99
Action Name: Miscellaneous
Action Desc: Miscellaneous action - See Action Comments
Action Comments: CHANGE PRIORITY TO MEDIUM

Action Date: 03/16/1992 Action Code: 33
Action Name: Tank System Site Assessment (TSSA) Report Received
Action Desc: Date DNR received a tank system site assessment (TSSA) regarding tank closure or change in services for an above-ground or underground tank system.
Action Comments: Not reported

Environmental Interest/Information System:
WI-ESR (Wisconsin - Environmental System Registry) is a database that contains core information about facilities, organizations, and people related to Wisconsin's DNR (Department of Natural Resources).
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CREATIVE MAINTENANCE SOLUTIONS (Continued) **1004800743**

WI-ESR (Wisconsin - Environmental System Registry) is a database that contains core information about facilities, organizations, and people related to Wisconsin's DNR (Department of Natural Resources). RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
WI-ESR (Wisconsin - Environmental System Registry) is a database that contains core information about facilities, organizations, and people related to Wisconsin's DNR (Department of Natural Resources). RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
